McKinsey launched an internal study whose title included the phrase knowledge management in 1987 (Manville, personal communication, 2007). Prusak, another acknowledged pioneers of the field, in a very corroborative and independent communication, reports that Ernst and Young started using the term in 1992, and that McKinsey & Co. was using it “a bit earlier - 1988?” (Prusak, personal communication, 2007).

In the article entitled “Where Did Knowledge Management Come From” written in 1999, Prusak described KM as originating “about 7 years ago,” i.e., in 1992, and describes what appears to be the first conference organized specifically on the topic of KM, held in Boston in the spring of 1993, as “a good milestone to mark the beginning of the knowledge management time-line.”^[3] The conference, organized and sponsored by the Center for Business Strategy at Ernst and Young, was held at the Four Seasons Hotel (Prusak, personal communication, 2007).

BACKGROUND

While KM as it is known today came out of the consulting world, the concepts of managing knowledge can be traced back to earlier works in the fields of government intelligence and policy management. Early works often cite

Organizational Intelligence: Knowledge and Policy in Government and Industry by Wilensky.^[4] In his book, Wilensky discussed the value of the “Knowledge Expert” as being the primary source of reliable information in the “Intelligence Field” of the government. So it should not be ignored that KM did have roots inside of other disciplines that are not directly related to the technology consulting firms.

KM, as the term is understood today however, did arise basically in the consulting world, and it was they that publicized it. The consulting firms quickly realized the potential of the intranet flavor of the Internet for linking together their own geographically dispersed knowledge-based organizations. They then quickly realized that the expertise they had gained was a product that could be marketed and sold to other organizations. That product needed a name, and the name chosen was knowledge management. In his article on where KM came from, Prusak in fact felt it appropriate to say “some skeptics may believe that consultants developed knowledge management to replace declining revenues from the waning re-engineering movement.”^[3] The two enthusiasms are related in that both were driven by increased ICT capabilities, but the timing, though convenient for the consulting firms was driven not by their convenience, but by the straightforward dynamics of ICT capability growth. The KM was dependent upon the Internet, while pre-Internet ICT already enabled the major restructuring of an organization’s work flows and processes. In a sense, KM also has roots in the implementation of supply chain management (SCM) software and business process re-engineering (BPR) as well as the more recent development of enterprise resource planning (ERP). IT development has always had a pattern, an oft repeated pattern, of growth from addressing more structured data to addressing less tractable, less well structured, or comparatively unstructured data. Remember that text processing was at one time called “string handling,” because to people brought up on handling numeric data, text was most conveniently thought of, not as words, but as a string of symbols to be manipulated. In that sense, SCM and BPR and ERP to KM, is simply a logical and predictable progression.

DEFINITION

A good functional and illustrative definition of KM and how it developed is the equestrian metaphor of “by the intranet out of intellectual capital.”^[5] By this definition, KM has two parents, the enthusiasm for and the appreciation of IC, and the development of the Internet and its offspring, intranets and extranets. The IC is essentially a name given to the recognition of the importance of information and knowledge. It represented the awareness that as Drucker (Hibbard (p. 46)^[6]) put it:

We now know that the source of wealth is something, specifically human knowledge. If we apply knowledge to tasks that we obviously know how to do, we call it productivity. If we apply knowledge to tasks that are new and different, we call it innovation. Only knowledge allows us to achieve those two goals.

Indeed Drucker is clearly one of the intellectual fathers of KM. His *Post-Capitalist Society* which appeared in 1993, is about the shift from capitalism to the knowledge society. Almost one full page of an 11-page index is devoted to knowledge or knowledge phrases such as knowledge workers, yet the phrase knowledge management is surprisingly absent.^[7] The early use of the phrase knowledge management is sometimes attributed to Drucker, but at this point it appears to be still unsubstantiated. Given Drucker’s stature and his emphasis on knowledge and knowledge workers it is almost inevitable that such an attribution would arise. It may be noted however that while Drucker did, carefully, claim a first for the phrase “Knowledge Worker,” he does not appear to have made any similar claim for the phrase “Knowledge Management,” and he was certainly active and involved well into the time frame in which he might well have, and likely would have, made such a claim if he thought it warranted.

It is beyond the scope of this entry to pursue the development of the IC in detail, and that is covered elsewhere.^[8–10] However, a brief review of the development of IC is vital to understanding the origins and development of KM.

A pioneer in the KM field was Sveiby.^[11] His book *The Invisible Balance Sheet* (1989) was a key work in the development of thinking about IC. His principal point was precisely that the important assets of an organization did not show up on the balance sheet, and that in thinking about a company’s assets one should think, as it were, in terms of an invisible balance sheet. From that starting point, his writings morphed smoothly and rapidly into KM. The work of Robert Buckman at Buckman Laboratories^[12] and Hubert St. Onge at the Canadian Imperial Bank of Commerce^[13] were key players in operationalizing the concept and in popularizing IC. Perhaps most important in bringing the concept of IC to the business community was Stewart’s^[14] article in *Fortune* magazine, “Intellectual Capital, Your Company’s Most Valuable Asset.”

The first blush of enthusiasm for IC centered on quantifying and measuring it.^[15,16] Surely if it was so important, it needed to be measured. As the difficulty of measuring such an amorphous commodity as information, much less knowledge became apparent to the business community the enthusiasm for, or at least the publication of articles about, IC subsided. Then the Internet emerged. The business world realized that the Internet could be used to link an organization together. This was the take-off point for KM.^[8,9] KM was first defined as having two components (Fig. 1).

Fig. 1 Early conception of KM.

Information and knowledge capital was the organization's information and knowledge, but including the informal and unstructured, the implicit and tacit, as well as the formal.

The structural capital was the mechanisms in place to take advantage of the information and knowledge capital, the mechanisms to capture, store, retrieve, and communicate that information and knowledge. The phrase that has emerged that largely represents what was meant by KM's structural capital, is content management (CM), or its variant, ECM, electronic content management. As they are now used, these phrases are typically used in the context of the software packages used to facilitate CM or KM.

The transition from IC to KM is clearly seen in Peters 1992 book *Liberation Management*.^[17] Peters has four chapters specifically entitled "Knowledge Management Structures (KMS)" (I–IV: Taking Knowledge Management Seriously; Getting Physical; Knowledge Bases, Expert Systems, Computer Augmented Collaboration; and Developing and Tapping Expert Power in the Hierarchy-less Organization), almost 10% of a very large book. The KMS phrase rapidly withered away in favor of the simpler KM, but Peters was clearly writing about KM as it was becoming to be understood.

Applications of Internet technology were soon extended beyond intranets, the use of the Internet within an organization, to extranets that would still be private, but were used to connect an organization with its suppliers and customers. The consequence of this development was an expanded definition of KM to include the customer's knowledge and input, customer capital (Fig. 2).

The inclusion of customer capital was also not unrelated to the popularity of TQM, total quality management, in which responding to customer need and demand was a key element.

Concurrent with IC, sharing the same etiology, and very much reinforcing IC was the notion of the "Balanced Score Card."^[18] The idea behind the balanced score card was that traditional financial reporting was too narrow in its outlook, and that in effect Sveiby's "Invisible Balance Sheet" should be added to a company's "score card" to make it balanced. In particular the concern was that the traditional balance sheet focused only on the present and on the past, with no thought to the future. Using only traditional financial indicators, if the current balance sheet

Fig. 2 Expanded conception of KM.

looks good, but for example customers have begun to defect to the competition, there is nothing to reveal that the situation is in fact not healthy. The exposition of the balanced score card recognized the difficulty of measuring IC per se, recognized its importance, but principally sought other non-financial indicators such as product quality, turnover or churn, or customer satisfaction, that would indicate an organization's health and sound positioning, and that were better indicators of likely future performance (Fig. 3).

It is very similar to the graphic above with the "customer capital" component replaced by "social capital." It is now assumed that customer capital is included in all of the above, the infrastructure extended to include the customer, the knowledge resources including the customer, and the social capital embracing the relationships not just within the organization, but with the customer (and the supplier to whom one is a customer) as well.

The concept of knowledge management continued to expand, most particularly by incorporating the notion of "the learning organization." Senge's^[20] *The Fifth Discipline, the Art and Practice of the Learning Organization* appeared in 1990 and had established something of a cult following, but had not made a major impact in the business world, but with KM it meshed perfectly. The thesis of the learning organization is that what ultimately creates and distinguishes a successful organization is its success in creating and sharing information and knowledge; in short, its success at learning. The obvious corollary is that to be successful, an organization must create a culture that fosters learning.^[21] One can say, in brief summary that the concept of the learning organization focuses on the creation of knowledge, while KM, as it was originally construed, focuses on the acquisition, structuring, retention, and dissemination of that knowledge. What then happened to KM is that the term was expanded to include the concept of the learning organization.

Similarly, a fit was quickly perceived with Nonaka and Takeuchi's^[22] work on tacit knowledge and how to

Fig. 3 Another version of the KM trinity.
Source: From Prusak.^[19]

discover and cultivate it (*The Knowledge-Creating Company: How Japanese Companies Create the Dynamics of Innovation*, New York, Oxford University Press, 1995). Nonaka's work was an obvious way to point out that KM was not just about explicit and structured knowledge, but also about how to retain, find, and share knowledge that was difficult to make explicit and that resided in people's heads, tacit knowledge. Nonaka's name became the token for that recognition. While the KM literature generally speaks of explicit and tacit knowledge, it is in fact more useful, as Keen and Tan^[23] point out, to think of three categories of knowledge, explicit, implicit, and tacit. Explicit knowledge is then that knowledge or information which has been captured in some explicit form, a procedures manual, or a database for example, implicit knowledge being that knowledge or information which has not been captured in some explicit form, but potentially could be, while tacit knowledge is that knowledge, like how to knead dough (the example Nonaka most famously used) or how to ride a bicycle, that cannot be fully captured in explicit form.

Both Senge's and Nonaka's work were not only about the human factors of KM implementation and use; they were also about knowledge creation as well as knowledge sharing and communication.

More recently,^[24] KM is described as a structure supported now by five columns, i.e., with five major constituents (Fig. 4).

Fig. 4 KM with yet more components.

We can reflect briefly for a moment on whether the Parthenon-like image of the structure is an unintended homage to KM as the latest temple to which the consultants lead the faithful.

Another way to look at the origin and development of KM is to view it as a series of stages.

STAGE 1

The initial stage of KM was driven primarily by IT, information technology. That first stage is well described with an equestrian metaphor as “by the Internet out of IC.” Organizations, particularly the large international consulting organizations, understood quite well that their stock in trade was information and knowledge, that often the left hand as it were had no idea what the right hand knew, and if they could share that knowledge—then they could avoid reinventing the wheel, underbid their competitors, and make more profit. When the Internet emerged, they realized that the intranet flavor of the Internet was an almost God given tool to accomplish that knowledge coordination and sharing. The first stage of KM was about how to deploy that new technology to accomplish those goals.

KM exploded in visibility in the business community because those large international consulting organizations, also realized quickly that many of their customers shared exactly the same problems, and that the expertise they were building for themselves could also be a product, an expertise, that they could purvey to those customers. A new product needs a name and a theme or rationale. The name for their new product was knowledge management, and the theme/rationale justifying it was *intellectual capital*, a theme which coincidentally had emerged as a hot topic in the business literature only a few years earlier, and which provided a wonderful rationale for the importance of KM. The first stage might be described as the “If only Texas Instruments knew what Texas Instruments knew.” stage, to revisit a much quoted aphorism.^[25] The hallmark phrase of Stage 1 was first “*best practices*,” to be replaced by the more politic “*lessons learned*.”

STAGE 2

The second stage of KM added recognition of the human and cultural dimensions. The second stage might be described as the “If you build it they will come is a

fallacy” stage. It was soon recognized that “If you build it they will come” is a recipe that can easily lead to quick and embarrassing failure if human factors are not sufficiently taken into account. As this recognition unfolded, two major themes from the business literature were brought into the KM fold. The first was Senge’s work on the learning organization, and the second was Nonaka and Takeuchi’s^[22] work on tacit knowledge and how to discover and cultivate it (both mentioned above). Both were not only about the human factors of KM implementation and use; they were also about knowledge creation as well as knowledge sharing and communication. The hallmark phrase of Stage 2 was “*communities of practice*.”

Much attention in Stage 2 focused on the World Bank. Under Wolfensohn’s administration the World Bank emphasized knowledge as their most important product, not the loans per se or the direct consequences of the projects supported, but rather the knowledge created by and shared from those projects.^[26,27] The centerpiece of their emphasis on KM was their very deliberate development of communities of practice (COPs) specifically designed to encompass experts external to the bank.^[28] At the same time, Denning’s^[29,30] work on storytelling as a technique to sell KM, focused on the intangibility of knowledge and the consequent frequent intangibility of KM results, and therefore the resulting need to justify KM by telling stories or anecdotes of results achieved, and then projecting “what if” consequences of further deployment of KM. Most of the storytelling examples centered on applications at the World Bank.

The Conference Board started organizing meetings on the subject of KM in 1997 (the first conference was entitled “Organizational Learning”). That first meeting was populated overwhelmingly by IT people. A good marker of the shift from the first to the second stage of KM, is that for the 1998 Conference Board conference (now called “Knowledge Management/Organizational Learning”), there was a noticeable contingent of attendees from HR, human resources, departments, and by 1999 HR was the largest single group. The year 1997 was also the first KMWorld conference, and can be seen as marking a certain coming of age of KM and its recognition as an important development to be paid attention to.

STAGE 3

The third stage is the awareness of the importance of content, and in particular an awareness of the importance of the retrievability and therefore of the importance of the arrangement, description, and structure of that content. Since a good alternate description for the second stage of KM is the “it’s no good if they don’t use it” stage, then in that vein, perhaps the best description for the third stage is the “it’s no good if they can’t find it” stage, or perhaps “it’s no good if they try to use it but can’t find it.”

If one peruses the content of the 1999, 2000, and 2001 KMWorld conferences, one can see the

emergence of Stage 3 clearly. At KMWorld 2000 a track on content management appeared for the first time and at KMWorld 2001 in October/November content management was the dominant track, constituting the largest cluster of topics in the conference. That third stage that emerged is well described as the *taxonomy/content* stage.

Another bellwether is that TFPL, a major UK consulting group, in a report of their October 2001 CKO (Chief Knowledge Officer) Summit reported that for the first time taxonomies emerged as a topic, and it emerged full blown as a major topic.^[31] The hallmark phrases emerging for the third stage are *content management* (or enterprise content management) and *taxonomies*.

STAGE 4

Starting roughly in 2003, a fourth stage of KM began to emerge. This stage is the awareness of the importance of information and knowledge external to the organization.

The inclusion of information and knowledge external to the organization is not new to KM, one need only think of the World Bank applications mentioned above. That being said however, the overwhelming emphasis of KM to date has been to mobilize and make accessible the organization’s information and knowledge. The most basic mantra of KM, is still the stage one mantra, “if only Texas Instruments knew what Texas Instruments knew”; the classic metaphoric example of what KM is all about, making *an organization’s* knowledge more useable and more productive.

The KM’s traditional emphasis upon just an organization’s internal knowledge can be best illustrated by quoting two of the most frequently quoted and used definitions of KM:

(Ponzi,^[32] attributed to Ruggles^[33]) Knowledge management is a newly emerging interdisciplinary business model dealing with all aspects of knowledge within the context of the firm, including knowledge creation, codification, sharing, learning, and innovation. Some aspects of this process are facilitated with information technologies, but knowledge management is to a greater degree, about organizational culture and practices.

(underlining added)

(Gartner Group^[34]—now Gartner Inc.) A discipline that promotes an integrated approach to identifying, capturing, evaluating, retrieving, and sharing all of an enterprise’s information assets. These assets may include databases, documents, policies, procedures, and previously uncaptured expertise and experience in individual workers.

(underlining added, Quoted in Malhotra^[35])

The mainstream KM mindset up until now of focusing only on the firm's or the organization's or the enterprise's information and knowledge assets could hardly be clearer. Note that while Ruggles is an individual author, and may be expressing a more particular view, the Gartner Group is a major high profile consulting firm, and their definition is in effect a description of the product, KM consulting, that they are offering, and in this their product description they are limiting KM to "an enterprise's information assets."

Several threads have converged to drive this emphasis upon including or providing access to external information:^[36]

- The extension of intranet-based KM systems to extranet-based systems. (Indeed a good name for Stage 4 might be the "Extranet stage of KM.") A logical extension of intranet-based KM is to build an "extranet" so that persons outside the organization, vendors, suppliers, dealers, major customers, etc. can be included. This has proceeded slowly however, as security, particularly for for-profit corporations is a major concern. It was precisely this lack of a need to be concerned about competitive information that allowed the World Bank to so quickly move into extranet-based COP. However as security techniques have improved, the willingness of corporations to extend COP onto extranets so as to incorporate the knowledge of "outsiders" has correspondingly increased.
- Concern about the knowledge about to be lost as post-war baby-boomers are beginning to hit retirement age. Corporations are beginning to realize that KM, in the form of retiree involvement in their COPs, is a powerful tool to address this issue.
- A repeat of the same broadening phenomenon that occurred with MIS, Management Information Systems, the realization that the information constituting the bulk of the information needed for managerial decisions lies near the top of the managerial decision making pyramid, and is typically external contextual information, not the organization's internal information. That same awareness is rapidly developing in the KM world, the

awareness that much of the key information needed for critical decisions lies outside the corporation or organization, and that the ideal KM system should provide appropriate links to the world outside the organization.

- *Globalization*: The increasing awareness that most organizations can no longer just think of themselves as a national company, and that they must compete globally or be overtaken by those who do, is now almost unquestioned received wisdom. The first corollary of this realization is that globalization requires knowledge about the external environment in spades. And furthermore, to avoid information overload, this external information should be gathered, organized, and made available in some coherent fashion.
- *Competitive intelligence*: Hard on the heels of the recognition of an increasingly global marketplace has come the awareness that you do not know where your competition will be coming from, and that to be adequately alert requires a conscious planned effort to acquire competitive intelligence on a global front, and that just attending the standard trade shows and chatting in the corridors will no longer suffice.

The result of these factors is a greatly increased emphasis upon external information. It should also be noted that another emphasis emerging simultaneously is that of the importance of situating information and knowledge in context. This is in fact another facet of the same evolution, the awareness that the importance, the usability, and the value of information is a function of how it relates to other information. New knowledge derives from the combination of information, either the juxtaposition of existing information, or the addition of new information to existing information.

SUMMARY OF THE FOUR STAGES OF KM

Stage 1: "by the Internet out of Intellectual Capital"

Information Technology
Intellectual Capital

Fig. 5 Bibliometric representation of business hot topics. The Lifecycle of Quality Circles, 1977–1986;^[37] Total Quality Management, 1990–2001;^[38] Business Process Reengineering, 1990–2001.^[38]

Source: From Abrahamson.^[37]

Fig. 6 Bibliometric representation of KM.

The Internet (including intranets, extranets, etc.)

Key phrases: “*best practices*,” later replaced by the more politic “*lessons learned*.”

Stage 2: Human and cultural dimensions, the HR, Human Relations, stage

Communities of Practice

Organizational Culture

The Learning Organization (Senge), and

Tacit Knowledge (Nonaka) incorporated into KM

Key phrase: “*communities of practice*.”

Stage 3: Content and retrievability

Structuring content and assigning descriptors (index terms)

Key phrases: *content management* and *taxonomies*.

Stage 4: The Extranet stage

External information

Key phrases: *globalization* and *competitive intelligence*.

Note that new stages do not replace earlier stages, they merely add an emphasis to aspects of KM that though there were inadequately recognized previously.

The KM clearly appears to be uniquely different from other business enthusiasms and fads, to use a blunt term, of the late twentieth century. Above are simple bibliometric graphs (the number of occurrence of the term per year in the titles of articles in the business literature) for “Quality Circles,” “Total Quality Management,” and “Business Process Re-engineering.”^[37] Notice how similar the pattern is (Fig. 5).

The profile of KM however is dramatically and fundamentally different (Fig. 6).

It is clear that KM is now in a pattern uniquely its own, first the typical 4- or 5-year burst of explosive growth, but since then a pattern of stable mature growth – not a pattern of boom and bust, but a pattern of boom and continuity.

Knowledge Organization System Standards

Stella G. Dextre Clarke

Information Consultant, Oxfordshire, U.K.

Abstract

This entry presents an overview of the standards for different types of knowledge organization system (KOS). Their development history and the principles within them are described. Standards for thesauri receive most attention, since other types of KOS are less standardized. The arrival of the Internet, enabling simultaneous access to multiple disparate systems and resources, caused a major reorientation of standardization efforts in the last decade, towards interoperability goals. Current initiatives address two main needs: interoperability between KOSs, and data exchange between one vocabulary application and another. The prospects for bringing the standards together are discussed.

INTRODUCTION

After considering the basic definitions of knowledge organization systems (KOSs) and standards, this entry is structured chronologically. First it deals with thesaurus standards in the twentieth century, then standards for other types of KOS in the same century, after which it moves on to developments in the twenty-first century. The principles embodied in the standards are described, and the reasons for a change of emphasis at the turn of the century. The prospects for bringing the differing standards together are briefly discussed, before conclusions are drawn.

WHAT IS A KNOWLEDGE ORGANIZATION SYSTEM?

Gail Hodge's explanation (p. 1)^[1] is widely quoted:

The term *knowledge organization systems* is intended to encompass all types of schemes for organizing information and promoting knowledge management. Knowledge organization systems include classification and categorization schemes that organize materials at a general level, subject headings that provide more detailed access, and authority files that control variant versions of key information such as geographic names and personal names. Knowledge organization systems also include highly structured vocabularies, such as thesauri, and less traditional schemes, such as semantic networks and ontologies. Because KOS are mechanisms for organizing information, they are at the heart of every library, museum, and archive.

To this it is worth adding that the most common reason for organizing information is so that you can find it again. Thus information retrieval is a key motivation for the design and application of KOSs, and a driver for most of the relevant standards.

In this entry, most attention will be given to thesauri, because for them we have well-developed standards with a good user base. The standardization scenario for classification schemes, subject heading schemes, and name authority lists will be discussed in less detail. Semantic networks and ontology standards will be mentioned only in passing, partly because they are dealt with elsewhere in this encyclopedia, and partly because they may have functions other than knowledge organization or information retrieval.

WHY STANDARDIZE?

According to BS 0, *A standard for standards* [12], Part 1 p. 4], a standard is a “document, established by consensus and approved by a recognized body, that provides, for common and repeated use, rules, guidelines, or characteristics for activities or their results, aimed at the achievement of the optimum degree of order in a given context.” Important benefits are said by the same source to be “improvement of the suitability of products (including services) and processes for their intended purposes, prevention of barriers to trade and facilitation of technological cooperation.”

But not everyone agrees on the need for standards. Ralph Waldo Emerson is usually credited with the famous line in support of innovation: “If a man write a better book, preach a better sermon, or make a better mousetrap than his neighbour, tho' he build his house in the woods, the world will make a beaten path to his door.” Thus progress in all fields requires that innovators continually enhance and differentiate their products, sometimes in contravention of the norms. On the other hand, conformity with standards often makes it easier for a new component to plug into an existing assembly, where it will be understood and accepted by existing users. This tension between

innovation and standardization can be seen throughout the history of KOS development, with no end in sight.

For KOS development and use, the potential advantages of standards compliance include

- Good practice guidance speeds up the development process.
- Off-the-shelf software may be available for building and maintaining KOSs.
- KOS-savvy users will understand the conventions used in format and display.
- Systems administrators and developers may find it easier to implement KOSs in applications such as search engines, cataloging, and content management systems.
- Searches across multiple systems, networks, and resources are much easier if the same indexing language applies to all of them.

The advantages of departing from the standards can include

- Opportunity to meet special user requirements in a particular domain.
- Opportunity to exploit a new technology that needs a different sort of vocabulary.
- Freedom to use existing vocabulary construction software that fails to comply with the standards.
- Untrained users may be more comfortable using a product that does not embody sophisticated conventions—even if performance is inferior.

Plainly there are pros and cons. This entry will show that in some respects the standards are widely taken up; in other respects diversity reigns.

THESAURUS STANDARDS IN THE TWENTIETH CENTURY

Prehistory

A standard rarely falls from a clear blue sky. The story usually starts with an exemplar of some new form of technology; then other specimens appear; then the need to standardize is perceived; then work begins to obtain consensus on the required features of future specimens. Sometimes one of the early exemplars is so widely received that it is adopted as an ad hoc standard. In all cases consensus is vital to ensure take-up of the eventual standard.

In the case of thesauri, original development was stimulated around the time of the Second World War by society's need (especially in the scientific and business arenas) to store and retrieve increasing volumes of documentary resources. While some researchers and

practitioners continued to pin their faith on classification, especially the emerging ideas for faceted classification, other pioneers were attempting term-based indexing approaches. Thus the systems of Uniterms and Zatocoding were developed by Mortimer Taube and Calvin Mooers respectively. N. Roberts^[3] provides an excellent account of their work, together with that of Luhn, Bernier, Crane, Whelan, Joyce, Needham, and others in the late 1940s and through most of the 1950s. All used the term “thesaurus,” but none had come up with a fully satisfactory working model.

The first fully operational thesaurus, according to Krooks and Lancaster^[4] as well as Roberts,^[3] was developed for the E. I. Du Pont Nemours and Co., Inc. in the United States. Stemming from this model a succession of vocabularies was developed in the ensuing decade, the most influential being the *Thesaurus of Engineering and Scientific Terms (TEST)*^[5] in 1967. According to Aitchison and Dextre Clarke^[6] *TEST* embodied most of the standard features visible in alphabetically organized thesauri for the next 30 years. Apart from the thesaurus itself, Appendix 1 of *TEST* gave a set of rules and conventions for thesauri that formed the basis of the first national and international standards, and are still traceable in today's versions of these. (For a synopsis of these, see “Principles embodied in the thesaurus standards” on page 4.) The rules have subsequently been augmented somewhat for techniques not used in *TEST*, such as facet analysis or classified displays.

Early Guidelines

But before the “official” standards were issued, several other sets of guidelines were published by bodies influential in the information management research community. According to Krooks and Lancaster,^[4] these included

- Committee on Scientific and Technical Information (COSATI) *Guidelines for the development of information retrieval thesauri* (1967).^[7]
- Educational Resources Information Center of the US Department of Education (ERIC) *Rules for thesaurus preparation* (1969).^[8]
- United Nations Educational, Scientific and Cultural Organization (UNESCO) *Guidelines for the establishment and development of monolingual scientific and technical thesauri for information retrieval* (1970, revised 1971).^[9]

Study of these guidelines suggests that the authors were often aware of each other's efforts. Commonly the examples used in one of them are borrowed in some of the others. (See Krooks and Lancaster^[4] for an analysis of the sharing of examples.)

Notably absent from all of them is any guidance for multilingual situations.

National and International Standards Emerge

In 1972, the German Standard 1463 was published, followed in 1974 by publication of both the international standard ISO 2788 *Documentation—Guidelines for the establishment and development of monolingual thesauri*^[10] and the American national standard ANSI Z39.19 *American National Standard Guidelines for thesaurus structure, construction and use*.^[11] All of these documents drew heavily on the already published guidelines and milestone thesauri described above. And all were broadly compatible with each other. ISO 2788 was then widely adopted as a national standard in countries such as Britain, Canada, France, Germany, and Spain. In some cases the national standard incorporated adaptations such as translation into the national language. For example the British Standard BS 5723 based on ISO 2788 and published in 1979 incorporated additional examples and procedures for dealing with compound terms (but when the 1985 editions of ISO 2788 and BS 5723 were published, they had become identical).

Interestingly, the 1974 edition of ISO 2788 acknowledged that a thesaurus could be defined either in terms of its structure or its function, as follows:

- In terms of function, a thesaurus is a terminological control device used in translating from the natural language of documents, indexers, or users into a more constrained “system language.”
- In terms of structure, a thesaurus is a controlled and dynamic vocabulary of semantically and generically related terms which covers a specific domain of knowledge.

Although these definitions have been revised in later editions, and the house rules of most standards bodies nowadays frown on such a dual definition, most thesaurus practitioners today would recognise the validity of the basic principles behind the words, and the importance of clarifying what a thesaurus is *for* as well as what is in it.

It was not until 1985 that ISO 5964 *Documentation—Guidelines for the establishment and development of multilingual thesauri*^[12] came out, the first standard to deal with cross-language issues. It followed the same principles and conventions as ISO 2788, but extended them and provided practical examples of how to deal with the complexities when exact matches between the scope of terms in different languages are hard to find. ISO 5964 too has been adopted as a national standard in several countries. BS 6723, for example, is identical to ISO 5964.

Sector Specific Standards

All of the national and international standards are of the “guide” type rather than the “specification” type. That is to say, they give broad and general information about a

subject, rather than setting out detailed requirements with procedures for checking conformity to the requirements. (See BS 0^[2] for more discussion of types of standards.) They are not backed by legislation that requires anyone to follow them in whole or in part. And they allow considerable room for discretion on the part of users, with no bar on optional extension. In practice, few published thesauri abide by the standards in every detail, and many have additional features compatible with the spirit of the standards. Sometimes one particular thesaurus enjoys such popularity in a given sector that its variant features become “standard” for all other thesauri in the same sector.

For example, the vocabulary *Medical Subject Headings (MeSH)*^[13] has become a classic in the medical field. The first edition was published in 1960, well before *TEST* had established the thesaurus rules and conventions. Nowadays *MeSH* is often considered to be a thesaurus, even though it began life as a subject headings scheme and departs significantly from the thesaurus standards. One of its key features is a set of “Tree structures” with an elaborate expressive notation which is not required by the standards. (For example, the concept of Meningitis is represented by the notation C10.228.228.507, and that of Bacterial meningitis by C10.228.228.507.280). Later in the 1960s and 1970s Elsevier built its own medical vocabulary *Master List of Medical Terms (MALIMET)* in a completely different style. Such was the popularity of *MeSH* and the pressure from users that when *MALIMET* was overhauled in 1988, one of the major enhancements was incorporation of a notation comparable to that of *MeSH*, and the vocabulary was renamed *EMTREE: The Life Science Thesaurus*.^[14]

Another trend-setter is the *Art & Architecture Thesaurus (AAT)*^[15] first published in 1990 on behalf of the Getty Art History Information Program. Its distinctive features include the rigorous application of facets, and the use of “guide terms” (rather than node labels as advocated by the standards) to structure the extensive hierarchies. The *AAT* has been hugely influential in its sector, adopted and adapted by countless museums and galleries around the world, where facets and guide terms are accepted as the norm.

Popular vocabularies like *MeSH* and the *AAT*, perhaps also the *Thesaurus of ERIC Descriptors*^[16] in the educational field and *Macrothesaurus*^[17] for industrial and economic development are often considered in their particular sectors as standards in their own right.

Successive Updates

ISO 2788-1974 was updated in 1986. Some of the changes were cosmetic, such as collecting up all the definitions, abbreviations, and other conventions previously scattered through the text, into separate clauses at the start. Original content (not foreseen in *TEST*) was added on how to

organize systematic displays, especially using facet analysis, and more examples of all kinds of displays were incorporated. Another significant substantive change was to adopt the rules for compound terms that first appeared in BS 5723:1979. Filling 32 pages rather than just 13, the 1986 edition^[18] is altogether more helpfully laid out and more definitive in its recommendations.

Z39.19 was updated twice in the last century—in 1980 and again in 1993. The foreword to the 1993 edition^[19] explicitly acknowledges that successive updates have built on the precursor guidelines mentioned above as well as the two editions of ISO 2788. This tendency towards convergence is reassuring for the user community of any of the standards.

Principles Embodied in the Thesaurus Standards

As explained above, the basic principles were set out in Appendix 1 of *TEST*. Over the decades they have been refined, augmented, and articulated in different ways, but the following essentials have survived:

- In a thesaurus, each concept is represented by a “preferred term” or “descriptor” (although optionally a language-independent code or notation may be used as the unique, unambiguous identifier of a concept). Each term may have only one meaning.
- Since in normal language several different terms may often be used to represent the same concept, each of these “non-preferred terms” or “nondescriptors” is provided as an entry point, guiding the user to the corresponding preferred term. A formal “equivalence relationship” is established between the preferred and non-preferred term.
- In a multilingual thesaurus, all the languages should have equal status and no language should be regarded as dominant. As ISO 5964 puts it in Clause 12.2, “every preferred term in one language should be matched by a corresponding term in the other language(s).”
- Since in normal language the same term may often take several different meanings, a means of disambiguation is necessary. A qualifier in parentheses should be added to the ambiguous term before it can be admitted as a preferred or non-preferred term. ISO 2788:1974 gives the example of thesaurus terms “beams (structural)” and “beams (electromagnetic)” to distinguish between two concepts that could be described by the same natural language term. The qualifier is treated as an integral part of the term.
- Where further clarification of the underlying concept is needed, a scope note may be provided. The scope note does not form part of the term. From ISO 2788:1974 a scope note example for “copper alloys” is “alloys in which copper is the principal constituent.”

- As well as the equivalence relationships mentioned above, a thesaurus should explicitly recognize hierarchical and associative relationships between concepts.
- The hierarchical relationship is often called broader/narrower, and most commonly applies when the two concepts are generically related, for example “dogs” are generically related to “mammals,” since every dog is a kind of mammal. The 1974 edition of ISO 2788 also admits some part-whole relations as hierarchical, for example between “botany” and “biology,” where botany is a part rather than a kind of biology. The 1986 edition further admits as hierarchical the instance relationship, for example between “Himalayas” and “Mountain regions.” (The Himalayas are neither a kind nor a part of a mountain region, but do represent an instance.)
- All of the standards show signs of difficulty in defining the associative relationship. Often it has a negative definition, as any relationship that does not qualify as hierarchical or equivalence. (For example, an associative relationship may be established between “teaching” and “training,” or between “transportation” and vehicles.) But underlying this fuzziness is a clear understanding that the function of this relationship is to guide users to terms that could usefully supplement or replace the one they first thought of. The subjectivity of this function causes difficulties in setting hard and fast rules. Successive editions of the standards provide increasingly copious examples, and further elucidation is provided in Milstead^[20] and Dextre Clarke.^[21]
- Thesaurus displays should follow well-established conventions for scope note and relationship tags, the most widely used ones in English being SN (Scope Note), USE (Use), UF (Use For or Used For), BT (Broader Term), NT (Narrower Term) and RT (Related Term). Use of these conventions results in entries of the following form:
 - Age discrimination
 - SN: Unfair treatment of people on the basis of their age, especially where it concerns older people.
 - UF: Ageism
 - BT: Discrimination
 - NT: Age discrimination at work
 - RT: Older people

French and German equivalent tags are established in ISO 5964.

Differences between the Standards

It is hard to find great differences in principle, apart from the enhancements at each update. Successive editions of Z39.19 have more pages and are organized differently from ISO 2788 and its variants. But the most noticeable substantive differences are:

- Z39.19 tends to be more prescriptive. For example, the 1993 edition gives rules for reciprocal scope notes, and for dealing with trademarks, neither of which are mentioned in ISO 2788.
- Unlike ISO 2788, Z39.19 has an index, a more elaborate table of contents, and a more extensive glossary.
- There are small differences in the definition and recommendations for handling compound terms.
- There is a difference of emphasis concerning the various forms of display recommended.
- Z39.19-1993 makes no mention of facet analysis or any form of classified display.
- Z39.19 has been updated more often.

Weaknesses in the Standards at the Turn of the Century

Inspired by the ground-breaking thesauri of the 1960s, the national and international standards were conceived in a print-oriented era and had barely adapted to exploit the opportunities of the electronic medium. Z39.19-1993 was the furthest ahead, incorporating a clause on computer-based thesaurus management systems. But all of them were written for a print-oriented audience and none of them had any advice on formats or protocols for data exchange. The only available standard applicable to data exchange formats was ISO 2709:1996 *Information and documentation. Format for information interchange*,^[22] based on the MARC format developed and maintained by the U.S. Library of Congress.

The MARC format was commonly used by libraries, as its principal application was for exchange of bibliographic records. But the module for “authority records” (i.e., for thesauri and other types of authority list)^[23] inherited features required for bibliographic data, making it cumbersome when applied to thesauri. MARC was (and still is) a sensible format to use when exchanging data with users of library management systems already adapted to the bibliographic format, but tends to impede exchanges with any other user community. Something else was needed for wider applicability.

A second form of weakness lay in the extent of implementation. Most respectable published thesauri in the 1990s claimed to follow one or other of the standards, but on close inspection most of them departed from the standards to some degree, for example in following the rules for compound terms. Comparison of almost any selection of published thesauri shows huge disparities in general layout and philosophy. In the 1990s, furthermore, a breed of vocabularies called “taxonomies” was emerging, a clear sign that the thesaurus model was proving either unsatisfactory or just not well enough understood for widespread adoption.

Plainly all of the national and international standards for thesauri needed to be overhauled.

STANDARDS FOR OTHER TYPES OF KOS IN THE TWENTIETH CENTURY

The reason is not entirely clear, but somehow the urge for national or international standards has barely extended to other types of KOS. Certainly there has been some standardization, but within the user communities of a particular KOS rather than across the boundaries. The situation with respect to ontologies is described in another entry of this encyclopedia, and the present discussion will be limited to classification schemes, subject heading schemes, and name authority lists.

Classification Schemes

The use of classification in organizing knowledge goes back to at least the third century BC, well before the establishment of the first national standards bodies. The *Dewey Decimal Classification (DDC)*, probably the most widely used classification scheme today, was first published in 1876. By the end of the last century it had seen 21 printed editions in English, plus 13 abridged editions, plus many translations into other languages, plus regular electronic updates; and we should not forget the countless local adaptations made by libraries with special collections. Within its community, the *DDC* is often seen as a standard in its own right, despite the coexistence and potential conflicts of so many versions.

The *Universal Decimal Classification (UDC)* and the *Library of Congress Classification (LCC)* too have august histories, with multiple versions in diverse libraries. Both are discussed elsewhere in this encyclopedia. Suffice it for present purposes to note that some members of the consortium that maintains and publishes the *UDC* are national standards bodies, and so the *UDC* has the status of a national standard in countries such as Spain and the United Kingdom.

And there is no way of counting the diversity of other classification schemes in use today, each with its own adaptations for particular subject areas, contexts, and user communities. There are usually very good reasons for differentiation. While in the past some dreamt of a scheme so universal that it could be applied to every library, that dream is now largely discredited.

If we accept that there will always be a need for different ways of organizing subjects, could we at least agree on the principles of classification, to which all the schemes would conform? Even here there are difficulties, stemming from the diverse origins of the different schemes. For example, the ideas of faceted classification expounded by S. R. Ranganathan and H. E. Bliss, further developed by the Classification Research Group and embodied in today's *Colon Classification* and the second edition of the *Bliss Classification*, are widely accepted as very sound and full of promise for electronic applications. The

maintenance agencies of the major schemes such as *DDC* and *UDC* have for years been adopting what they can of faceted principles into successive updates. But a practical problem stems from the huge volume of existing collections that have been indexed with earlier editions of the schemes. The user libraries face difficulties and much expense in switching to a new way of doing things, however superior in principle, because it becomes more cumbersome to retrieve items in their heritage collections. Hence much resistance to changes that are too sweeping, even when those changes bring convergence with other schemes.

Subject Heading Schemes

The scenario for subject heading schemes is dominated by the very widely used *Library of Congress Subject Headings (LCSH)*. Arguably *LCSH* is the standard, leaving nothing more to be said. However, few libraries use the whole of the *LCSH*; most add headings devised for their own audiences/collections; and not a few may be lax in applying the *LCSH* rules for combining headings in precoordinated strings. (For those unfamiliar with the different types of KOS, the provision of precoordinated strings is one of the key features distinguishing a subject heading scheme from the other types. Although in recent years *LCSH* has adopted some of the display conventions that apply to thesauri, its strength is still the provision of subject headings, whether uncoordinated or precoordinated.) In practice, diversity abounds. It is another illustration of the general observation that when a standard is not backed up by some legislation or monitoring authority, there is always a tendency to diverge in practice.

Name Authority Lists

Rather than national or international standards, again what we see are standardizing initiatives within particular communities. In some cases, such as the German National Library's *Personnamendatei (PND)*^[24] the approach has simply been to build an authority list with such a wide scope that it becomes a standard in its own right, without needing accreditation by an external standards body. In other cases guidelines have been drawn up to serve common needs when an organization is developing its own authority lists. These include

- IFLA *guidelines for authority records and references*,^[25] serving library associations worldwide.
- ICA/CDS *International Standard Archival Authority record for corporate bodies, persons, and families*,^[26] for archivists.
- *NCA rules for the construction of personal, place, and corporate names*,^[27] again for archivists but extending to place names as well as people and organizations.

All of them aim to combat the confusion that arises when one entity (a place, person, organization, etc.) is known by several different names. All support unique identification, usually by a single consistent name, and enable linkage of variant and alternative names to the appropriate entity.

THE TWENTY-FIRST CENTURY BRINGS CHANGE

The arrival of the desktop computer in the 1990s had exposed weaknesses in the standards, as well as opportunities for more effective exploitation of KOSs. The arrival of the Internet highlighted those opportunities and brought a step-change in the need for interoperability, both between one vocabulary and another, and between vocabularies and their applications. The scenario at the turn of the century was one in which new styles of vocabulary were bursting on the scene, new forms of technology inspired innovative applications, new user expectations were driving performance, and widespread budgetary restrictions imposed a new requirement for end-users to take on (or manage without) the tasks previously undertaken by trained intermediaries. Networking was the name of the game, driving the demand for interoperability.

Whereas the twentieth-century standards had addressed issues affecting the construction and use of any one KOS, interoperability was now needed to help us overcome the barriers between one KOS and another. A 2006 state-of-the-art review on *Terminology Services and Technology* from the Joint Information Systems Committee (JISC)^[28] highlights two key requirements for KOSs (see pp. 7 and 8, respectively):

- Mapping is a key requirement for semantic interoperability in heterogeneous environments.
- Interoperability requires commonly agreed standards and protocols.

The challenge and the opportunity was recognised, not only by the committees responsible for the existing KOS standards, but by some new players in the standards world, notably the World Wide Web Consortium (W3C). The ensuing initiatives will be described in these two groups:

Emerging standards for data exchange	Evolution of existing KOS standards
ADL Thesaurus Protocol	IFLA Guidelines for multilingual thesauri
Zthes	ANSI/NISO Z39.19-2005
SKOS (Simple Knowledge Organization Systems)	BS 8723
	ISO NP 25964

EMERGING STANDARDS FOR DATA EXCHANGE

ADL Thesaurus Protocol

The Alexandria Digital Library (ADL) was one of the first to take up the challenge of developing a protocol^[29] to support navigating and live querying of online thesauri. It is a lightweight protocol for accessing monolingual thesauri, especially those modeled on ANSI/NISO Z39.19. It is based on XML and the Hypertext Transport Protocol (HTTP), the basic transport mechanism for the World Wide Web. The protocol defines XML structures for describing the thesaurus as a whole as well as “brief” and “fuller” term formats. The brief format consists of preferred or non-preferred term. The fuller format comprises term; notes (with a specification of type); hierarchical (BT/NT), associative (RT), and equivalence (USE/UF) relationships. A list element provides a wrapper for a list of terms, and a hierarchy element a wrapper for presenting a hierarchy of terms. Wrapper elements also exist for all interactions and an error element allows for the reporting of errors to the client. The following stateless services are defined

- Getting general information about the thesaurus.
- Downloading a list of all terms.
- Searching the thesaurus using full term, keyword, or regular expression matching.
- Getting terms higher or lower than the current term in the hierarchy, to a specified number of levels.

These provide convenient methods for getting information for hierarchical displays or for extending searches to include all narrower terms. HTTP bindings for the abstract protocol are explained and examples given, facilitating implementation as a Web service.

Zthes

Zthes^[30] was originally developed as an application profile of Z39.50 *Application Service Definition and Protocol Specification*^[31] to enable exchange of thesaurus data. At its heart is a model which represents a thesaurus as a database of interlinked terms (in contrast with the SKOS model, which is based on concepts rather than on terms). Thus each individual term in a thesaurus, whether preferred or non-preferred, is represented by a record in the database. Term records consist of an initial part describing the term itself (with information such as its unique identifier, scope note, etc.), together with subrecords (that is, named sections within the main record) briefly describing related terms. The primary means of navigation from one term to another is by searching for the unique identifiers of the terms related to the first one.

The Zthes abstract model can be represented in XML. A single Zthes document in XML format consists of a

wrapper element plus a sequence of term elements, each of which represents a single thesaurus term composed of the elements described in the abstract model.

Additional specifications show how Zthes-compliant thesauri may be accessed using the Search and Retrieve by URL (SRU) protocol.^[32] This is a Web-based information retrieval protocol designed as a successor to the older protocol, Z39.50. It provides a simple means for expressing search requests, encoding them in URLs, sending them to servers and getting back results in a well-defined XML format.

The Zthes Profile for SRU provides the set of specifications prescribing the use of SRU to navigate remote thesauri. An SRU server conforming to this profile can expose its thesaurus to any conforming client, enabling its use in many applications.

Development of the Zthes model and specifications has been heavily reliant on inputs from interested organizations and individuals, without the backing of a standards authority. The outputs are freely available on the Web.

SKOS

Since this section was written, the 2005 Working Drafts of the SKOS Core Vocabulary Specification have been superseded by 2008 versions. More information is available at <http://www.w3.org/TR/skos-reference/>. The name SKOS^[33–36] refers to a program of work on developing specifications and standards to support KOS use within the framework of the Semantic Web. SKOS aims to work for a wide range of KOSs, such as thesauri, classification schemes, subject heading systems, and taxonomies. It does not deal with their construction, just with data sharing and exchange. As appropriate for the Semantic Web, the SKOS specifications are built upon the Resource Description Framework (RDF), which in turn is an application of XML.

Originally funded by the European Commission as part of its Semantic Web Advanced Development (SWAD) project in 2002–2004, SKOS is now backed by the Semantic Web Deployment Working Group of the W3C. As a standards organization with worldwide membership, W3C applies rigorous consultation and approval procedures, aiming to bring SKOS forward from a set of working drafts to the eventual status of W3C Recommendation. Unlike ISO and its family of national standards bodies, W3C makes its standards and other documentation freely available over the Web.

SKOS is designed as a modular and extensible family of languages. The main components are as follows:

- *SKOS Core* is the basic specification of a common data model for sharing and linking KOS. In contrast with Zthes, it is based on a concept-centric view of the vocabulary, where primitive objects are not terms, but abstract concepts represented by terms. Development work was substantially influenced by BS 8723-2,

resulting in a good level of compatibility between the underlying models for both of these. The first Public Working Draft of SKOS Reference^[35] was published on January 25, 2008. It is accompanied by several guidance documents, lists of use cases, etc.

- *SKOS Mapping* will address interoperability by providing a vocabulary to express matching of concepts from one concept scheme to another. This part of SKOS was developed in the SWAD-Europe project and has not yet been adopted by W3C, but is maintained informally by SKOS editors.
- *SKOS Extensions* is intended to provide for features of KOSs beyond the most basic ones. For example it will support subclasses of the thesaurus hierarchical relationship (commonly known as BT/NT) such as generic, partitive, and instancial (commonly known as BTG/NTG, BTP/NTP, BTI/NTI, respectively). Like SKOS Mapping, active development of this part awaits completion of SKOS Core as a W3C Recommendation.
- *SKOS API* is a Web Service Application Programming Interface (API), designed to provide access to thesauri and other simple KOSs via the Web.^[36] It defines a core set of operations for programmatically accessing and querying a thesaurus. While intended for Web service calls, the API itself remains independent of such concrete implementation details. It could also be capable of adaptation to formats other than SKOS Core.

A recurring question in discussions on SKOS development work is the depth to which SKOS should attempt to model the different vocabulary types. If the modeling is relatively superficial, it is easier to accommodate a wide range of KOS types and hence allow easy data exchange within a wide community. If the modeling goes deeper and imposes semantic constraints on encoded data, it will enable more powerful reasoning about the type of information indexed with or retrieved by the KOS. At present the weight of opinion seems to favor the former approach, in order to keep things as simple as possible.

EVOLUTION OF EXISTING KOS STANDARDS

IFLA Guidelines for Multilingual Thesauri

Although the International Federation of Library Associations (IFLA) had never published its own thesaurus standard, it has taken a long-standing interest in the international standards. In 2002 it set up a working group to update and enhance the content of ISO 5964. A draft report^[37] was circulated for comment in April 2005, carrying a large number of up-to-date multilingual examples to supplement the existing ones. Largely the draft builds

on the long-established principles of ISO 2788 and ISO 5964, but one radical departure is to define a “nonsymmetrical thesaurus” as a “multilingual thesaurus in which the number of descriptors in each language is not necessarily the same and also the way descriptors are related to each other can be different for the different languages.” This contrasts with the approach of BS 8723-4, which considers such a situation as a case of mapping between two or more different thesauri.

The target date for publication of the final version of the guidelines is 2009. There is every prospect the outcome will feed into the development process for ISO 25964.

ANSI/NISO Z39.19-2005

In November 1999 National Information Standards Organization (NISO) organized a workshop to investigate “the desirability and feasibility of developing a standard for electronic thesauri.” Among its conclusions were that a new standard “should provide for a broader group of controlled vocabularies than those that fit the standard definition of ‘thesaurus’,” and that, “the primary concern is with shareability (interoperability), rather than with construction or display.” (See full report at http://www.niso.org/news/events_workshops/thes99rprt.html).

Following the meeting an advisory group was assembled and the eventual outcome was publication of the 2005 edition of Z39.19, *Guidelines for the construction, format, and management of monolingual controlled vocabularies*.^[38] The change of title reflects its extension to cover lists (such as drop-down lists), synonym rings, and taxonomies, as well as thesauri. Some other significant changes were:

- Make the text clearer for untrained users, giving the reasons behind the rules and more explanation of the basic principles of vocabulary control.
- Include display formats for electronic as well as print media.
- Cater for browsing and navigation applications as well as keyword searching.
- Consider Web applications as well as the traditional ones.

Despite the original aspiration to address interoperability concerns, however, the revised standard stops short of embarking on cross-database search issues, multilingual situations, or data exchange formats and protocols.

BS 8723: Structured Vocabularies for Information Retrieval

The international standards ISO 2788 and ISO 5964 (which are identical to BS 5723 and BS 6723) came up for their quinquennial review in 2000. Members of the BSI

committee took the view that revision was long overdue. Rather than attempt to establish an international working group, they opted to work first on the British Standards, which would later be offered up to the international community. And so work began on BS 8723, requiring a complete overhaul of the monolingual and multilingual standards, bringing them together and addressing the interoperability needs discussed above.

Over the next 7 years, the standard was published progressively in five parts as follows:^[38–43]

- BS 8723: Structured vocabularies for information retrieval—Guide
- Part 1: Definitions, symbols, and abbreviations (2005)
- Part 2: Thesauri (2005)
- Part 3: Vocabularies other than thesauri (2007)
- Part 4: Interoperability between vocabularies (2007)
- Part 5: Exchange formats and protocols for interoperability (2008)

Part 2 is effectively an update of ISO 2788 and BS 5723, covering monolingual thesauri and adding:

- Clearer guidance on applying facet analysis to thesauri.
- Some changes to the perennially challenging rules for compound terms.
- More guidance on managing thesaurus development and maintenance.
- A functional specification for software to manage thesauri.
- A general expectation that people will use the thesaurus electronically, as well as in print.

Apart from the rules for compound terms, the principles in the earlier standards remain intact, only they have been reexpressed to apply more intelligibly in the electronic era.

Part 3 covers completely new ground, for the following vocabulary types:

- Classification schemes
- Business classification schemes for records management
- Taxonomies
- Subject heading schemes
- Ontologies
- Authority lists

None of these is covered in the same depth as thesauri. The standard does not, for example, explain how to build a new classification scheme. With interoperability needs in mind, the thrust was to compare and contrast the essential elements of each of these vocabulary types. The aim was to provide enough description of these types of tool so that an information technology developer would be able to implement them interoperably with other vocabularies. An exception was made for the clause on taxonomies, which does also incorporate guidance on general good

practice, particularly on the issues around designing and using taxonomies for Web browsing and navigation.

Part 4 deals with mapping between vocabularies. It addresses the common scenario enabled by today's networks, where a query expressed in one vocabulary needs to be applied to multiple resources indexed with a variety of different vocabularies. By treating a multilingual thesaurus as a special case of mapping between vocabularies, it effectively updates ISO 5964 and BS 6723 as well as extending their scope considerably.

Part 5 establishes a data model for monolingual and multilingual thesauri, and also a format based on XML for exchanging data. The model and format provide for all the thesaural features described in Parts 2 and 4—not just the commonly used features but also sophistications such as classified arrangements with facet names and characteristics conveyed in node labels. So much original work had to be done on the model and schema that the final document has number DD 8723-5 and its status is Draft for Development. In line with good practice for XML, a namespace has been established for the XML schema at <http://www.bsigroup.com/resources/standards/bs8723/>. A development Web site at <http://schemas.bs8723.org/> shows examples of encoding as well as providing a discussion forum to encourage user testing and feedback, and transformations between alternative formats.

ISO 25964

Following publication of BS 8723, a project named ISO NP 25964 has been established to adopt it as an International Standard.^[44] The standards bodies of 11 member countries, including the United States, are participating in the work. The target date for completion is late 2010. There is every hope that the eventual standard, ISO 25964, will complete the development work begun in BS 8723, integrate inputs from the IFLA Guidelines, and generally bring the whole international community together.

PROSPECTS FOR RESOLVING THE DIFFERENCES BETWEEN STANDARDS

The differences between ISO 2788, ISO 5964, BS 8723, and the forthcoming ISO 25964 are irrelevant for this discussion, since the underlying set of principles is constant. The documents are simply evolving in step with the context in which they are applied. Backwards compatibility is rarely a problem. Comparing this family with ANSI/NISO Z39.19, the main differences are in scope and presentation. Each of them covers some aspects that the other does not, and the content is organized in different ways. Any differences of principle are quite hard to spot. The recommendations for applying facet analysis do differ, and to a lesser degree those for compound terms. In general, however, the areas of conflict are minor and there seems

no harm in the coexistence of these standards. Perhaps there is even some benefit, as coexistence allows working groups in different geographical zones to learn from each other and build stepwise on each other's shoulders.

More serious are the differences between the data exchange formats expressed in MARC, Zthes, SKOS, and DD 8723-5. In theory there could be big interoperability gains if everyone would use the same format. But in practice this is very hard to achieve, since each of these corresponds to a different context and set of needs. The future probably lies in developing transformations between these formats, so that a vocabulary expressed in one of them can readily be converted to another.

The biggest challenge of all lies in the coexistence of a huge variety of individual KOSs and types of KOS. Some of these have been around for a very long time, without need of accreditation by any standardizing body, and have large user constituencies. There seems little prospect of bringing them all together under one set of principles and practices. The best hope of overcoming the barriers seems to lie with mapping.

CONCLUSIONS

- At the level of national and international standards bodies, thesauri have attracted more sustained attention than any other form of KOS.
- Several different national and international standards for thesauri coexist, without causing significant compatibility problems.
- For classification schemes, most standards work has been within the user communities of particular schemes, the major challenge being to accommodate successive updates without impeding retrieval of data classified using earlier versions.
- While thesaurus standards in the twentieth century have done much to encourage common approaches to construction, they have not addressed the major semantic interoperability problem inherent in the proliferation of hundreds (perhaps thousands) of different individual KOSs.
- Arrival of the Internet and other networks has highlighted the need for interoperability, both at the semantic level and at the data exchange level. To address these needs, the main approaches now being explored are mapping, for semantic interoperability, and standard formats and protocols for data exchange.
- Initiatives such as SKOS, Zthes, and ADL are now yielding a range of standard formats and protocols.
- The recently published British Standard BS 8723 addresses both the mapping challenge and the exchange format needs, but would benefit from more development work.
- The international project ISO NP 25964 offers the opportunity for participants from the major national standards bodies in 11 countries to take the BS 8723

work forward and integrate contributions in an enhanced international standard for KOS construction, management, and interoperability.

Knowledge: Tacit and Explicit

Philippe Baumard

School of Engineering, Stanford University, Stanford, California, U.S.A., and University Paul Cézanne, Aix-en-Provence, France

Abstract

This entry explores the differences between tacit and explicit knowledge. Tacit knowledge is defined as a form of knowing that cannot be expressed. Organizational theory has been particularly concerned with tacit knowledge as a part of an effort to identify and utilize the unique knowledge that is distinctive to successful organizations.

The distinction between tacit and explicit knowledge was popularized by the works of Polanyi^[1] on personal knowledge. Tacit knowledge is the knowledge that cannot be expressed; it is unknown to the knower, however actionable, either through automatisms (for swimming, in Polanyi's examples), or more or less deliberately. As codification is achieved by means of abstraction, tacit knowledge is usually opposed to explicit knowledge for being "not codified" or "escaping representation." Categorizing knowledge and the act of knowing into different forms is a practice as old as civilizations. The act itself, of declaring that there is a "knowledge" that is *not* embodied in the traits of a ruler, is *not* coming from a god or a mystical source, is an act of culturally forming a civilization. Archaic societies associated knowledge with either a gift of their gods, an unexplainable trait of a mystic ruler (sorcerer, priests, and the like), and in shamanic societies, knowledge was considered an independent realm, access to which was synonymous with loss of consciousness and abusive use of drugs.

As many rational myths accompanied mystical explanation(s) of the existence of knowledge in archaic societies, they also accompanied the formation of the role of knowledge in civilization. As we will see in this entry, the Greeks, circa 220 B.C., came up with extraordinary labels to differentiate between the practicality of the swordsman's know-how, which they labeled *métis*, and the wisdom of the city ruler, which they labeled *phronesis*. Were they trying to please both? Is it just that each stage of civilization is bringing its new categories of knowing, to please rulers, priests, artisans, slaves, and workers? Is engineering merely an adaptation of the Greek concept of *techné*? Or is there a real science in the art of knowing?

In the first section, we will investigate whether there is strong evidence in support of knowledge transformation. If tacit and explicit knowledge forms are anything else than a mere "social categorizing," then "implicit learning" must be supported by scientific evidence. In the second section, we investigate known knowledge transformation,

between the tacit and the explicit, the individual and the collective. Building on propositions by Nonaka,^[2] we propose an integrative framework showing the different forms that knowledge can pass through when being applied, used, and mobilized. In the two last sections of this entry, we end up questioning if knowledge can, *by any means*, be represented? Therefore, we suggest that as knowledge escapes representation, the production of an actionable model of knowledge transformation shows little evidence, and abundant mythology. This mythological questioning concludes our investigation, as we question knowledge as a mere artifact of behavior, or truly essential to survival; and if, ultimately, knowing—tacitly or explicitly—can be separated from being by means other than abstraction or social categorization.

WHEN GREEK PHILOSOPHERS WANTED TO GET RID OF THE ORACLES...

Many societies made distinctions between what is known and can be transcribed, and what is believed to be known, but impossible to transcribe, express, or qualify. In archaic societies, what was impossible to express or explain was usually considered an act of gods, oracles, or mystical artifacts. Ancient Greek scribes and philosophers were the first to elaborate a non-religious pragmatic distinction between the tacit and the explicit by opposing the hard-to-imitate practical knowledge of the astute fisherman or the cunning of the hunter with knowledge captured and stored in scriptures. Detienne and Vernant, in their 1974 study of cunning intelligence, identified four generic categories used in ancient Greece: the *phronesis*, a form of unarticulated social wisdom learned through experience, which we would call "tacit knowledge" today; the *techné*, the codified or non-codified procedural knowledge of craftsmen; the *episteme*, the art of abstraction and generalization, which corresponds to contemporary collective and explicit

knowledge; and finally, the *Métis*, the non-codified knowledge of short-cuts, cunning, and oblique strategies.

Episteme can be defined as universal knowledge that we share and circulate, that we teach and preserve, and that is commonly understood by firms as their “culture,” recipes, rules of thumb, know-how, etc. *Episteme* is knowledge *about* things, the opposite of *phronesis*, which is the result of experience and social practice. *Phronesis* is singular, idiosyncratic, and assumed to be difficult to share. It is personal, and has profound meaning only for the individual who has lived the experience. This non-scientific, practical, contextual knowledge is generated in the intimacy of lived experience. It is acquired by trial and error, through organizational and environmental learning, and is generally very difficult to analyze or test. Its intuitive content renders it difficult for organizational science to grasp.

Greek society had an in-depth understanding of the precise societal roles that could be played by the three above forms of tacit knowledge: *phronesis* was built through councils, management of the cities, estates, and large organizations; experience and seniority was used to select organizational members who accumulated this form of social implicit learning over time. *Techne* was the tacit knowledge, the know-how, of the workforce, the builders, and the artisans. *Métis* was the know-how of the warriors, fishermen, and military commanders.

Little is known about the motivations of Socrates, Heraclitus, and contemporary philosophers and scribes in introducing such distinctions. Detienne and Vernant^[3] see in this categorization the reflection of a Greek society that liked to ordinate and rule all matters of status, prerogatives, and social claims. Another hypothesis might well be that Greek philosophers, by making explicit the different categories of knowledge, and above all, knowing, might have fought the over-arching authorities of oracles and rulers. Stating that knowledge can be accessed by its simple production, by means of abstraction, social wisdom, or basic cunning, is not it already asserting that the way of oracles lacks of adequate grounding?

Information technologies could well be the modern “oracles” that trigger, twenty centuries later, a re-flourishing of studies of tacit knowledge. The rise of electronic data interchange, and its rapid globalization, generated optimistic expectations of a new era of a globally codified knowledge, moving assets, endless combinations of technological systems. Of course, the ease of knowledge codification with information systems has been since challenged. This codification of industry, craftsmanship, medical, or managerial practice has become the source of growth of the new capitalism. However, if knowledge is being codified in larger quantities on larger scales, most human learning remains implicit, hard to codify, to replicate or to digitalize.^[4]

IN THE PURSUIT OF EVIDENCE OF KNOWLEDGE TRANSFORMATION

Implicit learning means learning without being aware of what is being learned.^[5] Linguists carried out the first studies concerning the unconscious acquisition of complex information at the end of the 1960s. Other works in the field of perceptual learning have highlighted the existence of implicit rules and patterns of individual perception, of which people have no awareness. In other words, complex information is acquired with little awareness of the context in which it happens. Human learning can proceed with rare, infrequent, discrepant stimuli, and still deliver forms of valid learning from imperfect, scarce, and unstable knowledge. This characteristic of human learning was expressed 2000 years ago by the Latin proverb “*Intelligenti Pauca*”—intelligence (here the capacity to make sense of things and to learn) proceeds from the slightest of things.

The implicit nature of human learning is also ambiguously temporal. Most human sense-making is retrospective, i.e., people access and formalize perceptions after they have occurred; yet, it is impossible for a human being to determine which part of his or her learning was anterior or posterior to a single given event. In other words, learning is more analogically related to biological growth, than to systems, processes, and machines. As one cannot see the lawn grow, one cannot contemplate his or her own knowledge “growing.” Accordingly, although they have consistently tried over several decades, both social and engineering sciences have been unable to establish any form of correlation between information and knowledge. The amount of information possessed by an individual is not a predictor of the validity, range, and depth of the knowledge that this individual will be able to produce. Reversibly, the amount of knowledge, wisdom, social experience that is possessed by an individual does not constitute a predictor of the quantity of valid information this individual will produce. There is, simply said, no correlation between information and knowledge. A little information can produce a very valuable knowledge. Large quantities of codified, refined, dispatched information can produce very poor knowledge. Hence, there are neither pyramids nor hierarchies between data, information, and knowledge. Several pieces of data put together *do not* systematically produce information. Interpreted information, senses attributed to information, and data do not systematically produce a chunk of knowledge.

This hierarchy between data, information, and knowledge is a powerful post-modern myth. Modernity was about advancing positive science in the service of general welfare, and human, social and technological progress. The core belief that a society could unilaterally advance its societal knowledge also belongs to the myth that societal progress is cumulative, predictable, and can be attained through layers or steps. Human, societal, and

technological progressions are neither linear, nor fairly balanced on a positive scale along history timelines. Some ancient societies, for example pre-Socratic Greece or Qin China in 220 B.C., were more advanced and learned than many societies that followed them. As post-modern societies have become more and more dependent upon the processing of very large amounts of information, the belief that data and information are scalable into proportional advances in knowledge has become the new social contract, the veracity of which being rarely questioned.

Definitions of knowledge and information have followed different paths, until they collided in management studies. For Polanyi,^[1] knowledge is an activity that he describes as the process of knowing. For Wiener,^[6] information is a structure that precedes the activity of knowing, while Shannon^[7] saw information as the original disorder from which knowledge is generated by discovering or crafting messages from the articulation of chaotic information. Wiener's perspective led to distinguishing information from rules, reasoning, and treatments that can be applied to it, and was the foundation stone of cybernetics.

KNOWING IS EXPERIENTIAL

One factor that could support the lack of correlation between information and knowledge lies in the fact that most human cognition is experiential; either we look forward, or we look backward. As Gavetti and Levinthal (p. 113)^[8] put it, "cognition is a forward-looking form of intelligence that is premised on an actor's beliefs about the linkage between the choice of actions and the subsequent impact of those actions on outcome." Foreknowledge of potential outcomes develop with experience, not related with age, but more so related to similarities in patterns and design of the complexity of the situation being apprehended.^[9,10] People naturally rate the outcomes of their predictions according to their results, either positively or negatively. This experiential wisdom generates itself "rules of thumb" and experiential memory that can be contrary to rational models or individual mental models.^[11]

For Polanyi,^[1] most of this experiential knowledge is unknown to the beholder. Polanyi differentiates knowledge that is explicit to us, that which is modifiable and transmittable in a formal and systematic language, from tacit knowledge, which is personal, difficult to convey, and which does not easily express itself in the formality of language. Polanyi's principal argument is that tacit knowledge demonstrates the lack of pertinence of Gestalt psychology. Whereas Gestalt psychology argues that all images are contained in nature, Polanyi wants to demonstrate that human beings acquire knowledge through their engagement in the creation and organization of their own experiences. Thus, by distinguishing knowledge that is

acquired and developed through behavior, and knowledge that is acquired, stored, and transformed through cognition, Polanyi opened a vivid debate, opposing the behaviorist and cognitive perspectives on knowing.

Founded in Kantian psychology,^[12] the cognitive dimension of tacit knowledge refers to patterns that serve as a basis for the perception of, and interaction with, the external world. Thus, it is only on a selective basis that we accept information to which we are exposed, staying faithful to our own pre-established cognitive patterns. This phenomenon is known as "perceptual filtering."^[13] This approach has been exhausted by managerial studies of knowledge in the workplace, noticeably by Nonaka^[2] who introduced a dynamic perspective on knowledge creation, based on its explicit vs. tacit, collective vs. individual dimensions.

EXPLICIT AND COLLECTIVE KNOWLEDGE

Explicit and collective knowledge is all the knowledge a community can tell it knows. Several authors use the term "objectified knowledge" to suggest that this knowledge is considered as objective by the community that shares it. In a positivist understanding, science is a collective and explicit knowledge, though this conception has been challenged by Kuhn, in the *Structure of Scientific Revolutions* or by Feyerabend^[14] in *Against Method*. For these authors, scientific knowledge is embedded in "paradigms" that are constituted by both scientific discoveries that are commonly acknowledged as valid, and beliefs on the state of the paradigm. Thus, for these authors, scientific researchers should challenge (scientific revolutions) existing paradigms in order to help science progress.

In the organizational body of knowledge, patents, corporate written rules and procedures, organizational charts, and management decisions that are produced, acquired or applied by an organization are all part of the explicit and collective body of knowledge. Patents, for example, are the articulation, embedded in written format, of the technical know-how of the firm. The purpose of making knowledge explicit and collective can be to disseminate this knowledge to others, to inform people about recent management decisions, to implement new programs and procedures within the organization, or to signal to the "external environment" the organizational purpose and positions, i.e., prices signal to the competitors and partners of the organization the market value of the services or products offered by the organization. All explicit and collective knowledge is not systematically explicit or collective in the first place. Rules that are informal and ephemera can become permanent and explicit through institutionalization.^[15] Organizational ceremonies^[16] can also become explicit rituals, and progressively stand for permanent rules.

EXPLICIT AND INDIVIDUAL KNOWLEDGE

We can approach individual and explicit knowledge from two perspectives: the sociological and the technological. From an elementary sociological view, we would say that everything that becomes conscious to us becomes part of our individual explicit knowledge, i.e., we discover that we belong to a certain group of people in the organization, as commercial middle managers for example. As soon as we become aware of this belonging, we acknowledge explicitly in our behavior what has become a “fact.” Spender^[17] uses the term “conscious knowledge” to express this type of knowledge.

The other side of individual and explicit knowledge is what we will call our known-expertise, not to betray precedent findings on expertise that clearly state that the essence of expertise lies in the tacit understanding of rules that are unknown to the beginner or non-expert. The example of the chess masters used by De Groot^[18] or Newell and Simon^[19] clearly illustrate this point. However, some types of expertise have solely an explicit purpose. The diploma and the titles of doctors have the purpose of communicating the reliability of his or her services. It may as well have the purpose of stating a social and power position, as unveiled by Foucault^[20] in his study of the “statutory knowledge” of doctors in the history of medicine. This type of explicit and individual knowledge, with the purpose of “declaring,” has been termed “declarative knowledge” by Polanyi.^[11] Positioning and social role-play consequently form a major part in the transformation and exposure of individual and explicit knowledge.

TACIT AND COLLECTIVE KNOWLEDGE

Managers elaborate informal task forces that work on critical issues in parallel to—not instead of—formal structures. These “collateral organizations”^[21] often crystallize in the course of action. People gather to deal with a specific problem, and naturally gather again when a similar problem arises. “Web of complicities” allows organizations to deal obliquely with delicate tasks when formal and explicit processes seem to fail. In the *Challenger* disaster, NASA engineers progressively assimilated the Thiokol rubber joints defaults as acceptable. Although measures were explicitly showing unreliable performances, it became tacitly accepted that this imperfection was within the boundaries of “normal” and “acceptable” risks.^[13] Studies in organizational crises and disasters underline the socially constructed nature of knowledge.^[4] Knowledge, in this perspective, is the result of various social constructions,^[22] and consequently adopting different forms and states according to its different points of observation. For Berger and Luckmann, individuals are

born in a “social construction,” from which we learned to assimilate, to articulate the stimuli around us to formulate our language. Likewise, Lave and Wenger^[23] assert that people in organizations belong to “communities of practice” where they share a practical knowledge, learning collectively and tacitly their trade.

Many trades are thus learned tacitly and collectively. Masonry apprenticeship is a learning-by-doing and by-seeing-others-doing-it process. The tacit and collective know-how of cathedral builders has become legendary. As cathedrals were sometimes built over three or four centuries, generations of cathedral builders—many of whom were illiterate—transmitted from fathers to sons a know-how of achieving complex tasks, without the knowledge or reading and writing. Commitment and faith in supra-ordinal goals were part of the process. Tacit and collective knowledge can also be a guarantee of organizational operational safety. The “collective mind” of flight deck operators^[24] permits highly complex organizational tasks to be achieved with very few accidents. This “organizational mentality” or “organization mind”^[25] relies upon a tacit understanding that do not necessitate explication. Thus, technical knowledge is often acquired through repetitive tasks, the know-how of which is difficult to communicate. Scribner^[26] explains how tacit knowledge is held collectively by workers in a commercial dairy (warehouse order packers, delivery drivers, inventory takers). This tacit and collective know-how is difficult to imitate, and can procure valuable technological rents, allowing the firm to develop an “appropriability regime.” Many times we say “we know” to express assumptions that seem to be common sense, while in fact we only express the output of a tacit and collective learning^[27] or things we have learned by traditions whose origins have been forgotten.^[28] Many elements of our knowledge are gathered without awareness from others while we socialize.^[2,29] We assimilate assumptions that are not ours, and personalize or rationalize them, so to give them our “signature.” Then, we would eventually say, “It’s common knowledge” or “it’s common sense.”^[17]

TACIT AND INDIVIDUAL KNOWLEDGE

As Polanyi^[30] put it, “We know more that we can tell.” First, there are many stimuli that we notice without being aware of noticing them. We learn without the awareness of what is being learned.^[31] We cannot communicate what we learn, thus, we are the only one to be the receiver of this “knowledge.” Second, we do not always learn systematically or intentionally. There are many things that we have learned “incidentally,”^[32] because we had the luck to encounter an unexpected learning experience, or because we were focusing on another task, and something else was to be learned in this task that we did not expect. In the routine of repetitive tasks, we may also acquire a

Fig. 1 Transitions from tacit to explicit and vice versa.

tacit knowledge concerning the improvement of our task. This "procedural knowledge"^[26] is difficult to share, and when somebody replaces us at our task, the know-how is difficult to transmit. As termed by Spender,^[17] a large part of our knowledge is "automatic knowledge." We do not know where it comes from, we cannot tell that we know, though "it's here" and "it works." We encode without awareness of encoding.^[33] We act mindlessly and instinctively, relying on an "animal knowledge" made of erratic reactions, or impulsive, based on feelings, smells, guts, like animals do.^[34] We often rely on a "practical knowledge,"^[28] which we are not able to isolate, define, or describe, for we acquired it through mindless and automatic practice. Some elements of our knowledge were constructed unconsciously, by serendipity, that is to say by luck, by imagining a body of knowledge that does not rely upon the noticing of stimuli, but is solely the work of our mind. All this heterogeneous, and rather mysterious, body of knowledge is our "tacit and individual knowledge."

ARTICULATING THE TACIT WITH THE EXPLICIT

It would be misleading to state that the four above types of knowledge are independent of each other, and constitute separate and idiosyncratic bodies of knowledge. The dynamics of knowledge is a continuous, either deliberate or unconscious, movement, exchange, transformation of

one type of knowledge into another, and back and forth. To express the speed of these transformations and shifts, a suggestive analogy would certainly be close to the notion of electrical frequencies. We have, unfortunately, no clues to know if, in the human brain, these four types of knowledge are processed in parallel or sequentially. Researching the epistemological and ontological dimensions of knowledge, Nonaka^[2] synthesized the four kinds of transitions between explicit and tacit dimensions of knowledge (Fig. 1). As Nonaka compiled it from different authors (Piaget, Teece, etc.), a specific mode of transition exists for each transformation. For example, tacit knowledge circulates through socialization, i.e., we learn tacit behaviors and rules, by interacting and observing other people. This tacit knowledge (i.e., the baker's know-how in preparing bread) can be articulated in more explicit rules (i.e., by using different sets of measure in all various conditions of the process to identify rules that are used tacitly by the baker) and then become explicit knowledge. This explicit knowledge can then be combined with other elements of explicit knowledge. For example, two software programs can be merged. The new set of instructions is a combination of formerly separated sets of instructions included in the software. When we face an explicit set of knowledge, we have then to integrate it into our behavior and practice. We achieved this task through practice of the explicit rules, techniques, scientific findings, etc. We internalized our tacit knowledge and made it ours, transforming it into the elements of explicit knowledge.

Using various precedent findings,^[1,17,30] we developed the precedent matrix by integrating the individual and collective dimensions. We finally identified eight forms of transitions in an integrative framework to analyze the different shifts between knowledge types (see Fig. 2). We use these eight forms of transitions as to identify, describe, and explain when and how they occur in the studied organizations. For example, we would identify an "appropriability regime" between the knowledge of engineers—planning and executing the construction of the Guinean plant—and newcomers to the plant. In another example, managers would gather various uncertain or ambiguous stimuli and build a tacit understanding

Fig. 2 An integrative framework to analyze transitions of knowledge types.

of the situation. They would share this understanding by socialization (tacit and collective knowledge) and would learn implicitly to organize this knowledge. Finally, by meeting together and “putting things on the table,” they would articulate all their tacit knowledge in one explicit and collective form of knowledge. The elaboration of the following matrix involved extensive reviews of the literature, as to confirm by different sources the validity of each transition. The terms “extension,” “appropriation,” “internalization,” and “assimilation” are used by Nonaka.^[2] The term “implicit learning” seemed to be more adequate to

enclose the whole process of socialization, gathering tacit and implicit stimuli and automatic knowledge^[17] that are involved in the process of transition from individual–tacit knowledge to collective–tacit knowledge. The term is used by Reber.^[5]

The next step of the elaboration of the matrix was then to compile all precedent elements into one single matrix. This enlarged and completed matrix (see Fig. 3) contains both succinct descriptions of various types of knowledge *within* a specific knowledge type, and all the above eight transitions (see next page). The matrix is presented here as

Fig. 3 An augmented and completed matrix of knowledge modes.

Source: From Baumard.^[4]

a guideline to read the case descriptions. It was used accordingly in the data analysis process to verify the validity of findings with precedent works, and eventually come back to more empirical work to avoid bias.

CAN MODELS EXPLAIN THE TRANSFORMATION OF KNOWLEDGE?

Can we replicate this implicit learning with a mathematical model? How would it translate? Implicit learning, i.e., the production of tacit knowledge, is a process that applies unconscious schemata and interpretation schemes to an on-going flow of stimuli, either perceived with full awareness, or perceived automatically without the awareness of the perceiver. One can consider that a complex system, e.g., organizational or organic, mechanical or biological, digital or analogical, is also treating or interpreting various stimuli in its different parts or sub-systems, without necessarily informing the other components. In fact, the historical evolution of the architecture of computers has been driven by the growth of parallel-process design, which implies that some operations, such as graphical outputs, are taken care of by different processors.

Organizations, alike, are processing large amounts of information in their different sub-systems, without the awareness—mutual or asymmetric—of other components. Unlike machines, however, these interpretations are not archived, stored, or systematically accounted for in registers, although members of organizations try their best to develop routines that capture their experience and can be eventually revised when their learning becomes ineffective.^[35] Learning in organizations is very dispersed; so dispersed, indeed, that several authors have challenged the idea that learning could fit in any fashion a category labeled as “organizational.” Noteworthy was the effort of Sandelands and Stablein^[25] who proposed that organizations ought to have a “mind” of themselves, for the results achieved by organizations out-measure individual achievements. However, because organizations comprise a category that is so varied and ambiguous, the extent to which human output can be attributed to an organization, or to an organized action, is difficult to assert. It is hence conceivable that organizations are merely temporary categories that exist in people’s imagination, according to their purpose, their intended level of outreach or discretion, their expectations and the framing of events, contexts and people that create the most comfortable and actionable setting. In this perspective, Morgan^[36] proposed that organizations are products of metaphors, which people use to explain their intended action, or lead other people to conform to an ideal-type of action that they wish will take form. Such metaphors can be machines, like Frederick Taylor’s scientific management; organisms, like the neo-institutionalists’ vision of organizations as biotopes of living organisms in symbiosis or adversity; brains like Wiener’s

cybernetics,^[37] etc. Morgan coined the term “imaginisation” to suggest that the boundary between action and knowledge is nothing other than an academic one: action is knowledge, and knowledge is action.

Indeed, cognitive science has long identified knowledge as symbolic representations stored in the brain,^[38] but Morgan suggested that what we label actions and what we label knowledge are the same reality, put in two differently imagined categories. Yet, imagination, as Morgan sees it, is still a representative form. Following Morgan, one can agree that knowledge is embodied into organizational structures, and that, accordingly, organizational structures might be projections of human knowledge. But following this path, if we admit that knowledge is partly embodied into people, we cannot assert that people are the exact projections of their knowledge. Von Krogh and Roos^[39] noted that most academic and business evocations of knowledge are directed by an epistemology that sees knowledge as a representation. This “representationist” bias fails to capture two phenomenon: (1) knowledge’s propensity for its autonomous development,^[4] i.e., the fact that representation never captures exhaustively the knowledge it addresses combined with the fact that knowledge continues to grow, within individuals, within organizations and groups, without any form of control, and, eventually, awareness, of its beholders and (2) knowledge being transformed, and acted upon, outside of the realm of representation; swimming being a striking example of an action based on a knowledge that escapes representation while being applied.^[40]

There are several examples of forms of knowledge that do not require any form of representation to be applied; and do not require a tight coupling between application and output to generate learning. Lave and Wenger^[23] identified “communities of practice” as such a phenomenon. Representation may take place, but most of the learning is acquired by mimicking, listening, intuitively adapting to peers in sharing a practice. Apprentice masons and midwives are examples. Weick and Roberts^[24] note that high reliability organizations depend upon a “collective mind” shared by operators, as they conduct perilous and complex tasks. Once again, this collective mind made of mindful interactions, of mutual awareness, of tacit and implicit behavioral coordination does not require a representation to be efficient. On the contrary, excessive efforts to represent and codify high reliability organizations through checklists and normative rules, may increase the risk of failures and accidents.

LITTLE EVIDENCE, ABUNDANT MYTHS

Hence, most theories about knowledge creation in organizations are merely fantasies, which reflect more the observers’ rational myths and beliefs, than capturing how knowledge is produced and transformed in organizations. As Starbuck put it, “scientific rationality is a fantasy that appeals us aesthetically, but it violates its own rules,

distorts our observations, and extrapolates incomplete knowledge to ridiculous extremes.”^[41] Among those fantasies, some are long lasting, displaying a strong congruence with widely shared practices. For example, it is assumed that learning is achieved through the application of knowledge; hence asserting that knowledge comes to human awareness through its application. This perspective on learning has led to the differentiation of information and knowledge, by stating that knowledge is produced through the application or experimentation of information to a given context, hence defining knowledge as “applied information.” Unfortunately, experimental evidence is still lacking to demonstrate a linear causality between knowledge, its application and learning. While Argyris and Schön^[42] stated that human beings improve awareness through “double-loop learning,” i.e., learning about their learning through observing the gaps between the outputs of their “theory in use” and their on-going actions, Van de Ven et al.^[43] provided evidence that disruptive innovations are not the outputs of an action–reaction chain of events. In other words, disruptive inventions are not the result of either single-loop or double-loop learning. They occur through the use of knowledge that clearly escapes scientific explanations. While one can agree that knowledge is both created and preserved through its application, it is impossible to observe a direct correlation between the application of knowledge and an increase in learning, and therefore, the continuation or improvement of knowing. A possible explanation for this lack of evidence may be found in the fact that most knowledge transformation is tacit, much alike a young swimmer who discovers the automatic coordination of his members in an indescribable “flowing” movement. In fact, the tenets of the autopoietic theory of knowledge maintain that “knowing is effective action, that is, operating effectively in the domain of existence of living beings” (p. 29).^[44] Such a perspective defends the idea that knowledge creation is self-contained, and hence cannot be projected on any other dimensions than personal perception.

Fundamentally opposed to the idea that knowledge is a commodity, codified or not, Maturana and Varela (p. 74)^[44] “admit knowledge whenever we observe an effective (or adequate) behavior in a given context, i.e., in a realm or domain which we define by a question (explicit or implicit).” Hence, inspired by Polanyi’s automatic knowledge, defenders of this perspective reject the idea that knowledge pursues a purpose or an object. They sum it up nicely: “All doing is knowing and all knowing is doing.” (p. 27)^[44]

IS KNOWLEDGE MERELY A TEMPORARY ARTIFACT OF BEHAVIOR?

Hence, Maturana and Varela underline a phenomenon long known by behaviorists: the tendency of human beings to exaggerate their aware participation in the

production of knowledge and learning. Behaviorists have asserted that such misperceptions are driven by the tendency of scientists to give exaggerated attention to consciousness, instead of making behavior the points of their attacks. When doing so, it is rather clear that the link between problems and solutions, knowledge and its application, acting and learning, is rather shallow, ambiguous, irrational and often, political. Starbuck^[45] observed that people are mostly “action-generators.” Captured in the flow of actions, escalating their deeds to emerging behaviors, people have sets of solutions and sets of problems; and they try to match the available solutions with the available problems, aiming at maintaining a satisfying congruence and consistency as an acceptable level. Organizational politics ask people to be “solutions providers,” while organizational belief in rationality asks them to display themselves as “problem solvers.” In such a dialectic tension, knowledge becomes alternatively a repertory of solutions to fix random flows of problems, or an invented solution to fix an unsolved problem.

Moreover, most learning is biased by the expectations of rewards and incentives that people know of, or imagine. People tend to adopt behaviors that they believe will trigger rewards, or eventually display those behaviors, even if not much learning is involved. Accordingly, people engaged in “placebo interactions”;^[33] engaging in behaviors, knowledge production and exchange, learning activities that pursue the goal of maintaining vital on-going social interactions, whatever the usefulness, meaningfulness, productivity of those behaviors and knowledge. Of course, organizations favor behavioral control over cognitive efficiency, because behaviors are observable, measurable, and therefore can be used as a sanction/reward platform. It is hard to imagine Tolman^[46] rewarding his rats for their cognitive performance, congratulating them for the accuracy of their cognition; yet, Tolman by rewarding their behaviors learned much about their cognition. This is much the same as organizations that reward behavior, aiming at producing efficient cognition among their members. Tolman hence discovered that rats possess “cognitive maps,” i.e., they register the most efficient path towards the promised reward, and reapply it when they recognize a similar situation. But only 36% of Tolman’s rats had correct maps,^[47] which beats a random choice between all the possible paths, but does not reassure scientists regarding whether a rat sense of smell would simply outbid its sense of orientation.

IS KNOWLEDGE REALLY ESSENTIAL TO SURVIVAL?

Another widespread fantasy states that human beings have progressed in society and survivability through their superior knowledge among all living species. The accumulation of knowledge is, indeed, a unique property of human

beings; however, science has not reached a sufficient level of investigative power to demonstrate that other species do not accumulate knowledge in other forms than thoughts, representations, and physical embodiments.

The fact that human beings are fully aware of the importance of their procedural and abstract knowledge leads them to attribute to knowledge all kinds of sources of superiority. While, in fact, people survive in spite of gross errors of perception, repeated throughout their personal and collective history. Starbuck and Mezias^[48] wondered if people in organizations had accurate knowledge of objective facts concerning their environment, and decided to investigate. They found that managers have erroneous perceptions that can range from 30% to 300% of objective values, on such common information as their company size, the volume of the sales, or what their company does. Hence, knowledge theorists have tended to attribute exaggerated causal and explanatory power to cognitive phenomena, often forgetting that the human ability to adapt, while being fully ignorant, may well be the main source of their resilience and organizational performance. Cognition follows behavior, as much as behavior follows cognition; but when they happen simultaneously, in such an intertwined organic relation, it is rather difficult to determine which one commands the other, and on which occasion. As Starbuck (p. 357)^[47] put it: “Behaviorists have long maintained that cognition is only a subcategory of behavior and subject to the same laws as other behavior. (...) Certainly, behaviorists have had little success in demonstrating that behaviorist theories explain complex cognitive behavior, and behaviorist psychology has not subsumed cognitive psychology.”

IS “KNOWING” TRULY SEPARABLE FROM “BEING”?

Indeed, the variability of preferences, and the volatility of aspirations over time and according to contexts, makes it difficult to generalize *ex ante* normative rules of cognition. Prior experiences influence how stimuli are selected and perceived, and in turn, new stimuli can revise previous experience. A new and scarce configuration of data may well become the new model, while all sets of previous models can no longer handle new stimuli. Hence, both models and stimuli are in real life interchangeable. A new stimulus can carry a whole model, and models in turn, turn into old and prior stimuli. The fallacy about explicit knowledge lies in the fact that data, information, knowledge, models, and stimuli belong to a configuration that is so unified, that any attempt to disaggregate them turns their properties into an artificial reduction. This integrated perspective on knowledge owes much to Gestalt psychology. In 1922, in his book *Nature and Human Conduct*, the American philosopher Dewey^[49] identified two forms of knowledge: *knowing how* (that gleaned through habit and intuition) and *knowing about* (which implies reflection

and conscious appreciation)—practical knowledge and constructed knowledge. Dewey theorized that both learning through practice, and generalizing from practice, form a single, unique continuum. Disaggregating or sequencing the phenomenon of *knowing* from experiencing, acting, doing, or being, is empirically impossible. Such divisions or abstractions are indeed quite recent in the knowledge-studies literature. Early studies focused on understanding why such a disaggregation could not, or *should not*, be attempted.

For a better appreciation of the agonies of interpreting practical knowledge we have to return to the nature of experience, as expressed in the tenets of Gestalt psychology. For Christian von Ehrenfels, founder of the movement in the 1890s, actions of a complex order are carried out by being divided into relatively routine tasks, each of these able to be executed without recourse to thought or conscious reflection. Here we find the source of Taylorism, which turned human endeavor into a “division of chores” (chores that become automatism) and opened the way for assembly line production. The central idea of Gestalt psychology is that our perceptual experiences do not emerge as a result of the conscious or unconscious application of rules or concepts to data received from our sensory receptors, but that these experiences come from an immersion in a perceptual environment in which the information we perceive already carries meaning. Perception is then an indivisible holistic structure, uniting our lived experience and the experience we are in the process of living, and it is through continually looking back on our experience that we construct a repertory of perceptual structures.

Gestalt psychology raises the question of recognition, which is little studied in management. It explains how we can recognize a person instantaneously by their physiognomy even from some distance, even though we may not be able to precisely make out their features. Recent research on organizations’ cognitive maps is not so far from this concept, while having little relation with Tolman’s rats. This capacity for recognition would allow us to automatically take appropriate action in a given situation, without having to make an effort to analyze and decide what approach to apply. The Gestalt psychologists’ argument is that our sense-making capacities are indivisible from a physiological–psychological whole, which embraces both thought and perception.

PUTTING KNOWLEDGE BACK WHERE IT BELONGS

It is in our everyday learning, in the development of our practical knowledge, that these automatisms are deployed. At least this was the central argument advanced by Merleau-Ponty^[50] in 1941, in a veritable defense of practical knowledge. Through practice we acquire patterns of behavior—skills such as walking, running, and speech—

which we can then call up spontaneously. In 1966, Polanyi^[30] continued this study of tacit knowledge by looking at similar kinetic phenomena. We learn how to swim, to co-ordinate our movements, to float, in the context of the experience itself, and “we know more than we can express.” For Merleau-Ponty, these patterns become “a part of us.” It was in the repetition of practice that Merleau-Ponty saw the true nature of human learning.

The valuation of cognition results is itself problematic, as people do not have absolute rules to value knowledge. In fact, most informational behavior of human beings is somehow “positional,” in Hirsch’s terms.^[51] People seek to gain information that allows them to gain a positional perspective, i.e., to position their own past experience in relation to the new one, while asserting their own position towards the new situation. Information superiority is hence more a theoretical construct than an organizational reality. People do not see information as having absolute superior value, but rather an immediate, practical leverage for their on-going programs. Rather than challenging the information being used and articulated in on-going programs, people favor collateral and *ad hoc* organizations, which would leave their main programs untouched, and their deeds unchallenged.^[20] Programs emerge from action-generation, and in turn, learning follows the emergent paths of action. In essence, most human knowledge is therefore conjectural, and implicitly collated in the face of action dilemmas. As social researchers, we are all working under the assumption that our efforts at generalization, explanation, and rationalization of management are an urgent need for organizations. What the case tells us is not to forget the unsaid, the unreadable, the erratic, and the mutable in our genuine assumptions. It seems that we blind ourselves from conjectural knowledge and forms of intelligence that proceed obliquely. As Detienne and Vernant put it, “there has been a prolonged silence on the subject of the intelligence of cunning” and the powerful reason behind that silence may well be a “concept of Platonic Truth, which has overshadowed a whole area of intelligence with its own kind of understandings,” and “has never really ceased to haunt Western metaphysical thought” (p. 318).^[52]

Department of Electrical Engineering and Computer Science, University of Tennessee, Knoxville, Tennessee, U.S.A.

Abstract

Latent Semantic Indexing (LSI) is a proven successful indexing and retrieval method. This method is based on an automated, mathematical technique known as singular value decomposition (SVD). Given a large information database, LSI uses SVD to create a “semantic space” of the document collection where both terms and documents are represented. It does this by producing a reduced dimensional vector space in which the underlying or “latent” semantic structure in the pattern of word usage of the document collection emerges. Similarities between terms, terms and documents, or documents in the document collection are then based on semantic content not on individual terms. This ability to extract meaning of terms and documents has given LSI success in many different applications.

INTRODUCTION

This entry describes and explains the concepts and theories related to a well known and highly successful automatic information retrieval and analysis technique known as Latent Semantic Indexing (LSI). Given a large information database where the text is heterogeneous and the vocabulary varies, documents and terms in the database are indexed by an underlying or “latent” semantic structure in the pattern of word usage defining the documents. This characteristic of LSI is what gives the technique its name.

Prior to LSI, most information retrieval systems matched words in a user’s query with words in documents contained in the collection being searched. This approach frequently returns irrelevant information while failing to retrieve other relevant documents because people use a tremendous diversity in words to express the same concept. LSI uses a mathematical approach known as the singular value decomposition (SVD) which produces a vector space with single vector representations for each unique term and document in a given document collection. Given the vector space, LSI then uses a dimension reduction technique to produce a “semantic space” that yields improved indexing of documents based on semantic content. Relationships among documents are based on the representation and meaning of the words they contain, and relationships among terms are based on their semantic effect on all the documents in which they occur. LSI uses this reduced dimensional vector space to induce similarities among documents that may or may not contain the same terms and among terms that may or may not occur together in a document. These similarities are based upon

the meaning or semantics of word usage for the entire document collection.

This entry outlines the history of LSI and discusses the basic mechanics behind the algorithm. There is a high level description of the mathematical background for LSI, a short explanation of the computational technology, and a summary of current applications and issues involved with the use of this technique.

OVERVIEW OF LSI

History

There is an ever increasing flood of information generated by a growing number of sources. In order to make use of this information it must be organized into a manageable state where relevant and meaningful items can be accessed and correlated. The large volumes of data involved necessitate a technology that is capable of automatically indexing and retrieving desired information in a timely fashion.

Traditionally, lexical matching was used for retrieving information from a document database or collection. Lexical matching consists of matching words in a user’s query with words in the documents contained in the collection. This technique proves to be inaccurate as it often times retrieves irrelevant results for a given query while failing to return other relevant documents that do not contain exact term matches. The problem is linked to variability in vocabulary and word usage. There is a tremendous amount of diversity in the language or words people use to describe a single concept. This is known as synonymy.

Research shows that two people will pick the same term for a given object less than 20% of the time.^[1] Synonymy can lead to poor recall in queries where the ratio of the number of relevant documents retrieved to all the relevant documents that exist in a document collection is low.^[2,3] Related information may not be retrieved because the concept in a given query is not expressed using the same words as in the documents. People may also use the same word to express several different concepts or meanings. This is known as polysemy and can lead to poor precision in queries where the ratio of the number of relevant documents in the set of documents retrieved is low.^[2,3] Irrelevant information could be retrieved because a word might be used differently in a document than it is in a given query, essentially misunderstanding the context in which the word was used. An ideal retrieval system would have both high precision and recall for any given query.

In 1988, a group at Bell Communications Research (Dumais, Furnas, and Landauer) as well as Deerwester from the Center for Information and Language Studies at the University of Chicago and Harshman from the University of Western Ontario first published a new approach to indexing and retrieval known as “Latent Semantic Indexing” which used an automated technology to overcome term-matching retrieval problems.^[2,4] They originally set about to develop a solution for helping people find desired services in the Bell System Yellow Pages. Users had trouble finding services due to the fact that their searches or queries used many more words (with similar meanings) than were used to index the information in the document collection.^[1] This group chose to overcome the term-matching retrieval deficiencies by using a statistical approach to organize documents in a collection into a semantic structure better suited for retrieval. This approach developed into what is now LSI. Large document collections, consisting of large amounts of text, were automatically analyzed to induce knowledge about the relationships among terms and documents such that the retrieval system could identify when a user’s query words meant about the same as the words the system used for indexing.^[5] This approach exploited the concept that the content of a document is not based on its individual words, but rather that there exists some underlying or “latent” structure in the pattern of word usage. LSI attempts to estimate this latent structure and eliminate the noise that is present due to variability in word choice. Indexing of documents in the document collection is based on the estimated latent semantic structure. As a result, the similarity of documents is not determined by the exact words they contain but on the semantic content.^[6]

LSI is considered a variant of the traditional vector space model (VSM). The vector space model was developed to handle text retrieval from a large information database with heterogeneous text and varied vocabulary. One of the first systems to use a traditional VSM was the System for the Mechanical Analysis and Retrieval of Text

(SMART).^[7] Among the notable characteristics of the VSM is the premise that the meaning of documents can be derived from its components. The underlying formal mathematical model of the VSM defines unique vectors for each term and document. Queries are performed by constructing a vector to represent the query and then compare this query representation to the representation of each document in the vector space.^[8] LSI uses a reduced dimensional VSM. Query-document similarities are then based on concepts or similar semantic content.

Basic Mechanics of LSI

LSI is a fully automatic technique for extracting and inferring the meaning of terms and documents. Prior to the development of LSI, these tasks involved significant human intervention. To obtain the “latent” structure of the document collection, LSI processes a large collection of machine-readable text that consists of multiple documents. No human dictionaries, semantic networks, grammars, syntactic parsers, or morphologies are used; therefore, no preconceived knowledge about the physical word, word order, syntactic relations, or morphology is incorporated in the processing. Only raw text separated into documents is taken as input. Documents are a predetermined size of text such as paragraphs, collections of paragraphs, sentences, book chapters, books, etc. depending on the application. These documents are parsed into terms, which are the individual components that make up a document. Typically, terms are words, but they can be phrases or concepts, also depending on the application. The terms and documents are organized into a single large matrix which is then processed using the SVD matrix decomposition technique.

The SVD produces a vector space from the document collection, which is considered the “semantic space,” where vector representations for both terms and documents are produced simultaneously. Within this “semantic space,” the meaning of a term is represented as the average effect that it has on the meaning of documents in which it occurs.^[5,9] Similarly, the meaning of a document is represented as the sum of all the words it contains. Each term and document is represented by a single vector, with each vector having a certain number of elements or dimensions in the vector space. The SVD allows for the adjustment of the representation of terms and documents in the vector space by choosing the number of dimensions. This controls the number of parameters by which a word or document is described. Usually the number of dimensions is much smaller than either the number of terms or documents, but still is considered a large number of dimensions (typically 200–500 dimensions). This reduction of dimensionality is the key to sufficiently capturing the underlying semantic structure of a document collection. It reduces the noise associated with the variability in word usage and causes minor differences in terminology to be ignored.^[2]

Selecting the optimal dimensionality is an important factor in the performance of LSI. The conceptual space for a large document collection needs more than a few underlying independent concepts to define it, but the semantic space is overly distorted by using too few dimensions.^[4] Using full dimensionality regenerates the original data matrix and provides no semantic grouping of terms and documents, considering every term and document to be unique in meaning.^[6] On the other hand, using a low number of dimensions is undesirable as it does not produce enough differentiation between terms and documents. Essentially too many terms and documents would be considered identical in meaning. Optimal dimensionality is what gives LSI its powerful retrieval effectiveness. For a pictorial representation of the effects of dimensionality in the semantic space and its relation to success of LSI in a word knowledge test, see Landauer.^[15]

The difference between the traditional VSM and the reduced dimensional VSM used by LSI is that terms form the dimensions (the axes) of the vector space in the traditional VSM and documents are represented along those dimensions. Therefore, since the terms are the axes of the vector space in the traditional VSM, they are orthogonal (90°) to each other, causing documents that do not contain a term in a user's query to have a similarity of zero with the query. The result is that terms have their own unique independent meanings. In LSI, however, the dimensions are derived from the SVD not the terms themselves. These derived dimensions are orthogonal, but terms (as well as documents) are vectors in the reduced dimensional space. Terms no longer have unique meaning on their own, nor are they independent. Terms get their meanings from their mappings in the semantic space. The location of the term vectors reflects the correlation of the term's usage across documents in the collection, thus, it carries all of the term's senses (all the different ways in which the term has been used).^[5,10]

In this reduced dimensional vector space produced by the SVD, the closeness of terms and documents can be determined by examining the position and proximity of term and document vectors. Terms close to one another in the reduced dimensional space will be considered to have similar meaning regardless of whether or not they appear in the same document. Terms could be considered dissimilar in meaning because they are far away from each other in the vector space even though they occur in the same document. The closeness of documents is determined by the overall pattern of term usage for the document. Documents can be similar to each other, having close proximity in the vector space, regardless of the specific words they contain.^[6,9] The position of terms and documents in the vector space serves as a "semantic indexing." Users' queries are projected into the vector space, and documents in the neighborhood of the projected query are returned in ranked order, with the most similar document being first. The nearby documents need not share any terms with the

user's query since the location of the query in the vector space is determined by the underlying semantic structure of the document collection, patterns of term usage across documents.^[2]

MATHEMATICAL BACKGROUND

LSI consists of four basic steps.

Assembling the Term–Document Matrix

Given a large collection of text, documents are first preprocessed. Oftentimes, documents must be filtered to remove unwanted information. Documents might contain graphical images, tables, charts, etc. that may need to be removed. There are also unnecessary tags and features that help identify how the documents are organized or formatted which may need to be omitted because they add no semantic content to the document. Stemming and stoplisting might also need to be applied to the words in the documents. Stemming is the removing of suffixes to reduce a word to its root form. Stoplisting is simply the filtering of words that have little or no value to the semantic content of the documents, such as "the," "a," "of," "about," etc.^[3] With stemming and stoplisting, there is always a risk of losing valuable information.

The cleaned documents are then processed to construct a term-by-document matrix. The columns of the matrix stand for the documents and the rows represent terms. Often, with smaller document collections the number of terms is greater than the number of documents. However, as the volume of information increases and the document collections become larger, the opposite (more documents than terms) is more frequently the case. Initially each column of the matrix contains zero and nonzero elements. Each nonzero element or cell of the matrix is the frequency with which the term occurs in a document. The term-by-document matrix is considered sparse because it contains many more zero elements than nonzero elements. Each document in the collection tends to only use a small subset of terms from the entire unique term set. Usually about 1% or less of the matrix entries is nonzero.^[3]

Weighting Elements of the Term–Document Matrix

The second step of LSI is to apply a local and global weighting function to each nonzero, term–frequency entry, in the term-by-document matrix in order to increase or decrease the importance of terms within documents (local) and across the entire document collection (global). Terms that best distinguish particular documents from the rest of the documents in a collection are the most important; therefore, a weighting function should give a low weight to a high frequency term that occurs in many documents

and a high weight to terms that occur in some documents but not all.^[8] Applying a weighting function generally improves retrieval performance. The local and global weighting functions for each cell are usually directly related to how frequently a term occurs within a document and inversely related to how frequently a term occurs in documents across the collection, respectively. For a more detailed description on different types of local and global weighting functions, see Dumais.^[6] A common local and global weighting function that dampens the effect of large differences in term frequencies within a document and that takes the distribution of terms over all documents is log-entropy. The local weighting function of log is defined as $\log(tf_{ij} + 1)$, and the global weighting function of entropy is defined as

$$1 + \sum_j \frac{p_{ij} \log_2(p_{ij})}{\log_2 n}$$

where $p_{ij} = tf_{ij}/gf_i$, tf_{ij} = term frequency of term i in document j , and gf_i = the total number of times that term i appears in the entire collection of n documents. It has been found that log-entropy gave the best retrieval results, 40% over raw term frequency, on several standard document collections.^[6]

Producing the Reduced Dimension Vector Space

Given a rectangular term-by-document matrix A , A can be decomposed into the product of three other matrices using SVD.^[11] Thus the SVD of matrix A is

$$A = T * S * D^T$$

where T is an orthogonal matrix, D is an orthogonal matrix, and S is a diagonal matrix. The first r , where r is the rank of A , columns of the orthogonal matrix T contain r orthonormal eigenvectors associated with the r nonzero eigenvalues of $A * A^T$, and the first r columns of the orthogonal matrix D contain r orthonormal eigenvectors associated with the r nonzero eigenvalues of $A^T * A$. The first r diagonal entries of S are the nonnegative square roots of the r nonzero eigenvalues of $A * A^T$ and $A^T * A$, and are in decreasing order. The columns of matrix T are known as the left singular vectors, and the columns of matrix D are known as the right singular vectors. The nonzero diagonal elements of S are known as the singular values.^[11,12] The rows of matrix T correspond to the term vectors, and the rows of matrix D correspond to the document vectors. The SVD simply rerepresents matrix A using orthogonal indexing dimensions.^[10]

If only the k largest singular values and their associated singular vectors are kept then the SVD of A is truncated to

$$A_k = T_k * S_k * D_k^T$$

which is the reduced dimension SVD. The matrix A_k is the best or closest (distance is minimized) rank k approximation to the original matrix A .^[12,13] The matrix A_k is created by ignoring or setting equal to zero all but the first k elements or columns of the term vectors in T , the first k singular values in S , and the first k elements or columns of the document vectors in D . A pictorial representation of the SVD of term-by-document matrix A and the best rank- k approximation to A can be seen in Fig. 1.^[12,14] The k -dimensional vector space, where the rows in T_k are the term vectors and the rows in D_k are the document vectors, is the foundation for the semantic structures LSI exploits. By reducing the dimension from r to k , extraneous information and variability in type usage (referred to as “noise”) that is associated with the database or document collection is removed. Reducing the dimension is what captures the important underlying semantic structure of terms and documents. Terms similar in meaning are “near” each other in k -dimensional vector space even if they never co-occur in a document, and documents similar in conceptual meaning are near each other even if they share no terms in common.^[12]

The best selection for the number of dimensions to use in the space remains an open question. In practice, the choice for k is much smaller than the number of terms or documents in the term-by-document matrix and usually depends on empirical testing. As described earlier, too few dimensions or too many dimensions result in poor performance. For large datasets, empirical testing shows that the optimal choice for the number of dimensions ranges between 200 and 500. Currently there exists no theory to explain this observation nor is there any method to accurately predict optimal dimensionality.^[5,15] There are however a few techniques mentioned in Dumais^[10] for estimating k .

Querying in the Reduced Dimension Vector Space

Since both term vectors and document vectors are represented in the reduced dimensional vector space, similarities between two terms or two documents or a term and a document can be computed. Most often the cosine

Fig. 1 Diagram of the reduced dimensional SVD for the term-by-document, $m \times n$, matrix A .

(which is the angular distance between two vectors) is used as a measure of similarity because of its relation to the dot-product criterion and its effectiveness in many information retrieval applications.^[4,10,15] The dot product of two vectors $\mathbf{u}$ and $\mathbf{v}$, where $\mathbf{u} = (u_1, u_2, \dots, u_n)$ and $\mathbf{v} = (v_1, v_2, \dots, v_n)$, is the sum of each element in $\mathbf{u}$ multiplied by the corresponding element in $\mathbf{v}$, so $\mathbf{u} \cdot \mathbf{v} = (u_1v_1 + u_2v_2 + \dots + u_nv_n)$. Thus, term-term, document-document, and term-document similarities are easy to compute. New vectors for new terms and/or documents can be added to the existing space by a process called *folding-in*. This same process is used to project queries into the vector space. A query is treated as another “document,” and the query vector is located at the weighted average of its component term vectors or at the centroid of the component term vectors in k -dimensional space. Then the query vector is compared to document vectors to find the most similar documents. The documents corresponding to cosines greater than a certain threshold are ordered by their nearness to the query vector and returned as the results of the querying process.^[12]

For a thorough description on the mathematics supporting LSI refer to Deerwester,^[4] Berry^[12] and Martin.^[14]

LSI Example

To illustrate the capability of LSI a very small example is presented here. A small document collection consisting of book titles and authors is shown in Table 1. There are 13 documents in the collection, and the terms are words appearing at least twice in the document collection. There are 13 terms, shown in boldface in Table 1. The corresponding term-by-document matrix is found in Table 2. The entries in the matrix are all zeros except for the cells corresponding to terms found in each document. Those cells are the frequency with which the term occurs in the documents. Even though this is a small example, the matrix is still sparse with approximately 22% of the matrix cells being nonzero. In this example, only the term frequency is used for the local weighting function, and no global weighting function is applied. If the term-by-document matrix is decomposed using the SVD and term and documents vectors are obtained, the dimensionality of the vector space can be reduced to two dimensions. Of course, two dimensions are never used in practice with large document collections, but for this small collection and for the sake of visually illustrating LSI only two dimensions are used here. The two-dimensional vector space for this document collection can be seen in Fig. 2. If a user wants to find documents related to the query “Henry Ford,” a vector corresponding to the query can be projected into the vector space, as seen in Fig. 2, and then the query vector can be compared to the document vectors by computing the angle between it and all the document vectors. The cosines between the query vector and all the document vectors produce a list in decreasing order. The documents

D11	<i>The Lady Mechanic's Total Car Care for the Clueless: A Manual for Car Owners</i> by Ren Volpe
D12	<i>Everything Women Always Wanted to Know about Cars; But Didn't Know Who to Ask</i> by Lesley Hazelton
D13	<i>Henry's Lady: An Illustrated History of the Model A Ford (The Ford Road Series, Vol. 2) by Ray Miller and Glenn Embree</i>

corresponding to the highest cosines are deemed most relevant to the query “Henry Ford.” The top five documents deemed relevant to the query, which are those documents with cosines greater than 0.95, can be seen in Table 3. Notice that the top document is about the Ford model A and that the top five documents are all about cars or automobiles even though the book titles for D11, D12, and D5 contained none of the query words. The document corresponding to D5, *The Automobile (Inventions That Shaped the World)* by Robyn Conley, is definitely relevant to “Henry Ford,” one of the first to mass produce automobiles which shaped the world. Another observation is that of all the relevant documents returned only one contains both of the query terms. If the cosines are computed between the query vector and the document vectors based on a lexical matching then only cosines for D3, D4, and D13 are computed and returned. Of course, D13 is deemed the most relevant in lexical matching, but obviously some relevant documents are missed, such as D5 *The Automobile (Inventions That Shaped the World)* by Robyn Conley.

Using this small example, a new document can be added to the existing vector space by *folding-in*. If a new document, “Fashion (*Oxford History of Art*) by Christopher Breward,” labeled D14 is to be added to the semantic space, the document vector is projected into the vector

space at the centroid, or weighted average, of its constituent term vectors, which are “art,” “fashion,” and “history” in this case. Fig. 3 shows the new document being placed in the existing vector space for this small book title example. Notice its placement, at the centroid of the vectors corresponding to “art,” “fashion,” and “history.” The new document vector, D14, is near D2, D7, D9, and D8 which are all about artwork and fashion.

COMPUTATIONAL TECHNOLOGY

The automatic computation of the reduced dimensional vector space for a term-by-document matrix derived from a given document collection is a nontrivial calculation. Given a large term-by-document matrix A where there are more terms than documents, the SVD computation becomes a problem of finding the k largest eigenvalues

Fig. 2 The two-dimensional vector space for the book titles found in Table 1 with the vector corresponding to the query “Henry Ford.” Legend: Diamonds are documents found in Tables 1 and 2 with the labels D1-D13. Crosses are terms found in Tables 1 and 2 with the labels T1-T13 along with the actual word.

and eigenvectors of the matrix $B = A^T A$. Finding the eigenvectors and eigenvalues of B produces the document vectors and the singular values (the nonnegative square roots of the eigenvalues of B). Then the term vectors are produced by back multiplying. If there are more documents than terms, then computing the SVD is reduced to finding the k largest eigenvalues and eigenvectors of $B = A^T A$. In this case, finding the eigenvectors and eigenvalues of B produces the term vectors and the singular

values, and the document vectors are produced by back multiplying. To summarize, given the symmetric matrix B , which is created from the sparse input matrix A , the objective is to find the k largest eigenvalues and eigenvectors of B . Thus, the SVD computation is based on solving a large, sparse symmetric eigenproblem.^[11,16]

Currently the technology most often used to compute the SVD is based on the Lanczos algorithm. The Lanczos algorithm, which is an iterative method, is proven to be accurate and efficient in solving large, sparse symmetric eigenproblems where only a modest number of the largest or smallest eigenvalues of a matrix are desired.^[11,17] The Lanczos algorithm, used to compute the k largest eigenvalues and eigenvectors of B (described in the previous paragraph), actually approximates the eigenvalues of B .^[18] In using finite-precision arithmetic, the basic Lanczos procedure suffers from the loss of orthogonality among Lanczos vectors, which lead to the eigenvectors of B . Currently the best option for remedying the problems associated with finite arithmetic is to use selective reorthogonalization of the Lanczos vectors, which is known as the “Lanczos algorithm with selective reorthogonalization.”^[16,17] The Lanczos algorithm with selective reorthogonalization has made it computationally possible to produce a reduced dimensional vector space for a large document collection. With the growing amount of information available, the

Fig. 3 The two-dimensional vector space for the book titles found in Table 1 with a new document, D14 “Fashion (*Oxford History of Art*) by Christopher Breward,” folded-in the semantic space.

computation of the SVD is manageable with current computer architectures (including clusters and symmetric multiprocessors) and the advent of a highly parallel Lanczos algorithm.^[18]

ISSUES AND LIMITATIONS

There are some known issues and limitations with LSI, and a few of the most important ones are described here.

The Value of Word Order

Given a document collection, as documents are automatically read and terms parsed the implicit word order is ignored. The meaning of terms and documents is desired and achieved with LSI without concern for word order or syntactic structure. In some applications, this disregard of word order might result in incompleteness or error.^[9] However, LSI performs amazingly well at characterizing the semantics of a given document in a document collection despite the fact that syntactic information is not considered.

Computational Challenges

There are computational challenges associated with calculation of the SVD. The time and storage required to compute the SVD of a document collection correspond to the overall size of the collection, the amount of information or raw text. Larger document collections require more computation time to create a vector space as well as more storage to store the vectors. As document collections grow these scalability issues increase. There are a few solutions available for handling document sets of increasing size. One solution can be found in Martin^[19] where out-of-core capabilities for the SVD computation are explored. Another solution is the parallel SVD algorithm that is described in Berry.^[18]

Updating

As information is constantly being generated there is often a need to add new documents and terms to an existing vector space. In the simple case, new items are projected into the vector space based on the relationships between the set of term and document vectors used in the vector space creation by a process called *folding-in* (described earlier). However, the addition of new documents can change the relation among terms, and this change is not reflected in the vector space when using the *folding-in* process. As new documents are added, there is a point at which the vector space needs to be recomputed, especially for large collections with rapidly changing content. It has been found that recomputing the vector space only changes the underlying semantic space significantly if

the document collection has changed by about 20% or more.^[5] Recomputation of the SVD can be costly as described in the previous section, but the out-of-core and parallel capabilities described in Berry^[18] and Martin^[19] make recomputation more feasible. A computationally less expensive algorithm known as *SVD-Updating* has also been developed.^[12,20] However, to date there is no optimal way to add information to an existing reduced dimensional vector space which directly and accurately affects the underlying latent semantic structure of the collection that is as accurate as recomputing the k -dimensional vector space with the added information.

APPLICATIONS

Over the past two decades, LSI has been tested and employed in a wide range of problems and applications. LSI has been successful as an automated, practical tool for constructing representation of meaning. The book *Handbook of Latent Semantic Analysis* describes and demonstrates an assortment of research and applications for LSI (also known as Latent Semantic Analysis or LSA). LSI has made it possible to build a computational model for many semantic problems.^[21] There are three main categories of applications for LSI. They include information retrieval and analysis, cognitive psychology, and educational applications.

Information Retrieval and Analysis

LSI originated as a technique for improving information retrieval^[4] and has been shown to improve retrieval performance by up to 30%, being able to match user's queries to documents of the same or similar meanings without having terms in common and rejecting irrelevant documents that have many terms in common with the query.^[6] As an information retrieval technique, LSI's capabilities have been utilized to help users locate information, learn from the information, and use the learned information from online manuals. LSI-based tools can automatically present information that is adapted to an individual user's background knowledge and levels of expertise.^[21] LSI has been extended to cross-language information retrieval where users can query in one language and retrieve documents in another. The classical cross-language information retrieval method creates a multilingual semantic space by using dual-language documents, where a dual-language document is the same version of a document in two different languages concatenated together. Then other documents from the two languages are folded-in, and queries in one language can find matching documents in another language. This method has shown promising results.^[10,22] An extension to this cross-language LSI method has been developed and explored using a technique that maps a semantic space in one language into a

semantic space of another to allow for multiple (more than two) languages to be represented in one semantic space.^[23] This extension has allowed for creating of Hindi, Arabic, Swahili, and English multilingual space.^[10]

Recent work^[24] has applied LSI to the task of spam filtering. They compared the classification performance of the traditional VSM and LSI using text-based feature sets from the de-facto spam filtering system SpamAssassin.^[25] In classifying e-mail messages as spam or not spam, they demonstrated that a surprisingly large amount of truncation (or low-rank) for the SVD is often possible without a significant loss in classification performance. Although performance can greatly depend on feature (text) extraction strategies, LSI-based spam filtering has been demonstrated to be significantly better than the standard approaches offered by SpamAssassin.

Cognitive Psychology

LSI has been used for research in the field of cognitive theory, testing theories of cognition and trying to better understand the development of the human mind. Landauer and Dumais were the first to attempt to use LSI to build a psychological theory of meaning. They tried to build a system that acquires something similar to human knowledge, which in their case was a human child. LSI was able to acquire English vocabulary at a comparable rate to the vocabulary growth of an American child.^[15] This led to LSI being explored as a tool for assisting human vocabulary acquisition. Research in modeling a child's semantic memory with LSI has been explored with some success.^[21] In research conducted by Kintsch, a comprehension model incorporating LSI has been shown to accurately represent word meanings despite the fact that a word might have multiple meanings and multiple senses (for example *horses run* and *colors run*).^[21] Many more cognitive theories and processes have been explored and modeled using LSI and are described in Landauer.^[21]

Educational Applications

LSI has been used in many educational applications. LSI has been used to help to develop educational, interactive Web-based applications. Intelligent tutoring systems need to be able to capture meaning in text. Some examples of tutoring applications using LSI are the following: 1) iSTART, which helps students to better self-explain by teaching them reading strategies; 2) AutoTutor, which helps students learn a certain subject by engaging with a computer tutor; 3) Knowledge Post, which supports online learning and collaboration; and 4) Summary Street, which helps teach children how to compose a written summary of a subject by having students write summaries and giving feedback, automatically coaching them.^[21] One of the most successful educational applications using LSI is the Intelligent Essay Assessor (IEA).^[26] IEA is a full-scale

grading system that has been used commercially to score the adequacy of the content of millions of expository essays for important exams with as high a reliability as two human graders. Again please see *Handbook of Latent Semantic Analysis* for more on these applications.

CONCLUSION

Initially LSI was introduced as a technique to improve information retrieval. It makes use of a mathematical technique to create a semantic space for a document collection in a completely automatic fashion. LSI uses SVD to overcome vocabulary mismatch problems, the variability in word usage, by reducing the dimensionality of the vector space produced by SVD. The dimension reduction causes term and document vectors in the vector space to drop unimportant detail, thus, achieving optimum levels of similarity. Therefore, relevant documents can be identified and retrieved from a document collection even when the documents contain no words presented in the user's query. This dimension reduction step is what captures the underlying semantic structure of terms and documents and what has given LSI its success in many different applications.

While LSI has been used and tested in many different research and application areas with varied success, there still remain issues to be addressed or investigated. Computational issues are still a challenge for large and rapidly changing document collections, especially since the amount of information to be managed continues to grow.

Two decades after its conception, LSI is being used in many different areas other than informational retrieval with promising results. Its capabilities in information retrieval have increased. LSI has great potential for future applications and projects.

Latinos and U.S. Libraries: History

Romelia Salinas

California State University, Los Angeles, Los Angeles, California, U.S.A.

Abstract

A circumstance that has greatly impacted library services in the United States has been the increased presence of ethnically and linguistically diverse user populations. Central in this development is the Latino community, now the largest minority group in the nation. This entry provides a historical overview of the development of library and information services to the Latino community and the development of Latinos as library professionals. It highlights key policies, initiatives, organizations, and leaders who were instrumental in the development of services to this community and in the recruitment of Latinos to the profession.

INTRODUCTION

Libraries like other institutions are shaped by social, political, and cultural forces. Therefore, a history of library services must consider the social context of that time and how it fashioned its direction. A circumstance that has greatly impacted library services in the United States (U.S.) has been the increased presence of ethnically and linguistically diverse user populations. Central in this development is the Latino community, now the largest minority group in the nation. This entry provides a historical overview of the development of library and information services to the Latino community and the development of Latinos as library professionals.

The history of Latinos in the U.S. as library users and as library professionals prior to the late 1960s has not been well documented. Nevertheless, it is known that before the development of modern Latino library collections there were community libraries established by *mutualistas* (mutual aid societies) during the first part of the twentieth century for this community.^[1] It is also known that Spanish-language newspapers, such as *El Clamor Publico*, *Regidor*, and *La Voz de la Mujer*, were important vehicles for the exchange of news, information, and opinions and that by 1939 there were over 400 Spanish-language newspapers in the southwest.^[2] Finally, it has also been documented that Latino literary historiography is not a recent phenomenon, but has existed for several hundreds of years.^[3] The work by Padilla (1971) is among the few that provides an extensive review of Latino bibliographic history extending back to 1848.^[4] However, more on these early years needs to be investigated and recorded. It was not until the late 1980s that the Library and Information Science (LIS) literature began to document and to discuss issues related to information services for the Latino community.

The Civil Rights Movement of the 1960s, along with other political changes, created an environment where

questions of library services to ethnic communities began to receive attention. Legislation such as the Federal Government's Library Services Construction Act (LSCA) of 1964, the Civil Rights and Economic Opportunity Acts of 1964, and the Elementary, Secondary, and Higher Education Acts of 1965 made funds available for programs and services aimed at underserved communities.^[5,6] It was mainly during this time that library services targeting the Latino community were mainstreamed.

LATINOS IN THE UNITED STATES

The history of the Latino population in the United States is diverse, complicated, and important to know in order to better serve this community. In recent years the role of the Latino community in changing the demographic landscape of the United States has received much discussion. It is estimated that between 2005 and 2050, the Latino population will triple in size and will account for most of the nation's population growth. There were 42 million Latinos in the U.S. in 2005 and this number is expected to rise to 128 million by 2050.^[7] These estimates do not count the number of undocumented Latinos who live and work in the United States. Clearly Latinos represent a key economic, political, and cultural force in the U.S., but they are also culturally, demographically, and geographically diverse. The largest group is people of Mexican origin (64%), followed by Puerto Rican (9%), Central American (7.6%), South Americans (5.5%), Cuban-American (3.4%), and then Dominican (2.8%).^[8] They come from as many as 20 countries, speak various languages, and sometimes share very little in common with each other. Differences are apparent not only by country of origin, but also by generational status, language preferences, and socio-economic class. The information needs of a first-generation Spanish-speaking Latino will be very different

than those of a third-generation monolingual English-speaking Latina.

In addition to being a growing and diverse population Latinos are also a young community. The average age of a Latino male is 27 compared to an overall average of 35. Contradictory to popular belief more Latinos are U.S. born (60%) than foreign-born (40%).^[8] A final interesting demographic trend is that although Latinos have tended to reside in southern and western regions of the states most recently states such as Arkansas, Georgia, and South Carolina have seen a tremendous growth in their Latino populations. The geographic distribution of the Latino community is changing and expanding and libraries in impacted communities need to be prepared to meet the needs of these new members.

IDENTITY LABELS

The demographic profile of the Latino community highlights the diversity within the community. For this reason, it is important for libraries to learn as much as possible about the Latino community in their service area before making investments in collections, programming, services, publicity, and staffing.^[9] Along with this task is the need to learn about the identity politics of that particular community. Terms such as "Latino" and "Hispanic" are often used interchangeably to generally refer to this population, but it is important to understand the semantics of such words. Latino is employed as a generic descriptor for people from Latin American descent. While the term Hispanic, instituted by the federal government, refers to Spanish-speaking people residing in the U.S., this term is often criticized for excluding those who are not Spanish-speaking, as well as for stressing Spanish ancestral origins over indigenous and other racial influences which make up the Latino heritage. Both terms (Latino and Hispanic) are somewhat problematic in that they group together people from many geographically and culturally diverse regions. A number of other labels have been applied to this ethnic group by the literature, such as Raza, Spanish-speaking, Spanish-surnamed, Latin, Spanish, Latin American, Hispano, and Chicano/a. Arguments have frequently been presented for the advantages of one over the other.^[10,11] Libraries need to be sensitive to the identity politics that certain labels carry for sectors of this community as they provide services to them. Preferred terms usually reflect local preferences and may differ by generational status, age, class, as well as other variables.

LATINOS AND LIBRARY SERVICES

The Civil Rights Movement set in motion a process that brought ethnicity into the forefront of many societal

discussions. Racial minority students across the United States began to demand courses and studies depicting their ethnic heritage and contributions to U.S. society. The growth of these programs stimulated the development of library collections in these areas, including collections reflective of the various Latino populations.^[5] At that time the American Library Association (ALA) was not known to be a bastion of support for library services to Latinos.^[12] Although ALA lagged behind mainstream America in efforts aimed at addressing the needs of Latinos it eventually established the Committee on Library Services to the Spanish-Speaking in the mid-1970s. In 1978 *Library Journal*, published the "Guidelines for Library Services to the Spanish-Speaking" by Yolanda Cuesta and Patricia Tarin.^[13] In 1988 ALA also adopted the policy, "Guidelines for Library Services to Hispanics" which was prepared by the Library Services to the Spanish-Speaking Committee of what was then called the Reference and Adult Services Division, now the Reference and User Services Association.^[12]

The development of library and information services to the Latino community called not only for the creation of guidelines and targeted initiatives; it also necessitated the establishment of collections and access tools. The growth of collections would not have been possible without the founding of Latino focused publishers and book distributors such as Arte Publico Press (1979), the Hispanic Book Distributor (1980), and the creation of other collection development tools. For instance in 1973 REFORMA (The National Association to Promote Library and Information Services to Latinos and the Spanish-Speaking) began publishing its newsletter which included book reviews of interest to the Latino community.^[14] By 1994 *Library Journal* started "En Espanol" a semi-annual review of Spanish-language books. A more recent event has been the partnering of ALA and the Guadalajara International Book Fair. For the last 10 years this partnership has awarded librarians who work in the area of Spanish-language acquisitions funds to attend the Fair. Finally in 2002 *Criticas: An English Speaker's Guide to the Latest Spanish-Language Titles* began to be published. *Criticas* is a monthly review of Spanish-language books produced by *Publishers Weekly*, *Library Journal*, and *School Library Journal*.

As the collections grew so did the need for access tools. There were certain tools like the *Chicano Thesaurus* and *COMEXAZ* (Comite de Mexico y Aztlan) that were useful across a variety of library settings. The *Chicano Thesaurus*, a subject-heading guide used to organize Latino collections and to make searching easier was first published in 1979. *COMEXAZ*, a newspaper monitoring and indexing service established in 1972, ceased service in 1980.^[1] Both of these tools were instrumental in increasing access to Latino materials. There were other access tools, to be discussed, created to meet the needs of particular types of libraries as well.

LATINOS AND PUBLIC LIBRARIES

Services to the Latino community within public libraries began mainly as services to the Spanish-speaking. There have been many initiatives targeting the various sectors of the Latino community throughout the United States since the late 1960s. An early effort aimed at the Puerto Rican community was the New York Public Library's South Bronx Project implemented in 1967 with federal funds under the direction of Lillian Lopez. In 1970, the Cleveland Public Library initiated Project Libros.^[6] Project Libros was funded by a Library Services and Construction Act grant through the State Library of Ohio and ran until 1978. In Albuquerque, New Mexico, the Model Cities Neighborhood Library, also a federally funded project, was opened in 1973 to provide services to predominately Mexican American communities. In 1978, El Centro (The Center), a Brooklyn Public Library bilingual center was opened in the Williamsburg Branch Library. In New Jersey, the Newark Public Library inaugurated a model program in 1979 to reach New Jersey Latinas/os which lead to the founding of La Sala Hispanoamericana, a permanent program for the Latino community.^[12] In Florida, La Rama Hispanica Branch was opened in the heart of Little Havana in 1978 to serve the Cuban community.^[13] Also during the late 1970s in California the Los Angeles County Public Library established Project LIBRE (Libraries Involved in Bilingual Reading Education) and the San Francisco Public Library established the Latin American Library.^[15] Although many of the outreach programs and services were launched during the height of the civil rights era there have also been recent programs. For example under the leadership of Martin Gomez, the Serra Cooperative Library System implemented the highly successful "Latino Services Project" from 1982 to 1984.^[12] California's Partnerships for Change established in 1989 is credited for revitalizing library services to ethnic communities across the state and in 1996 the Library Service to Hispanic Immigrants of Forsyth County, North Carolina was established.^[12] In 1993, Project Colorin-Colorado was started in Miami-Dade Public Library System to create and perform special programs in libraries to celebrate Hispanic Heritage Month. The San Antonio Public Library instituted the Lea Por Vida (Read for Life) program in 1995, a joint project with the WIC (Women, Infants, and Children) program to combine health education with an introduction to library services. These programs vary in focus, but all provided culturally relevant collections and programs and hired bilingual and/or bicultural staff. However, these projects in public libraries were developed with special funding, such as LSCA grants, and were never fully integrated into ongoing budgets, causing the projects to be weakened or eliminated over time.

In recent years public libraries have seen a dwindling in government funding causing them to seek out other sources of capital. A current example is WebJunction's

Spanish-Language Outreach Program funded by the Bill and Melinda Gates Foundation. This program, piloted in 2004, helps equip local library staff with knowledge and resources to reach out to Spanish-speakers in their communities and to increase their access to technology.

Central to public library initiatives was the development of collections to meet the needs of the Latino community they served. In general, public libraries focused on the development of Spanish-language collections to serve the Spanish-speaking patron, which is different than developing collections with a focus on the Latino experience. Latino focused collections remained for the most part removed from the community located in institutions of higher education. It was not until the mid and late 1970s that a few of such collections began appearing in public libraries while such collections were created in academic libraries in the late 1960s.^[11] One of the earliest resources established in a public library was the Chicano Resource Center of the Los Angeles County Public Library (1976) located in East Los Angeles, the heart of the Latino community.^[11]

Although a wide range of models to improve public library services to Latinos were implemented during the late 1960s and early 1970s the development of an appropriate indexing system to ensure access to Spanish-language information or to information by or about the Latino community had been ignored. Libraries soon came to the realization that greater savings would be generated by the use of an appropriate bilingual, Spanish, or culturally relevant subject indexing system. Early on the Alameda County Library in northern California began the development of Spanish-language subject headings based on a scheme called *La Lista de Encabezamientos*.^[16] Another effort to develop Spanish-language access to library materials was the California Spanish-Language Database, also known as Hispanex (Hispanic Information Exchange), which was initiated in 1977. It originated as a joint request by the East Bay Cooperative and the Oakland Public Library (now combined and known as the Bay Area Library and Information System) for LSCA funding to develop a union catalog of their Spanish-language books with subject headings in Spanish.^[17] The English/Spanish subject headings created for this catalog were published in a publication entitled *Bilindex: A Bilingual Spanish-English Subject-Heading List: Spanish Equivalents to Library of Congress Subject Headings* in 1984.^[18] The goal of this work was to provide authorized Spanish equivalents for English Library of Congress Subject Headings.

Although many efforts targeting the Latino community have occurred in the last few decades a study carried out in 1994 identified areas of weakness for public libraries. Reynaldo Ayala and Marta Steifel Ayala conducted a project sponsored by REFORMA and funded by the W.K. Kellogg Foundation to evaluate the then current state of public library services to the Latino community in the United States. The findings were published in a report

entitled *The Report Card on Public Library Services to the Latino Community: Final Report*.^[12] They highlighted that the demand for services, especially for Latino children, was growing, but lamented the fact that there were so few Latino librarians, only 1.8% of all librarians at that time.

LATINOS AND SCHOOL LIBRARIES

The advent of bilingual education legislation (Bilingual Education Act of 1968 and 1974) and program implementation changed the face of school library services. Bilingual education programs made funds available for the purchase of bilingual or Spanish-language materials for school libraries. However, what became evident was that traditional jobbers provided little assistance in locating bilingual and/or ethnic materials for schools. Therefore new distributors, such as Las Americas and Bilingual Education Services, came about to fill these particular needs.^[19] Publishers like Arte Público Press, Piñata Press, Lectorum, and Children's Book Press have also been helpful in seeking out quality materials produced by non-mainstream publishers.

Advocates for services to Latino children and youth have stressed the importance for children to have access to reading materials that portray their cultural heritage in a positive manner. Dr. Isabel Schon, Director of the Barahona Center for the Study of Books in Spanish for Children and Adolescents, has been a leader of this campaign. She has led an active career dedicated to research in the area of materials for children and young adults and continues to provide reviews and recommended reading lists for children and adolescents.

As the availability of Latino themed children's books grew book awards were instituted to encourage creativity and quality works. The Pura Belpré Award was established in 1996 by REFORMA and the ALA Association of Library Services to Children. This award is presented to a Latino/a writer and an illustrator whose work best portrays, affirms, and celebrates the Latino cultural experience in an outstanding work of literature for children and youth. Awards are given for narrative and illustrations, with honored books in each category. This award is named after Pura Belpré, the first Latina librarian of the New York Public Library. Belpré was a children's librarian who enriched the lives of Puerto Rican children in the United States through her storytelling, writing, and dissemination of Puerto Rican folklore.^[20] The Tomás Rivera Mexican American Children's Book Award was established in 1995 by the Southwest Texas State University to encourage authors, illustrators, and publishers to produce books that authentically reflect the lives of Mexican American children and young adults in the Southwestern regions of the United States.^[9] In 1993, the National Consortium of Latin American Studies Programs bestowed the first Américas Award for Children's and Young Adult Literature. The

Américas Award is given in recognition of U.S. works of fiction, poetry, folklore, or selected non-fiction published in the previous year in English or Spanish that authentically and engagingly portray Latin America, the Caribbean, or Latinos in the United States.^[20]

An additional program that has furthered attention to library and information services to Latino children has been the instituting of El Día de los Niños/El Día de los Libros (Children's Day/Book Day). This is a celebration of children, families, and reading held annually on April 30th. The celebration emphasizes the importance of literacy for children of all linguistic and cultural backgrounds. This event is the brainchild of nationally acclaimed children's book author Pat Mora, who proposed it in 1996. This national event has been funded by a series of grants from the W.K. Kellogg Foundation, and most recently Target. The Association for Library Service for Children continues to increase public awareness of the event in libraries throughout the country in collaboration with REFORMA, a founding partner of the event.

The demise of funding for school libraries throughout the United States, particularly in low-income communities has weakened the momentum of developing strong collections to meet the needs of Latino children. Other legislations like California's 1998 Proposition 227, which ended bilingual education and Proposition 187 in 1994, which denied undocumented immigrants social services, health care, and public education, furthered damaged the quality and quantity of services available to Latino children in public schools.

LATINOS AND ACADEMIC LIBRARIES

The development of collections and services to meet the needs of Latinos began in the academic setting. Precursors to what is known today as "Chicano collections" were Latin American and Southwest collections, such as the Genaro Garcia Library and the Eugene Barker Texas History collection at the University of Texas.^[3] Initiatives targeting the Latino student population had existed since the late 1960s, but the Ethnic Studies Heritage Act of 1972 provided funding for higher education institutions to increase their course offerings in ethnic studies.^[13] This led to a greater demand for Chicano/Latino studies collections and services. Often libraries were established as a result of student initiated efforts.^[21] The development of Chicano/Latino library collections within academia was difficult because this area of study was not perceived as a legitimate discipline by some institutions.^[1] The establishment of Chicano focused publishing houses, such as Quinto Sol, assisted in the production and availability of literature for and about the Latino community.^[2] Although challenging, the work of pioneering academic librarians such as Richard Chabran, Francisco Garcia, Lillian Castillo-Speed, Nelida Perez, and Margo Gutierrez, to name a

few, lead to what today are considered highly valuable Chicano/Latino primary source and reference collections and libraries.

The path towards instituting these special libraries was set by the Chicano Studies Library at the University of California, Berkeley and the Chicano Research Library at the University of California, Los Angeles, both established in 1969. In 1970, the Chicano Studies Collection, at Arizona State University, the Colección Chicano at California State University, San Diego and the Chicano Reference Library at Stanford University were soon after founded. Following the lead of these trailblazing institutions many universities across the United States introduced Chicano/Latino focused collections throughout the 1970s. For instance, the Centro de Estudios Puertorriqueños is an outstanding collection on the study and interpretation of the Puerto Rican experience in the United States. It was established in 1973 to support the Center for Puerto Rican Studies at the City University of New York.^[6] Other collections established during this decade were the Colección Tloque Nahuque, University of California, Santa Barbara, 1971; the Chicano Studies Collection, University of Texas, El Paso, 1971; the Mexico and Southwest Collection, California State University, Fullerton, 1972, now renamed the Chicana and Chicano Resource Center;^[1] the Mexican American Library Program, University of Texas, Austin, 1974; and the National Chicano Research Network, University of Michigan, 1977.

Similar to public libraries academic libraries also encountered a need for appropriate and relevant access tools. However the problem of indexing in academic libraries was more complicated. It was assumed that Latino students within higher education institutions were fluent English speakers so the rationale for special indexing system was harder to articulate. However, it was the development of Latino/Chicano Studies that required the organization of subjects according to proper concepts within the framework of the discipline.^[16] In early 1977, a pilot project to index 17 Chicano serial titles was coordinated by Richard Chabran along with Francisco Garcia and Roberto Trujillo. Nine libraries in four Southwestern states cooperated in the indexing project. During the development of this indexing scheme for Chicano serials the Committee for the Development of Subject Access to Chicano Literature was formed. In 1979, the Committee published the *Chicano Thesaurus for Indexing Chicano Materials*.^[15] It was the intention of the *Chicano Thesaurus* to provide more culturally sensitive and accurate descriptors than those from traditional controlled vocabularies. The *Thesaurus* used a combination of English, Spanish and Calo (slang) words or descriptors to approximate natural language.^[18]

Another early tool created to provide access to serials was the *Chicano Studies Library Serials Collection* of 1978. This work included citations for over 400 serials available in the Chicano Studies Library at the University

of California, Berkeley. This was the beginning of *The Chicano Periodical Index*. The early volumes of this index covered only Latino journals, while more recent ones cover periodical literature beyond Chicano/Latino Studies and other types of works such as books and poetry. In 1989 it changed its name to the *Chicano Index*.^[22] It eventually became available in machine readable format creating the *Chicano Database* and first released in 1990 on CD-ROM under the leadership of Lillian Castillo-Speed.^[18] In 1996 the database went online as an RLG product and in 2007 it became available via OCLC First Search. It is to date the only electronic research tool that focuses solely on indexing Chicano/Latino related materials and includes most of the small publications that came out during the late 1960s and 1970s.

Another significant access tool is the *Hispanic American Periodical Index* established in 1977 by Barbara Valk at the UCLA Latin American Institute.^[22] Although primarily an index of Latin American literature in more recent years it has included articles on the experience of Latinos in the United States. The *Spanish Speaking Mental Health Research Center Database* was established in 1975 and was the first searchable Latino focused database. This database ceased publication in 1990 and eventually its records became part of the *Chicano Database*.

LATINOS IN THE PROFESSION

The growth in collections and services for Latino library users created a need to prepare librarians to serve this community. The shortage of qualified librarians to serve this population can be attributed to both the small numbers of Latinos who enter the LIS profession and to the paucity of appropriate courses in library programs. The latest available statistical report of the Association of Library and Information Science Education (2004) stated that Latinos continue to be under represented in terms of earning a master's degree in Library Science. The report revealed that only 146 Latinos graduated with a master's degree in Library Science or in Information Science for the 2002–2003 academic year. This was from a total of 5762 graduates. Hence, Latinos continue to represent less than 3% of MLS degree recipients in the United States.

During the 1970s two programs were instituted to train qualified students to provide library services to Latinos. In 1968 Elizabeth Martinez, Jose Taylor, and David Barron formed a Los Angeles-based group called the Committee to Recruit Mexican American Librarians. A few years later in 1972 Patrick Sanchez worked with this group to establish the Mexican American Institute of Library Science at the California State University at Fullerton (1972–1975).^[13,14] This program was funded by the California State Library's Minority Recruitment and Advancement Program. This was the first time a library school program was aimed at training Latina/o librarians with specialized

course work and seminars and by providing financial aid to participants. The second program, established by Dr. Arnulfo Trejo, was the Tucson-based Graduate Library Institute for Spanish-Speaking Americans at the University of Arizona (1976–1979).^[23] These programs produced an impressive number of Latino librarians, many who went on to become leaders within the profession such as Martin Gomez, Luis Herrera, Salvador Güereña, Liz Rodríguez Miller, José Aponte, and Margo Gutiérrez. These programs were funded by soft money and ended after a few years. Although programs like these have not been reproduced, in 2001 the University of Arizona School of Information Resources and Library Science received an Institute of Museum and Library Services grant to create the Knowledge River Institute, a master's degree program to attract Native Americans and Latinos into the LIS field.^[13] Also, in 1997 the Spectrum Initiative, the brainchild of then ALA Director Elizabeth Martinez, was implemented to recruit applicants and award scholarships to minorities, including Latinos, for graduate programs in LIS.^[24]

The development of such recruitment efforts would not have been possible without the perseverance and dedication of many librarians who believed that services to the Latino community needed to be improved. The work of these individuals was often carried out via various national and local organizations. Some of the earliest of such organizations were the California-based Asociación de Bibliotecarios Chicanos, established in 1975 and Bibliotecas Para La Gente, established in 1978 in the San Francisco Bay area. The American Library Association established the Chicano Task Force of the Social Responsibilities Roundtable, and the Committee on Services to the Spanish-Speaking of the Reference and Adult Services Division.^[23] Many of the locally based organizations eventually became chapters of REFORMA, the first national association dedicated to the improvement of the full spectrum of library and information services for Spanish-speakers and Latinos in the United States.

REFORMA was established in 1971 by a group of Latino/a librarians at an ALA conference in Dallas, Texas. Leading the group were founding members Dr. Arnulfo Trejo and Elizabeth Martinez. Dr. Trejo served as president of the organization for the first 4 years.^[14] REFORMA was established to pursue the ideals of reforming libraries' lack of outreach to Spanish-speaking people, to create better library services to that community, and to recruit bilingual/bicultural librarians.^[12] At the time REFORMA was established it was called the National Association of Spanish-Speaking Librarians in the United States. It went on to change its subtitle to the National Association to Promote Library Services to the Spanish-Speaking and then to the National Association to Promote Library and Information Services to Latinos and Spanish Speaking in recognition that not all Latinos are Spanish speaking and not all Spanish speakers are Latinos. Over the years REFORMA has grown

to a national organization with 26 chapters located across the United States and Puerto Rico. Chapters function autonomously, working through their local library systems, state library associations, and local organizations to achieve local and national objectives.

In 1982 the REFORMA National Scholarship Program was instituted to be awarded annually to Latinos who are candidates for library school.^[14] In addition, many of the chapters have also established scholarships given to local LIS students who have demonstrated an interest in serving the Latino community. As an indicator of REFORMA's maturity it held its first national conference in Austin, Texas in August 1996, its second conference in Tucson, Arizona August 2000 and the third in El Paso, Texas September 2008. Although struggling during its initial years REFORMA has blossomed into a sophisticated and vital organization.

In addition to recruitment, professional development has also been an issue for serving the Latino community. In an effort to address this weakness, Dr. Arnulfo Trejo established the Trejo Foster Foundation for Hispanic Library Education (TFF) in 1992. The TFF has sponsored bi-annual, educational institutes to bring together leaders, practitioners, and students in the library and information fields to discuss and advocate for issues, policies, and practices that affect Latino communities. The Foundation provides support to finance research, seminars, workshops, and other activities that promoted and enhanced library education for Latinos. It is best known for its various educational institutes such as, the "Status of Hispanic Library and Information Services: A National Institute for Educational Change" (July 1993), "Latino Populations and the Public Library" (November 1995), "Hispanic Leadership in Libraries" (August 1997), "Library Services to Youth of Hispanic Heritage" (March 1999), "Bridging Borders: Building Hispanic Library Education in a Global Perspective" (July 2001), "Memoria, Voz, y Patrimonio: The First Conference on Latino/Hispanic Film, Print, and Sound Archives" (August 2003) and "Salud Se Puede: Health Information for Hispanic/Latino Populations" (July 2007).^[25] These institutes were funded through a variety of public and private sources as well as in partnership with other institutions.

CONCLUSION

The history of library services to the Latino community reveals advances in many areas. There have been vast improvements brought upon by the work of many dedicated individuals and organizations over the years. However, many of the issues that plagued librarians during the 1960s continue today. There is still a shortage of Latino librarians, a need for more curriculum development in library science programs to prepare future librarians to meet the needs of this community, and the need for more

collections that reflect the Latino community. Nevertheless, the accomplishments of the last few decades should be applauded and recognized.

Law Firm Librarianship

Brenda A. Burton

Mary B. Eggert

Clara C. Mosquera

Library, Kirkland & Ellis LLP, Chicago, IL, USA

Abstract

Law firm libraries differ from their municipal law library and academic law library counterparts in clients served, projects researched, and challenges faced. That law firms are profit-driven businesses influences the skills needed for a law firm librarian to succeed as well as how the library operates. As with all libraries, digitization continues to influence key aspects of law firm library practices.

INTRODUCTION

Law firm libraries vary from their law school library counterparts in that the stakes are much different at a law firm. Law firms are a business whose product is advice and counsel. Millions of dollars and hundreds of billable hours can ride upon discovering the missing piece of information or identifying the ideal expert who will help win a trial. Experienced law firm librarians work behind the scenes researching the facts and figures necessary for the attorney's practice and, ultimately, the client's success.

Law firm librarians provide these research services in the high-pressure environment that is a law firm. There are deadlines to meet for various trials, several corporate transactions taking place all at once, and additional nonresearch responsibilities to juggle, as well. A good law firm librarian has the ability and preparation necessary to meet these demands. Lawyers know the law, but law firm librarians support them with everything else. In many ways, the digital age has made research easier considering the vast amount of information now readily available online. However, analog skills are still necessary for a law firm librarian to perform well.

ORGANIZATION OF LAW FIRM LIBRARIES

Law firm libraries are organized in various ways depending on the size of the firm, the number of staff members, the number of offices, and the location of the offices. The libraries can range from having one solo librarian at a small firm to multiple librarians with a support staff at a large firm.

For firms with several offices, there can be a centralized library located in the firm's main office or library staff located within each office to provide onsite assistance. The staffing of a library in each office depends on the size

of that office and perceived need of support. For firms with international offices, the domestic library can support the needs of the foreign offices. However, because of differences in time zones and languages, many international offices will have their own libraries and librarians who can be consulted during their normal working hours.

Within a large law firm library, there can be a mixture of professional, paraprofessional, and administrative positions. Described here are the possible positions at a large law firm library and their corresponding responsibilities:

- **Library Director** (also called Library Manager, Information Manager, or Chief Librarian): The library director oversees the operation of the firm-wide library system and is in charge of vendor contract negotiations, annual budgets, long-range planning, and staffing. The library director also serves as the liaison to the firm's executive committee and typically reports to the executive director of the firm. At some firms, the library director is also in charge of the departments that handle knowledge management, competitive intelligence, records management, conflicts, and docketing.
- **Research Manager** (also called Assistant Library Director): Research managers usually head one of the individual offices. Their responsibilities include supervising the research librarians and administrative staff at their location as well as managing their own budget. They also oversee collection development including the selection of materials for acquisition and cancellation. Research managers often conduct research in addition to their administrative duties.
- **Research Librarian** (also called Research Specialist or Reference Librarian): Research librarians focus on conducting high-quality and cost-effective research for the attorneys, legal assistants, and support staff of the firm. They often have additional nonresearch responsibilities such as maintaining various library guides, evaluating new products, and providing training. Gen-

erally, the research librarian does not have any supervisory responsibilities.

- **Electronic Services Librarian:** Electronic services librarians are in charge of database and password management, library intranets, attorney training, and evaluation of new online services.
- **Embedded Librarian:** An embedded librarian works for a specific practice group. The librarian is usually situated on the same floor as the practice group, provides targeted research, and attends practice group meetings. This role is becoming more common in larger law firms.
- **Legislative/Regulatory Librarian:** Legislative/regulatory librarians research governmental materials and agencies and often compile legislative and regulatory histories.
- **Research Assistant:** Research assistants typically handle document retrieval and interlibrary loan requests. They can also assist the librarians with research projects.
- **Library Assistant** (also called Library Technician): A library assistant can have a variety of responsibilities, including placing book orders, routing periodicals, shelving books, processing invoices, filing loose-leaf materials, and retrieving books and articles from outside libraries.
- **Filer/Shelver:** Filers keep library materials up-to-date by filing loose-leaf supplements and pocket parts. They also reshelve books and periodicals. Many large law firm libraries outsource the filing services.
- **Cataloger** (also called Technical Services Librarian): Catalogers manage the cataloging and classification of library materials. They can also oversee the circulation system of the library. Many firms outsource the cataloging services.

For midsize law firms, there is often a library manager, a research librarian, and one or two library assistants. The library manager will handle the administrative tasks such as contract negotiations and budgets but will most likely do research as well. Smaller firms often have a solo librarian without any support staff. Working in a small law firm library can be a challenging position as the librarian handles all administrative responsibilities related to the library and its collection in addition to conducting research.

SERVICES AND USERS

A law firm library is a department of the law firm. As with other private business libraries, the law firm library focuses on the business of the firm it serves. That business is providing legal services to clients. The law firm library serves the information needs of both lawyers and staff. In a large law firm setting, there are both legal and

nonlegal staff. The legal staff consists of equity partners, junior or nonequity partners, and associates. The attorneys are supported by legal assistants or paralegals, project assistants, and case assistants.

A law firm's nonlegal staff includes the administrative personnel found in various departments such as accounting, human resources, and information technology. This is similar to any corporation. Departments that may be unique to a law firm include a business development department, conflicts department, and docketing department. Law firm librarians support the firm and all its departments by providing research, document retrieval, interlibrary loan, training, and maintenance of the library collection.

Research

Research librarians in a law firm library must provide research service in a cost-effective and timely manner. In many instances, the firm bills the client for the librarian's time and database charges.

Librarians have the ability to sort through a great deal of information, paring it down into a manageable amount, and ultimately providing only the most relevant documents to the requestor. They organize and summarize the results of their research. Research projects are usually wide-ranging and cover a variety of topics. The research librarian must be adept at switching gears because no two requests are quite the same. A typical day may have a law librarian doing background research on an expert witness, identifying intellectual property owned by a company for due diligence purposes, and finding Securities and Exchange Commission company filings precedent. Many projects are deadline sensitive in a law firm, and a librarian is often called upon to juggle multiple research projects at a time. It is usually a fast-paced work environment.

Examples of research projects in a law firm library include:

- Assembling a dossier on a particular company including biographical information on officers and directors, a listing of recent acquisitions or divestitures, major news stories, and stock quotes
- Cite checking a case to determine whether it is still "good law"
- Compiling a legislative history to discover the intent of specific law
- Creating media alerts to monitor current business of a client
- Determining state of incorporation and principal place of business for companies
- Identifying statutes or administrative agency regulations
- Looking for secondary source materials, such as legal treatises, law review, or bar journals

- Obtaining background on expert witnesses (biographical information, media, publications, and prior testimony) or identifying potential experts in a particular academic field
- Identifying all the intellectual property (copyrights, domain names, patents, and trademarks) owned by a company
- Searching for particular language in company Securities and Exchange Commission filings (e.g., how they disclose to investors that they are subject to pending litigation)
- Finding information to assist the business development department in preparing a bid for work from a new or existing client
- Assisting the conflicts department in determining whether an existing client may be on the other side of a legal matter
- Identifying case information for a lawsuit to aid the docketing department in obtaining pleadings from the court
- Researching the background of potential new vendors for the IT department

Research Desk/Triage System

A large law firm may have multiple research librarians who work on research and document requests. The workflow may be managed through a centralized research intake or triage system. The librarian managing the research desk assigns the projects, while keeping in mind deadlines and cost constraints. Reference interviews are conducted to determine the best and most cost-efficient manner to conduct the research. Good communication skills come into play as the librarian negotiates deadlines, discusses parameters of the research, and provides cost estimates. Other firms may use a decentralized or less formal intake system.

In addition to taking and assigning incoming research and document requests, the librarian also receives questions from patrons wishing to conduct their own research. The librarian will make suggestions on which sources the patron should consult and in what format.

Document Retrieval and Interlibrary Loan

The library can obtain copies of articles, patents and patent file histories, technical papers, dissertations, standards, and conference proceedings. Although technology and the Internet have made many documents, especially those from government agencies, readily available electronically, there is still a need for materials not online or owned by the law firm library. Firm librarians work with university, public, government, and other law firm libraries to obtain documents as well as legal and nonlegal books. Interlibrary loan in law firms is often done by e-mail and

telephone as many requests must be filled quickly, often within hours.

Firm Intranet and Knowledge Management Systems

The library contributes to the firm intranet by maintaining a library services page. Attorneys and staff may access the library catalog, sign up to receive newsletters, and obtain pathfinders or library guides for particular areas of law. These pathfinders may address current developments or link to primary law materials, online treatises, and periodicals.

Law librarians often are advisors in creating the firm's knowledge management system. They create the organizational taxonomy of terms used in such systems allowing the attorney to search for internal work product and drafting tools for both litigation and transactional documents.

Training and Orientation

Law librarians provide library orientation for new associates as well as attorneys hired from other firms, known as lateral hires. They introduce the new attorneys to the firm's library and its services, focusing on the attorney's specific practice area. These sessions are often done one-on-one.

Newly admitted attorneys coming from law school are comfortable in the new digital era, but may not be aware of all the databases and sources the library can offer them. Lateral hires might want to be assured that they will have access to a source that they had at their prior firm. If the library does not currently own the resource, the librarian may offer alternatives. Orientation is a good time to let new hires know what the library can offer and to remind them of the informal yet practical "Google Rule" where if they are looking for something on the web or some other source and cannot find it after 10 minutes, they should contact the library. The librarians often have access to additional resources and can locate information in the quickest and most cost-effective manner.

Maintenance of Collection and Library Catalog

The library maintains an electronic catalog of its materials. In turn, the technical services or library operations staff manages the catalog. They are responsible for serials check-in, routing, and processing of new materials. The library routes a variety of print and electronic periodicals to support the firm's business and practice areas. Increasingly, current awareness is electronic-only via e-newsletters, RSS feeds, or e-zines that are pushed to the desktop or mobile device.

In today's environment, librarians must develop and maintain library collections keeping in mind not only what the best resources are, but also the optimal format for their users in this hybrid era of print and digital materials. Electronic subscriptions often involve license negotiation,

determining whether a separate per user license will be needed or whether the firm will have IP authentication. Librarians also monitor billing and passwords/logins for each resource.

COLLECTIONS

For the most part, the digital age has made for an ever-shrinking library footprint. The traditional image of a law firm library with rows and rows of reporters, statute volumes, and treatises has evolved into the modern, digital universe with the same information only a keystroke, mouse-click, or touch-screen away. Some law firms have almost completely eliminated paper collections while others still have books, but fewer and fewer of them each year.

Current federal and state statutes, regulations, and case reporters are available via services such as Lexis-Nexis, Westlaw, and Bloomberg Law. These are the same materials that formerly occupied the most space in a law firm library. These vendors and others such as HeinOnline also provide access to collections of law reviews, law journals, newspapers, trade journals, etc.

Some items still found on library shelves are current awareness materials such as newspapers and journals. There are also specialized dictionaries (medical, scientific, technical) and practice guides meant to bring an attorney up to speed on the topic in question. However, many of these books and periodicals are also converting to digital media via the migration to e-books and online subscriptions.

Searching these materials online is more time- and space-efficient than hunting through indexes and bookshelves. However, many online services are moving from command language and Boolean searching to more nebulous, search engine type searching, or what can be described as changing from searching to browsing.^[1]

While the accessibility of current materials is essential for a law practice, historical materials are also extremely important when researching precedent or legal intent. The extent to which historical materials are available online varies. This is where interlibrary loan comes in. Law school libraries at research institutions will have deep collections of historical materials unavailable digitally.

EDUCATION

Law firm librarians can have JDs or MBAs, but ideally have a master's degree in library science (MLS). A library science degree provides librarians with not only research skills, but more importantly the ability to interact with patrons who range from the highest ranking equity partners to case assistants. Knowing how to conduct a reference interview—identifying intent and pinning down what information the requestor truly needs—is an essential aspect of performing well in a law firm setting.

Depending on the practice areas or size of the firm, other areas of knowledge are useful. A science or technical background will be prized in an intellectual property practice. A background in finance is advantageous when working with a private equity/venture capital practice. Foreign languages are helpful at international firms with offices throughout the world. Because research projects are wide-ranging and diverse, the more knowledge and intellectual curiosity the law librarian has, the better.

PROFESSIONAL ASSOCIATIONS

There are several associations for librarians that support professional development at national, international, or local levels. The American Association of Law Libraries (AALL), the Special Libraries Association (SLA), and Strategic and Competitive Intelligence Professionals (SCIP) are the most relevant to law firm librarians. These organizations are useful not only for networking purposes, but also to keep up with best practices in research, to keep abreast of trends affecting libraries, and not least, to advocate for librarians.

Like other professional organizations, they publish trade journals, track membership, disseminate information via social media, and lobby government. Members gather at annual or semiannual meetings for workshops and seminars on topics such as copyright issues in libraries, technical services, or digital collections. They are essential for continued professional development.

TWENTY-FIRST CENTURY CHALLENGES

In the last 25 years, the law firm librarian profession has undergone dramatic changes primarily as a result of the rise of the Internet and a shift from a reliance on print resources to an ever-growing dependence on electronic resources. This trend will persist and will present numerous challenges to law firm librarians as well as librarians in academic, public, and special libraries.

One of the biggest challenges facing all librarians is how to best manage their library collections, which consist of both print and electronic resources. As more titles are made available in electronic formats, librarians have to decide which format best serves their attorneys. In some instances, the decision is made to obtain both the print and electronic versions of materials, but this can be expensive as a result of legal publishers bundling the print and electronic products together at a high cost. According to the 2015 AALL Biennial Salary Survey & Organizational Characteristics, law firms spend an average of 69.2% of their information budget on electronic resources.^[2] While that percentage is already high, it will likely continue to rise in the near future as publishers offer less print material in favor of electronic resources.

Electronic resources pose their own challenges. While electronic databases provide users with the ability to do sophisticated searching of full-text materials, each product has its own platform and search syntax. Not only do librarians have to become experts in using each product, they have to be able to instruct the attorneys in how to best use the databases. Another challenge is determining whether the library should obtain an enterprise license or individual seat licenses for the electronic resource. Fortunately, there are electronic resource management tools that allow the library to track usage of databases to determine if there is sufficient use of the electronic databases to justify their costs.

The realm of e-books is also proving to be a challenge. More and more attorneys are asking for e-books that they can read on their mobile devices, tablets, e-readers, and desktop computers. There are some publishers providing access to e-book collections through subscriptions, but there are also ways to buy an individual e-book directly from a publisher. Unlike print books, once an e-book is purchased, it can be difficult to circulate to the end user due to license restrictions. E-books will continue to become more prevalent in the years ahead as librarians determine the best way to implement this technology.

Another challenge arising from the increase in electronic resources relates to attorney training. Law firms have attorneys with varying levels of comfort with technology. Training sessions have to be customized to accommodate differing degrees of skill. Many databases are being redesigned to be more Google-like in their search functionality, although this brings its own challenges for librarians and attorneys adept at doing more sophisticated searching.

Compliance with copyright laws has always been a challenge in the library world, and the increasing use of electronic resources has only magnified this issue. Many databases have strict license agreements for their electronic materials. The librarian is often asked to obtain an electronic copy of an article, standard, or book on behalf of an attorney. It is the librarian's responsibility to make sure that the license agreement is not violated once the material is shared with the attorney. However, once the item has been given to the attorney, it is difficult for the librarian to keep track of how the document is being used and/or distributed. Many law firms have document management systems that are designed to share materials internally. These document management systems can be especially problematic in terms of copyright compliance as users can unwittingly post copyrighted materials.

In addition, obtaining materials through interlibrary loan is becoming more difficult as libraries are replacing print materials with electronic versions. The license agreements for these electronic resources prohibit the lending library from sharing the materials with people outside of their organization. As a result, libraries will be limited in what they can share with other libraries, which will make it harder for libraries to obtain articles and books through traditional interlibrary loan methods.

Budgeting is a perpetual challenge for libraries including law firm libraries. The rise of electronic resources and the unpredictable nature of their costs have made it progressively more difficult to plan an annual budget and to stay within the budget from year to year. In addition, cost recovery in law firm libraries is becoming more problematic. According to the 2016 ALM Law Librarian Survey, 71% of the Am Law 200 firms reported recovering 40% or less of their online research costs.^[3] A growing number of firms are beginning to consider database costs as overhead and are no longer attempting to recoup those expenses from clients.

Another challenge relates to outsourcing. Some library services, such as filing of loose-leaf treatises and cataloging, are often outsourced. However, the concern is that research services could also be outsourced. While this type of outsourcing has not yet spread throughout the law firm community, the threat is still an ongoing consideration.

CONCLUSION

Whether working in a small, midsize, or large law firm, the law firm librarian's main responsibility is to support the research needs of the firm's attorneys, legal assistants, and administrative staff. The librarian's knowledge of a wide variety of resources, both print and electronic, and ability to produce quality research in a timely and cost-effective way is a valuable asset to the firm. The library often cooperates with the other departments in the firm including the business development, information technology, conflicts, human resources, and accounting departments. These collaborations with the administrative and legal staff help the library maintain its status as a highly regarded and much used department in the firm.

Even though the law firm librarian profession is undergoing significant changes and is facing numerous challenges, it continues to be a dynamic and fulfilling career. The demanding deadlines and the stimulating research projects give law firm librarians a unique work environment not typically found in other types of libraries. It is important that law firm librarians strive to demonstrate to the attorneys and executive committees at their firms that the library is a vital contributor to the overall success of the firm. By doing this, law firm librarians can ensure the continued longevity of this type of librarianship.

Abstract

This entry presents a current picture of law librarianship in the United States, with some international coverage, through discussion of three major types of law libraries: those supporting legal education, law firms, and the public. The primary mission of the law school library is to meet the information needs of the faculty and students of the institution it supports. Beyond support for the core functions of legal education and research, the specific missions of law school libraries vary depending on the size and missions of law schools of different types. Law firm libraries combine the atmosphere of research with the stimulations of big business. Law firm librarians help lawyers clarify and refine their research projects and provide timely and cost-effective solutions for those projects. The term “public law library” refers to all law libraries that are not affiliated with either law firms or law schools. In this category are found county public law libraries, court libraries, state law libraries, state and federal agency law libraries, and bar association and subscription law libraries.

INTRODUCTION

Law librarians work in various legal settings, including law schools, private law firms, and public law libraries of a variety of types. The profession is bound together by law librarians’ expertise in working with legal materials, and for many law librarians by their work in direct support of legal professionals or students training to become lawyers. Many law librarians, especially in law school libraries, hold graduate degrees in law as well as in library science; some have graduated from library schools with specialized programs in law librarianship.

Law is a profession that is heavily dependent on ready access to the current texts of primary source legal materials—statutes, court decisions, and administrative regulations and decisions—issued by a variety of law-making authorities. The job of the law librarian has always been to obtain and organize the primary source materials, as well as published commentary on the law, and the indexes and other finding tools needed to use them. Because the primary sources of law have long been available in full-text electronic formats, law librarians are also highly skilled in working with electronic sources and in choosing appropriate information formats to meet the needs of users at specific types of libraries. This entry discusses the practice of law librarianship in three major types of law libraries: law school or academic law libraries; law firm or private law libraries; and public law libraries, which include court libraries, state law libraries, state and

federal agency law libraries, bar association and subscription law libraries, and other libraries open to the public.

LAW SCHOOL LIBRARIES

Introduction

The primary mission of the law school library is to meet the information needs of the faculty and students of the institution it supports. In addition to their role in educating future lawyers, law schools are the major producers of scholarly literature in law and rely on academic law libraries to provide the resources and support needed for research and publication. Beyond support for the core functions of legal education and research, the specific missions of law school libraries vary depending on the size and missions of law schools of different types. Differences among law schools result in differences among their libraries in collection size and composition, staffing and services offered, and additional clienteles served. In the United States, libraries at publicly supported law schools are likely to provide a fuller range of services to local or state attorneys than are libraries at privately funded law schools, while libraries at urban law schools are more likely than others to provide services to the general public. The range of services an academic law library provides to others than its own students and faculty depends also on its proximity to law firm libraries or public law libraries,

established to meet the needs of firms, courts, practicing attorneys, or the public. The presence of large numbers of a law school's own graduates in the area also normally results in greater library services for the local bar.

Organization and Administration

In the United States, the professional degree in law, the Juris Doctor, is attained after three years of study and training beyond the baccalaureate degree. Lawyers are educated in separate schools or colleges within the university, rather than in departments of graduate schools or other units. Law schools are normally housed in their own physical facilities and a law school's control over its physical plant is among the factors considered by the American Bar Association (ABA) in its accreditation processes.^[1]

These factors, in addition to the specialized nature of legal collections, have contributed to U.S. law school libraries' traditional administrative autonomy from the larger library systems at their universities.^[2,3] Only a handful of the libraries at the nearly 200 law schools accredited by the ABA are administered directly through their university library systems. The ABA standards require that the law library have sufficient autonomy to direct the growth and development of the library collections and that the dean of the law school and the library director determine law library policies in consultation with the faculty.^[1] In practice, therefore, the budgets of most academic law libraries are administered as part of the law school's budget rather than as part of the overall budget of the university library. If the law library budget must be justified to a higher authority than the law school dean, it is typically the dean or the dean and law library director together who defend the budget at the university level. Similarly, the law library director normally hires and supervises law library staff without involvement by the university library and is responsible for all typical library operations and services, including selection, ordering, cataloging, and processing of library materials.

Although there are a number of variations in internal administrative structure among law school libraries, most U.S. law school libraries are organized traditionally in some form of division between technical and public services, with an administrative unit, often consisting of the law library director, an associate director, and administrative staff to provide support for the library's operations.^[4] Variations on the basic organizational model depend on the size of the law school, the number of library staff, and the ratio of professional librarians to support staff members. Increasingly, organizational structures also depend on the role played by the library in supporting the law school's use of information technology and other media. Some law schools place significant overall responsibility for technology within the library's jurisdiction; others

maintain separate units for law school technology, which may support the specialized needs of the library as well.^[5]

As a practical matter, the traditional autonomous administration of academic law libraries at U.S. universities is affected by a number of factors, including the widespread implementation of university-wide library information systems, and the need to develop new structures to share costs and access to common databases and other forms of networked information on university campuses.^[6] As space tightens, law libraries also increasingly share remote storage facilities for less-used materials with other campus libraries. Law librarians at some universities are included in the shared ranking and job security systems for librarians at all campus libraries. As the forms of legal publication move from print to electronic formats, requiring less in the way of manual filing and other labor-intensive means to be kept current, some of the long-standing justifications for separate law library processing staffs are called into question.

In a number of countries outside the United States, law is taught as an undergraduate subject, and law libraries are likely to be less autonomous than in the United States. In the United Kingdom, for example, only about a third of law library collections are housed in locations separate from collections in other subjects, and the law faculty typically does not have direct control over budget and policy.^[7]

History and Development

The history of academic law libraries is closely tied to the history of the development of formal legal education within the university setting. In the United States, the College of William and Mary lays claim to founding of the first professorship in law and the beginnings of a small collection of law books within the confines of the college library in 1779.^[8] The Harvard Law Library, now the largest academic law library in the United States, was established in 1817. Yet, until the primary locus for legal education moved in the late nineteenth century to the university from the law office, where aspiring lawyers clerked and read the law under the tutelage of established practitioners, few law school libraries (other than Harvard's) compared in size and breadth of collections with bar association libraries or membership libraries developed to meet the needs of the practicing bar.^[9,10]

With the changes in legal education that followed the appointment of Christopher C. Langdell (a former student librarian) as dean of the Harvard Law School in 1870, the perceived role and importance of the academic law library changed significantly. Under Langdell's case method of instruction (which was adopted at law schools throughout the United States), reading, analysis, and application of the law found in selected court opinions became the focus of the law school classroom, and the books containing the opinions took on new prominence as the sources of legal

knowledge.^[11] Langdell's focus on the importance of the judge-made law in published cases may have initially limited the breadth of academic law library collections, but in the twentieth century the importance of other sources of domestic, foreign, and international legal authority (statutes, administrative regulations and rulings, treaties, and other international agreements) broadened the scope of the law library's collections of primary source research materials. The entry of commercial publishers such as the West Publishing Company into the legal publishing market increased the amount of primary source material available for lawyers to use and for law libraries to collect, as well as the variety of finding tools needed to enable lawyers and other researchers to locate sources of legal authority and to evaluate their usefulness. The solidification of the university law school's role in educating lawyers also contributed to an expansion of the secondary literature in law. Spurred by the establishment of the *Harvard Law Review* in 1887, law professors and law students began writing and editing articles for publication in reviews and journals typically published at the law schools themselves. Although initially consisting primarily of doctrinal articles aimed in large part at the needs of practicing lawyers, the early law reviews became the locus of the most important scholarly literature in law, which would grow to be a significant component of academic law library collections. The increasingly scholarly emphasis of law school faculty writing (in journals, monographs, and treatises) also led to pressures on law school libraries to collect domestic materials beyond the strictly legal and to make at least selective forays into collecting materials of foreign jurisdictions.

The history of academic law libraries in the twentieth century was characterized by: growth in numbers of law schools (and law libraries) as the value of a legal education was seen to extend beyond traditional legal practice; the challenges posed in collecting and preserving growing amounts of primary source materials; the expansion of the scope of collections to include nonlegal materials; the effects of globalization on the need for access to foreign and international legal materials, and staff skilled in using them; the dramatic impacts of information technology on collections and services in the last quarter of the century; and the development of academic law librarianship as a professional specialty. These and other topics are treated briefly in the following sections of this entry and more exhaustively in the literature of the field. In addition, articles about the history and development of individual law school libraries can be found in the journals of law librarianship, which are noted below.

Standards and Statistics

The collections and services offered by the modern academic library, as well as other aspects of its operation, are influenced by the standards developed by legal education's external accrediting bodies and other

agencies. In the United States, nearly 200 law schools are accredited by the ABA through its Section of Legal Education and Admissions to the Bar. In nearly all states, graduation from an ABA-approved law school is a prerequisite for taking the bar examination and qualifying for a license to practice law. As part of its approval and ongoing review processes, the ABA promulgates standards for law school libraries and gathers extensive statistical data about libraries at approved schools. The law library standards speak to such matters as administrative structures, personnel and services, and collections.^[1] Each approved law school (and its library) is visited and reevaluated at seven-year intervals. Library data from the ABA's annual questionnaires for law schools are compiled annually into comparative tables and made available to law school deans and library directors. Although distribution of the compiled questionnaire data is limited, some data appear in the annual *ABA/LSAC Official Guide to ABA—Approved Law Schools*.^[12] Selected comparative data about law school libraries also appear in unofficial guides to law schools^[13,14] and are available from 1998–1999 to date through the Association of Research Libraries.^[15] Comparative data from the ABA questionnaires for the years 1969–1993 can be found in the 1970–1994 annual volumes of *Law Library Journal*.

The Association of American Law Schools (AALS) is a membership organization for law schools, which promulgates standards in the forms of bylaws and associated regulations for its members' libraries. The AALS library regulations are similar in coverage to the ABA standards.^[16] The AALS reviews its member schools in conjunction with reaccreditation visits by the ABA. Standards for university law libraries in the United Kingdom have been promulgated by the Society of Legal Scholars.^[17]

Law School Library Collections

The core collections of all law school libraries include the primary sources of legal authority produced by the major branches of government: reported court opinions (or cases), statutes enacted by legislatures, and executive or administrative materials (regulations and quasijudicial rulings). Academic law libraries in the United States typically include comprehensive collections of primary materials from the federal government and from each of the 50 states in print or electronic formats. Although the states each have their own legal systems, each is a "common law" legal system in which much of the law has developed historically through judicial decisions and written opinions. Under the common law, decisions from courts outside the jurisdiction where a case is being heard will not control the results in the case but can be cited and used as the basis for lawyers' arguments, and can influence the court's decision. As a result, U.S. law school libraries often collect materials from common law jurisdictions outside the United States, such as England, Canada, and

Australia, even if they do not generally collect foreign law materials. Because controlling judicial precedents for a current case may be found in cases as old as the jurisdiction itself, law school library collections of primary source materials are usually deep in their coverage, as well as broad.

Reported decisions, as well as legislation and administrative law materials (each of which grew in importance during the twentieth century) provide the raw materials for legal research and make the law library into the lawyer's laboratory that Dean Langdell emphasized at Harvard.^[18] Finding the law applicable to a research problem, however, becomes increasingly difficult as the body of potential useful material grows in volume and complexity. In addition to primary materials, therefore, law library collections include large holdings of secondary materials—treatises, journals, encyclopedias, and a number of specialized publications written to guide the researcher through the law on a topic, as well as indexes, digests, and other more typical finding tools. Some secondary sources are designed primarily for practicing lawyers and serve to organize and provide access to the body of primary authorities on a topic, providing little in the way of detailed analysis or evaluation; others, including the journal articles and monographs produced by law professors and other legal scholars are more analytical, critical, and prescriptive in their approaches.

Because the legal researcher usually needs to have the most up-to-date version of the law, as well as to be certain that an apparently applicable case has not been overturned by a higher court, or that a statute has not been amended, repealed, or found to be unconstitutional, legal publications rely on a variety of means for regular supplementation and updating. Historically, new court opinions and statutes have been published as quickly as possible in pamphlets that are eventually compiled into bound volumes. Some materials have been published in loose-leaf formats so that pages with new information could be easily added as those with older information were replaced and discarded; other sets that require less frequent updating may provide supplemental materials in "pocket parts" inserted inside the back covers of the volumes. Although the bodies with the authority to make law (courts, legislatures, and agencies) have themselves published the materials they issue in official versions, official publication has always been slow and usually lacking in sophisticated finding tools. Beginning at least in the late 1800s, commercial publishers in the United States competed for lawyers' (and law libraries') dollars with their own versions of primary source materials, which were likely to be published before the official versions and linked to the publisher's own finding tools and other products. As a result, academic law libraries have typically offered several commercially published versions of court reports and other important publications, as well as the official versions. Most U.S. law school libraries also

have depository status for federal documents and maintain substantial selective collections of government documents, some of which also are duplicated in commercial publications.^[19]

While the common image of a large library reading room surrounded by rows of book stacks packed with neatly arranged volumes is still accurate for most law school libraries, the impact of electronic databases and the Internet on legal research and the law library has transformed the ways in which lawyers and law students conduct research. As one observer noted in 2007: "The debate about whether print or electronic resources are better for legal research ended essentially because the consumers of the resources made a decision. . . . Faculty, attorneys, and law students voted with their feet, and their feet led them to the computer terminal."^[20] The advantages of full-text electronic access to the materials of law for research are apparent, and large databases of primary source materials have long been commercially available to lawyers and law.^[21] The potential size of the law market created significant competition between the two major database suppliers, which led to rapid expansion of the databases to the point where retrospective coverage of important U.S. primary sources is essentially complete. The major database vendors have also viewed law schools as important areas of competition for future users of their services, and have generally provided low-cost access to the databases for law school faculty and students, as well as training in the use of the products for research. The two major databases, LexisNexis and Westlaw, now provide law students and faculty 24 hr access using personal equipment within the law school building or from home. In addition, the World Wide Web has increased the direct availability of primary source U.S. legal materials over the Internet, both through new Web-based commercial services, on official sites offered by courts and government agencies, and through open access sites, such as Cornell Law School's Legal Information Institute.^[22]

The growth in sources for accessible online legal information first allowed many law school libraries to reduce their holdings of duplicate copies of court reports and other heavily used sets of primary source materials in their print collections. Secondary legal materials, including large retrospective journal and treatise collections, and finding tools are also available in electronic formats, leaving law school librarians with ongoing decisions about choices of appropriate formats for their user communities and whether to bear the costs of providing information in multiple formats.^[23]

As increasing accessibility of legal information in networked electronic formats continues to make local availability of large print collections less important to legal researchers, the distinctiveness of individual academic law library collections is increasingly dependent on their current and retrospective collections of secondary sources and foreign law materials.^[24,25] Collection

development in academic law libraries is normally based on a written plan, required by the ABA^[1] that must take into account the importance of electronic formats, the needs of faculty researchers for specialized nonlegal materials, the extent to which the library serves constituencies beyond its own faculty and students, and the library's proximity to and ongoing relationships with other libraries on its campus and beyond.^[26,27] Academic law libraries' interests in cooperative collection development have been major factors in the development of regional consortia of law libraries.^[28]

Historically, major foreign and international law collections were developed only at the largest academic law libraries and were supported by lawyer-librarians who immigrated to the United States from foreign countries.^[29] During the latter half of the twentieth century, U.S. legal scholars' increased interest in foreign and international law and the law schools' efforts to recruit visiting scholars and students from outside the United States led a broader range of law schools to devote significant resources to their foreign and international law collections. As interest in foreign and international law expanded, academic law libraries faced major challenges finding qualified staff to manage and support growing collections, and obtaining the financial resources to develop and maintain them.^[30-32] In foreign and international law, as for domestic law, academic law librarians produced major bibliographic works and research texts to support the efforts of scholars.^[33,34] To support research in foreign law, the American Association of Law Libraries (AALL) publishes the *Index to Foreign Legal Periodicals* (1960-). Greater access to legal information worldwide on the Internet has also been enhanced by the Free Access to Law Movement and the activities of legal information institutes throughout the world collaborating through the World Legal Information Institute (WorldLII).^[35,36]

Many academic libraries maintain at least small rare books collections both to support research and to demonstrate the importance of the historical record to the development of the law. Morris L. Cohen is the major figure in American rare law books librarianship and is the author of the *Bibliography of Early American Law*^[37] and other works in the field.^[38,39] In most law school library collections, materials old enough to suggest their classification as rare books are shelved in open stacks, leading to academic law librarians' ongoing concerns with preservation of print materials.^[40] As more primary legal research materials are issued primarily or exclusively in electronic formats, academic law libraries have been challenged to define their roles in both preserving and authenticating digital legal information.^[41,42]

Because many of the core primary source materials of the law library (court reports, volumes of statutes, journals, etc.) have been published as serials, and are to some extent self-organizing by numbered volume and date, organization by subject classification was a relatively

late development for law library collections. Subject organization became increasingly important with the growth of a significant secondary literature for law and the growing need to organize foreign and international legal materials. The first fully developed Library of Congress (LC) schedule for legal materials (KF for U.S. law) was published in 1969. Since that time, schedules have been completed for all foreign jurisdictions and international law. While many academic law libraries still do not classify all U.S. primary source materials, most use the LC schedules to organize their treatise and monograph collections, and collections in foreign law.^[43] Because of the need for frequent supplementation and updating, as well as the nature of the materials themselves, primary sources, finding tools, and many secondary sources are noncirculating in most academic law libraries. The need for ready access to information housed in large, complicated collections makes sophisticated collection management systems essential to the successful operation of the academic law library.

Law School Librarians

Nearly all academic law librarians in the United States hold master's degrees in library or information sciences; reference librarians and administrators typically hold law degrees in addition to their credentials in librarianship. The ABA standards for law schools and the membership requirements of the AALS state that the law library director should have both law and library degrees, and the ABA standards require that the director hold an appointment on the law school faculty.^[1,16] Depending on practices at individual law schools and, in part, on whether they teach in the law school, other law librarians may also have some kind of faculty status.^[44]

Within the law school curriculum, law-trained librarians typically provide formal or informal instruction in legal research techniques and the literature of the law. Legal research courses take a variety of forms: most programs focus on introducing the sources of law and legal research to first-year law students; some law schools offer advanced legal research courses in either United States or foreign and international law as electives in the upper-class curriculum.^[45] Law school librarians have also figured prominently in the writing of the standard legal research textbooks, a number of which have gone through several editions.^[46-49] A listing of the major law librarian textbook writers—Robert C. Berring, Harry Bitner, Morris Cohen, Frederick C. Hicks, J. Myron Jacobstein, Roy M. Mersky, Miles O. Price, and William R. Roalfe—serves as well as a list of some of the major figures in modern academic law librarianship in the United States.

In part because of law library directors' usual status as members of law school faculties, academic law librarians as a group have been major contributors to the professional and scholarly literature of law librarianship.^[50] Most of that literature is published in such specialized

journals as *Law Library Journal* (1908–) and *Legal References Services Quarterly* (1981–) in the United States; *Legal Information Management* (1970–) and *Australian Law Librarian* (1993–); *Canadian Law Library Review/Revue canadienne des bibliothèques de droit* (1970–) published abroad; and the *International Journal of Legal Information* (1973–), as well as in publications sponsored by the AALL and other law library organizations outside the United States. Some law library literature is published in more general journals of library and information science; and some is also published in scholarly journals of law, bar association journals, or other specialized legal periodicals. *Legal Information & Technology Abstracts* is a Web journal providing access to legal information scholarship.^[51]

The importance of the law degree as a credential, the faculty status accorded to academic law library directors and other librarians, and the tendency to write for legal audiences all provide evidence of the strength and durability of the academic law librarian's connections with the legal profession. The history of the development of academic law librarianship in the twentieth century indicates that, through the 1950s, many head librarians at U.S. law schools did not hold library degrees and those who did have both law and library degrees thought of themselves primarily as lawyers and then as librarians. Because of the positions of influence that academic law librarians have traditionally held within the profession, it is possible that the emphasis on "law" in law librarianship hindered the overall development of law librarianship as a profession.^[10,52] As noted above, however, the law school accreditation standards now emphasize the desirability for library directors to hold both degrees and the need for qualified staff in all positions; there are now few directors who do not hold advanced degrees in law and librarianship, and few law librarians who are not professionally educated in library and information science.

A number of U.S. schools of library and information science offer specialized courses for prospective law librarians in legal research, law library administration, and information policy. In recognition of the need for specialized law library training within the context of graduate education in librarianship, the AALL has established Guidelines for Graduate Programs in Law Librarianship^[53] and maintains an online list of accredited graduate programs in library science that offer law library courses.^[54] The University of Washington Information School has offered a specialized program in law librarianship since 1939.^[55]

Like librarianship generally, both law librarianship and the academic law library specialty are overwhelmingly female in composition. Studies of the role and status of women in the profession have noted historical disparities in salaries between male and female law librarians, as well as the disproportionate numbers of males in academic library directorships.^[56,57] Some studies have indicated a

continuing trend toward gender balance between males and females in academic law library directorships but not a distribution proportionate to the numbers of women working in academic law libraries.^[58,59]

Professional Associations

The primary professional association for U.S. law librarians is the AALL, which was founded in 1906 at the annual meeting of the American Library Association.^[60–63] American Association of Law Libraries' stated purpose is to promote and enhance the value of law libraries to the legal and public communities, to foster the profession of law librarianship, and to provide leadership in the field of legal information. Its current membership of over 5000 includes law librarians and related professionals affiliated with law firms, corporate legal departments, courts, and government agencies, as well as with law schools.^[64,65] The AALL provides law librarians opportunities for professional development through its annual meeting programs, educational workshops, and institutes; provides scholarships and grants for members requiring assistance to further their formal education or to attend AALL educational programs; supports an active publications program; and provides placement services.

Throughout its history, AALL and its members have been involved in public policy activities, focusing on issues of national information policy, copyright, and public access to legal information.^[66] Since 1990, the association's Government Relations Office has monitored legislative, judicial, and regulatory activities, and represents the views of AALL through congressional testimony and legal briefs, frequently working in concert with other library associations and information policy groups.

Since 1976, AALL has encouraged the creation of special interest sections (SISs), organized by subject matter or professional specialty (e.g., foreign, comparative and international law, technical services), or by type of library. The Academic Law Libraries SIS was established in 1979 and serves as an umbrella organization for all law school librarians, sponsoring educational programs, providing discussion forums and workshops for directors and middle managers, and publishing a newsletter. The AALL also has a number of local and regional chapters in which academic law librarians are active participants.^[67]

Academic law librarians have played significant roles in the development and activities of AALL. Over half of AALL's presidents were affiliated with law school libraries at the time they served, and all of the major figures in academic law librarianship in the United States have been heavily involved in AALL activities. Many prominent and historically significant academic law librarians have been profiled in AALL publications.^[68–73] Biographical information about academic law librarians can also be found in occasional directories published by AALL;^[74] information about academic law library directors can be found in

the annual *Directory of Law Teachers* published by the AALS.^[75] Memorials for deceased law librarians, which normally include biographical information and personal reminiscences, are published in *Law Library Journal*,^[76,77] as well as in the publications of other law library organizations.

The International Association of Law Libraries (IALL)^[78] was founded in 1959 through the efforts of a special committee of the AALL led by former AALL president William R. Roalfe, who became IALL's first president. Since its founding, IALL has provided a significant focus of professional activity for academic law librarians interested in substantive areas of international and comparative law and research, and a forum for cooperation among academic law schools and their libraries.^[79,80] The IALL publishes the *International Journal of Legal Information* and sponsors annual educational conferences.

U.S. academic law librarians are also active in national legal organizations. The AALS includes a section on law libraries and maintains a standing committee on libraries and technology. The law libraries committee of the ABA Section of Legal Education and Admission to the Bar is charged with periodic review of the accreditation standards relating to law libraries and the law library sections of ABA questionnaires. Law school library directors frequently serve as members of ABA/AALS site evaluation teams established for law school accreditation reviews, and are usually represented on the ABA accreditation committee and on the AALS membership review committee, as well as on the committees devoted primarily to library matters.

Outside the United States, there are a number of other national and regional associations of law librarians, which provide venues for professional activity and continuing education for academic law librarians, as well as for their colleagues in other types of law libraries.^[81,82] A list of known law library organizations (some of which may not be currently active) includes: Arbeitsgemeinschaft für Juristisches Bibliotheks- und Dokumentationswesen/ Association for Law Librarianship and Documentation in German-speaking countries; Association Belge des Bibliothécaires et des Documentalistes Juridiques (Belgium); the Association of Swiss Law Libraries/Association des bibliothèques juridiques suisses—Vereinigung der juristischen Bibliotheken der Schweiz; the Australian Law Librarians Association; the Bahamas Association of Law Libraries; the British and Irish Association of Law Librarians; the Canadian Association of Law Libraries/ Association canadienne des bibliothèques de droit; the Caribbean Association of Law Libraries; the Consortium of Legal Resource Centers and Legal Information Specialists (Central and Eastern Europe); the Law Librarians' Group of Malaysia; the New Zealand Law Librarians' Group; the Nigerian Association of Law Libraries; the Nordic Law Librarians' Group; the

Philippine Group of Law Librarians; the Organization of South African Law Libraries/Organisasie van Suid-Afrikaanse Regsbiblioteke; Red de Bibliotecas de Derecho y Ciencias Jurídicas (Argentina); the Russian Association of Law Libraries/Assotsiatsiia Iuridicheskikh Bibliotek; the Scottish Law Librarians' Group; and the Turkish Platform of Law Librarians/Türk Hukuk Kütüphanecileri Platformu.

Twenty-First Century Roles

In the twenty-first century, like other institutions, the law school library faces a variety of challenges from the impacts of technology and globalization, as well as from continuous change on all fronts. In many ways, the law library's long-standing mission remains similar to what it has been, while the means to accomplishing that mission have changed. The responses of academic law libraries to a changing environment can be seen both in the increased attention given to building stronger collections in foreign and international law and in non-law materials, and in efforts to improve access to digital information through electronic publication projects.^[83,84] In addition, many academic law librarians have taken leadership roles for general technology development and implementation within their law schools.^[5]

Yet, because technology-based solutions to information storage and technological advances in information access and retrieval serve to provide ubiquitous access to information, they can be characterized as challenging the future value of the library as a physical place. If books are less important to legal research, and if students (and faculty) prefer to work with online information sources, why should law schools devote significant areas of their physical plants to collections of books? If the Internet makes legal information readily available through any wired or wireless network, why should any space at all be used for a library? How important will an institution historically centered on the acquisition and preservation of print information be in an increasingly digital information environment in which less information is acquired in physical formats? Is the role of the law librarian so tied to the law book and to physical library collections that the profession itself is no longer relevant to the information needs of law faculty and students? What kinds of new skills will be needed?^[85,86]

Conclusion

In light of these and similar questions, it will be essential for law librarians to think hard about core values and the services they and the law library itself provide.^[87,88] Is the law library a place only for the storage of books for students to study and perform research, or does the law school library provide an important (or perhaps the only) shared space in the law school where students can

work and learn collaboratively with each other and with faculty, and to work with librarians to develop legal information literacy skills? What must the profession of law librarianship do to continue to grow, and to foster the new leadership it will need to meet the difficult challenges it faces?^[89] It is likely that the future of the academic law library will be shaped in large part by law librarians' answers to questions like these, as well as on the library's ability to reshape its role in a new information environment.

LAW FIRM LIBRARIES

Introduction

“[A] law office library combines the student atmosphere of research with the stimulating activity of big business.”^[90] The business is a law firm, providing legal advice to clients. The library exists to meet the research needs of the law firm's lawyers. The librarians try to anticipate those research needs so they can: 1) help lawyers clarify and refine their research project; and 2) provide a timely and cost-effective solution for that research project. Historically, the firm used the library space and library collection to impress clients, opposing counsel, and potential hires; the leather bindings, full shelves, large writing surfaces, and comfortable chairs suggested success and wisdom to clients and opposing counsel. Today, the librarian solves information problems unconstrained by a physical library collection.

In 1956 a law librarian described her role as “to keep happy anywhere from 35 to 125 lawyers, whose diversified interests may cover anything from having ‘235 U.S.’ delivered at once to ascertaining all the stops on the New York subway system and the Hudson Tubes to New Jersey or to producing a speech delivered in the Maritime Provinces. . . .”^[91] More than 60 years later the librarian's role still includes fact gathering and document retrieval from many time zones. Law librarians use hundreds of online sources to research legal topics unknown in 1956, gather information about companies engaged in global commerce and monitor activities of competitors. In addition, the librarian negotiates contracts and license agreements with information vendors, outsources some library tasks, and creates systems that let a less highly paid person find basic information that once required a professional librarian.

Customers, Users, and Owners

The law firm library serves two groups of customers: 1) the firm's lawyers; and 2) the employees supporting the lawyers—paralegals, law clerks, secretaries, records center, accounting department, etc. The first group includes partners or shareholders—the owners of the firm. The

second group of employees often request information for the partner(s) and are the most direct users of the library. This means that often the heaviest users of the library are those with the least political clout or influence when it comes to spending money on the library. The customer base tends to be more homogenous than the clientele is in public libraries. Customers in the law library are part of the legal service industry—even if they are relatively new to it. Typically, all have college educations and over half of the customers have law degrees.

The primary customer of the law firm library is the individual attorney seeking a solution to an information problem. That attorney either contacts the librarian directly or through an intermediary—a secretary, a paralegal, or another attorney. These delegated reference/research requests often pose the greatest challenge because the messenger is not the requester and may not have a full understanding of the problem. Often the requesting attorney is unavailable for clarification. So, the librarian seeks to discern the intent of the attorney through the messenger to first understand the information request and then to complete the request within the constraints defined by the attorney.

Often, the key decision makers in the firm seldom use the library directly, because they are too busy working directly with key clients. They delegate research work and receive synthesized research results in the form of memos of law. They often do not realize the extent to which the library supports their information needs and can easily feel like the library does nothing for them personally.

Some libraries provide service directly to the firm's clients:

- Document retrieval requests
- Monitoring legislative activity
- Researching case law
- Finding statutes on a particular topic
- Compiling a chart of state statutes on a particular topic
- Doing business research on a competitor, etc.

Sometimes the request comes through the responsible attorney and sometimes directly from the client. The library contributes directly to serving the client and thus building and maintaining the client relationship.

One customer type, the summer law clerk, or summer associate, hopes to work as an associate at the firm. The summer clerkship serves as an extended job interview—where the firm continues to evaluate the clerk and the clerk assesses the firm as a potential employer, rather than a job where work is produced.

The large law firm hires summer clerks with the expectation of offering them jobs. The firm has already invested significant amounts of money to find and entice the law student to come to work for the summer. A significant part of the clerk's job during the summer involves legal

research. However, because most summer clerks have minimal research skills, they start their summer worrying about their ability to find the right answer. The librarian serves as bibliographic/research instructor and nonjudgmental resource for the frightened, stressed clerk. This role of research consultant enables the librarian to make the firm more attractive to the clerk by helping to improve the clerk's research skills. In addition, the librarian can also evaluate the overall effectiveness of the clerk and the likelihood of their success as an associate.

Services

Most libraries provide staffing during the firm's normal business hours, 8:00 A.M.–5:00 P.M., Monday–Friday. The global economy forces lawyers to extend their hours and librarians change their service hours accordingly: opening earlier and staying open later to provide assistance during the time when most lawyers are in their offices. Law firms with multiple offices and librarians in multiple time zones provide extended coverage to the entire firm through telephone and e-mail. Some firms are testing instant messaging to communicate with users and ways to best send documents to personal data assistant (PDAs).

Reference services include the traditional quick reference and bibliographic instruction services that answer questions such as: “Do we have?” “Where is it?” “How do I?”

In research, the librarian answers the question: “Can you find the statutes and/or the cases on the following issue(s)?” “I’m meeting this person tomorrow, what can you get me to inform me about their business?”

Research provides an opportunity for the librarian to add value to the basic answer by synthesizing from many sources the solution to the lawyer's information problem and by making personal/professional observations about implications and possible interpretations of the research.

Business briefing book preparation involves locating, selecting, compiling, and summarizing information about a company. This form of research has grown in importance because law firms face intense competition for quality clients. The briefing book enables the lawyer and the firm's marketing professional to identify the client's needs that the firm can best meet. It also gives crucial background information so that the lawyer can demonstrate the firm's understanding of the unique challenges facing a business owner.

Access to information

The Catalog. Catalogs began as a simple list of the books owned by the firm. As the collection grew, the catalog evolved, first to a card catalog and then to an online catalog. The quality of cataloging correlates with the resources available to the librarian. Namely, the better-funded the library the more effective the catalog access to

the material in the library's collection—both physical and virtual. As librarians worked through the process of cataloging their collections, they allocated significant resources to building a detailed inventory of their collections. This was done by either assigning a significant portion of a staff member's time to the project, or by contracting out the project to a third-party service. Law firm library catalogs continue to evolve to provide access to books on the library shelves, electronic subscriptions available online through the Web, or in CD-ROM towers and “free” resources on the Internet.

Law librarians use Web technology to provide access to information by building and maintaining the library page on the firm's intranet or building and maintaining the firm-wide intranet. The intranet includes links to answers to commonly asked questions such as “how do I . . . find a translation service, find a zip code, find a case.” It also organizes online research resources, whether fee-based or at no additional costs, by the ways the library's customers think of them. The organization could be by practice area, by geography, etc.

Librarians apply their skills of collecting and organizing externally produced information to internally created information and build knowledge management systems. Lawyers use these systems to find prior work product so that they can customize a solution to a client's problem. “Work product” could be a research memorandum on a point of law, an agreement for a purchase or sale of a company, or a response to a request for proposal from a potential client.

Interlibrary Loan. As a way to provide access to materials not in their library—whether not owned or not on the shelf, law firm librarians built interlibrary loan (ILL) systems as soon as there were two librarians in the same city. These systems function more informally than academic and public systems. Law firm librarians use phone calls and e-mails to expedite requests that must be filled within hours, not days or weeks.

Current awareness

Current awareness services include paper-based services: clipping articles from newspapers, routing newsletters, routing photocopied tables of contents of periodicals, maintaining a vertical file of continuing legal education (CLE) opportunities, as well as electronic-based services: subscriptions to electronic newsletters, and creation of customized electronic newsletters that are either e-mailed or posted on the firm's intranet.

The physical routing of material uses route slips. Generally the priority on the route lists is by seniority in the firm. But, in some libraries it is adjusted to reflect the need to know, political clout, or circulated in straight alphabetical order. The alphabetical approach includes a periodic reversal of the list or randomizing it so that everyone is

reminded of the need to promptly read the current-awareness material. This system saves subscription costs by sharing a subscription but increases lost opportunity costs if important information is delayed when one of the individuals does not promptly read their mail. In that instance a person further down the list may not get the weekly item for many months.

Increasingly, current awareness is electronic only—whether as e-newsletters, e-zines, RSS feeds, or customized regular searches of commercial databases that are pushed to the customer's desktop or PDA.

Cite checking

Cite checking validates citations in a brief or memo by looking up each cited source and comparing the proposition for which it is used or any quotations against the original source, and confirming that the case or statute has not been overturned or superseded.

CLE provider, credit tracker

Continuing legal education is mandatory in 43 states.^[92] To keep their licenses active lawyers must complete a designated number of CLE hours within a specified time. Librarians organize events, teach courses, and maintain systems to track the credits earned and needed. Tracking CLE becomes an element of knowledge management systems when librarians track the subject matter of what was taken and by whom so that others can consult with the attendee.

Training includes the overview orientation to the library, its collection, and services. Training can also include the traditional bibliographic instruction of how to use available information. These sessions may be in small groups, but most often they are one-on-one, provided just in time, when the lawyer needs the training. New technologies expand the just-in-time training; enabling librarians to develop self-paced computer-based instruction, or to train remotely by viewing the user's computer screen.

Conflict checking

Conflict checking involves searching the firm's internal databases for clients who might be on the other side of a legal matter. The ethical code for lawyers precludes representing two sides in the same dispute. Further, without specific waiver from the client, the law firm may not represent a client in one proceeding and oppose the client in another matter. Librarians build the systems to search internal records for existing clients and external sources to identify the corporate structures to properly name all the affiliates of a company.

Impact on Other Units within the Firm

The library's research resources and skills aid the marketing department by finding the information for responding to requests for proposal. Current awareness services include alerting the human resources department to new developments; the accounting department for currency exchange rates and accounting standards; and the facilities department with comparisons on equipment, space allocation in other industries; and new standards for office equipment.

How Does the Library Achieve the Organization's Goals?

The library achieves the firm's goals by first understanding the goals of the firm; second by aligning the library activities with the firm's goals. Typically that means encouraging cost-effective research and applying ongoing and rigorous cost-control efforts—only buying information that is likely to be used and canceling and discarding that which is not used.

Recent Developments

Five recent developments impact law firm libraries. First, the information explosion and the Internet have increased the online availability of more cases, more statutes, more regulations, more news sources, and different search engines. These developments make clients wonder why, if everything is available for free on the Internet, they should have to pay extra for information. Clients often are not aware that online sources are purchased by the firm.

The second factor is the growth of branch, or other offices. In the 1980s and 1990s law firms expanded their markets by opening offices in other cities to better serve an existing client or to serve a developing area. With the branch office, came the need for a library and the challenges of managing remote services. Sometimes the solution was to staff the branch library, sometimes to depend on the central office.

Third, the changing and expanding roles of professional law firm staff impacts the law library. For example, the office manager evolved to a firm administrator and then to an executive director. With each change, the individual assumed greater responsibilities in governing the law firm. That role change demands that the librarian think and act in a more business-like manner. Librarians' roles also evolved to assume greater responsibility for information collection, organization, and reuse. About one-third of law librarians now have nontraditional roles: supervising the records center or the conflicts checking department, the firm intranet, CLE, or knowledge management.

The fourth factor is the increasing number of law firm mergers involving firms that already have librarians. While the merger increases the resources available for information

problem solving it also may create overlapping skill sets in the library staff and displace some of the staff.

Fifth, the “google-ization” of research expectations. Not only the younger customers but also the older ones now believe they should be able to find the answer themselves by just typing words into a search box.

Principal Concepts—Alternative Interpretations

In the law firm, significant numbers of the library’s customers are the partners or shareholders who own the firm—and the library. The law firm, while it exists to serve clients, must also make a profit by providing quality client services in cost-effective manner to clients who will pay their bills. The traditional law firm bill includes an hourly rate and disbursements, money the firm spent while doing the client’s work, for example, court filing fees, long distance charges, etc. Hourly rates are calculated using the costs of having the firm open, using factors such as rent, utilities, salaries, benefits, etc. The two biggest factors are how much profit the partners want for a given level of work and what they think the market will bear. In recent years, clients have been asking for predictable pricing. Predictable pricing is where the client knows in advance what the work will cost.

In each of these two billing models, the librarian contributes to the firm’s bottom line by promoting the most cost-effective research possible. In addition, law firm librarians record the time they spend on reference and research projects. By recording their time, the firm can bill the client for their time—just like lawyers’ time. Even if the time is not billed to the client, it enables the firm to analyze the cost of servicing the client.

Time

Law firm work is always driven by deadlines: court filing deadlines, contract acceptance deadlines, etc. The Internet has compressed time and magnified its importance. Clients work in multiple time zones around the world. The firm itself may have offices in multiple time zones. When communication went at the speed of the mail, the client did not expect an immediate answer by return mail. While there was never enough time to research every possible nuance, there was time to reflect on the advice to be provided. Now, with clients expecting a call back from someone within 30 min and an answer within hours instead of days, time is in even shorter supply. The successful law firm uses the skills of law librarians to get higher quality answers faster and cheaper than lawyers themselves can supply.

Technology

Law firm libraries were one of the first departments in the firm to apply technology. While accounting first applied

technology to crunch numbers for billing clients, the library used technology to solve information problems and thus led in introducing technology to the rest of the firm. The library first had stand-alone terminals for online research. Later, libraries used spreadsheets to manage budgets, word processors to summarize research results, and database programs to manage serials and create online catalogs. Now, the computers—but now desktops and laptops—include word processing, spreadsheets, Internet browsers, and access to CD-ROMs, access to subscription databases, and time-entry programs.

Budgeting and planning

For many years libraries operated without budgets or forecasted spending. They spent as much as they wanted or needed. As law firms continued to become more business-like, librarians adopted budgeting techniques to track and forecast their expenditures. The budgeting and planning reflect the business acumen of law firm management and the pressures facing law firms’ profitability. Over 80% of law firm library budgets goes to electronic resources.^[93] Almost 90% of the print budget is spent on keeping the library current and up-to-date. Some firms treat flat-priced online research contracts as part of overhead; others try to recover the cost through charge-backs to clients. Sometimes the income from charge-backs is treated as an offset to the library budget and other times it goes in a separate category.

As part of for-profit organizations, librarians must address tax and accounting issues like sales tax, property tax, and capitalizing versus expensing items, and then, if items are capitalized, track the depreciation. For multilocation libraries, sales and property taxes can mean that taxes are paid on an item when it is shipped to one location for processing and then taxed again as personal property at the ultimate location.

Physical Arrangement/Space

Design also communicates what activities matter. Firms that view their primary stock in trade as their knowledge and intellectual capacity like to show off their libraries and configure space so that clients can see lawyers at work.^[94]

Constrained by the space available, law firm librarians seek to arrange the collection in an overall useful fashion. The traditional configuration used broad topical areas. Cataloged and classified collections are arranged in call number order. Some firms use satellite libraries (subsets of the collection or duplicates of selected subject matter titles on other floors near significant practice group members). A centralized or consolidated collection is easiest for the staff to maintain. Satellite libraries, because they put the books closer to the lawyers, are easiest for the customer.

The satellite library does not encourage coming to the central library or asking a librarian to conduct a research project for the attorney.

Seating type

The number of study spaces ranges widely—from one per every ten attorneys to one to twenty or more. Lawyers tend to do research with several books open to different cases or statutes, so they can more easily compare the language in each. This means that each study space, whether a table or carrel, has a larger work surface than in other libraries. Many libraries have physically downsized, making extensive use of hybrid collections and compact shelving to house the physical collection. Instead of built-in carrels, they use modular furniture to permit using the space for other functions.

Collections

Collections range from less than 10,000 volumes to more than 70,000 volumes. Libraries collect both external and internal information sources. The external sources include hard copy and electronic materials. “Hard copy” includes the traditional hardbound texts, treatises, court reporters, statutes, etc. Most of the hard copy books are supplemented with a paperbound pamphlet inserted in the back of the book; others are loose-leaf—binders with loose pages that can be replaced with updated text. The collection may also include microforms, audio, video, CD-ROMs, and other electronic media via Web, dial-up, or leased line. Internal sources include memoranda of law files, brief banks, and opinion letters written to clients. Some libraries use podcasts or MP3 players to distribute CLE programs.

Libraries have a core collection of the primary and secondary materials in the jurisdiction(s) in which the firm practices. Primary materials are the law itself: statutes, regulations, and cases. Secondary materials explain the primary materials. Finding materials provide means to locate the primary and secondary materials.

Libraries physically expanded in the 1980s as many law firms moved to new space. New libraries were designed to double the size of the collection every five years. However, in the 1990s the collection growth rate slowed and even began to shrink. Causes for this reversal include: expensive real estate leases that made justifying housing books difficult when many of the primary sources of law are also available electronically; and the continuing codification of American law, namely, more reliance on statutes and regulations than on case law. This codification in turn enabled a new work, the handbook that compiled the most relevant statutes, regulations with minimal commentary into one or two volumes. This provided the perfect desk reference for the attorney to find a quick answer while on the phone with a client.

Serials

Serials comprise about 90% of the titles in a law firm library. Serials control systems range from manual ones, such as Kardex files, through specially adapted, created computer files such as word processing documents, spreadsheets, or databases to integrated serials, circulation, acquisition, and catalogs. Some libraries record invoice number and amount for each item, in addition to keeping a copy of the invoice and sending a copy of the invoice to accounting.

The nature of law, as an ever changing discipline, requires that the materials be updated constantly so that the most recent information is available to the lawyers. Publishers address this problem with different approaches, for example, pocket parts (pamphlets inserted in the back of books). The pocket part is arranged like the parent volume and includes new law, case analysis or commentary by chapter, and section or page number of the parent volume. The researcher reading the main volume must check the pocket part for newer information. When the size of the pocket part becomes too large to go into the back of the book it may become a freestanding supplement shelved after the book or the publisher may recompile the complete title into a new edition. Another approach is loose-leaf services. Binder volumes are updated by a package with instructions of which pages to remove and discard and which new pages to insert. Because the revised material is integrated into the text, the researcher saves time. Typically, loose-leaf services cost more than pocket parts both in dollars to the publisher and in the time to file the updates.

Many law firm librarians have stopped binding law journals and other legal periodicals. They reason that they are less likely to lose the entire volume—one issue may be off the shelf, but the other three issues are still on the shelf. In addition, the pressure for space savings and cost controls impels the decision not to bind materials that probably will be discarded in five years or less. The availability of electronic full-text and images of the journal further reduces the need to dedicate lineal feet to little used materials.

Collection development policies

Most collection development policies are informal and unwritten. They generally “support the immediate information needs of the practitioners” in that particular firm. Thus, one library that does extensive appellate work may have a historical collection of proposed regulations, extensive legislative histories, and old editions of significant treatises. Another firm will have a different collection with little historical material because of the nature of their work.

Generally, the library seeks to have core materials to support the practice. The largest libraries define core materials to include multiple treatise titles on the same subject to give alternative views of the issues. Law firm libraries usually rely on academic and court law libraries to maintain extensive historical collection of earlier versions of statutes, regulations, or treatises. These materials are of interest to the legal scholar tracing the development of the law but are seldom used by the practitioner.

Demand drives the number of copies of works held in the collection. If a set is frequently used in a lawyer's office, the librarian acquires multiple copies of the title. In recent years as space constraints and budget limitations loomed, especially when coupled with the ability to retrieve documents from various electronic sources, the number of duplicate copies has shrunk.

The collection is primarily legal information. However, the trend is to include more nonlegal information because the practice of law now requires research in other areas. In addition, the nonlegal materials help the lawyers understand their clients better.

The reverse of acquiring, reviewing for continued supplementation, and/or discarding also varies widely. Decisions range from the librarian acting alone to heavy lawyer involvement in the process. The heavy involvement can vary from lawyers physically coming to the library to look at the materials, to lawyers reviewing compilations of the materials with notations indicating costs and frequency of use. In other scenarios, the librarian surveys when the renewal comes due and/or reviews the complete subject matter at one time.

The retention policy varies from keeping permanently to keeping only the most recent few years of newsletters or law journals. Librarians, limited by space, are cognizant of alternative sources for the information. Citation patterns indicate the heaviest use of most materials is within two years of publication.

Classification

Law firm libraries use many approaches to cataloging and classification. Most generally follow the LC classification with local variations to reflect the firm's practice. For example, the LC classification puts pension materials in the labor area, but for many firms the pension practice focuses on tax aspects so these materials are reclassified into the tax area. The degree to which the collection adheres to the LC scheme is often driven by the maturity of the library.

However, for smaller firms that have not had the money and people to manage their resources, the collection may lack an inventory, a catalog, or a classification scheme. Books are arranged in the manner that reflects the most vocal and important of the library users—probably by their practice preference. Thus, if one person takes the book off the shelf and another returns the book—especially if some

additional books have been taken in the interim—the first book may not be reshelfed in the same relative place.

Circulation Systems

Law firm libraries, unlike public or academic libraries, can show people in the firm who has the book checked out. This improves the use of the collection because the attorney is able to find who has the book at any hour and can call or go to their office to use the book. Circulation systems range from a notebook for the title, date, and initials of the attorney taking the book, to small cards and pockets with the cards completed and left in a box at the library entrance. Another method uses oversized cards in the book, which are to be left on the shelf in place of the book. A few of the largest libraries now have systems with bar code readers or radio frequency identification (RFID) tags that integrate the circulation records with the online catalog.

Unfortunately, there is no security in a law firm library, except within the office itself. In other words, any time the office is open, so is the library. This means it is easy to walk out of the library without properly signing out the book. These “not on shelf/not signed out books” slow the lawyer's response to the client. Efforts to find the needed information for the lawyer include office searches, contacting the likely users of the book by phone or e-mail, broadcasting e-mail to the entire firm, borrowing the book, or replacing it.

Staffing

Staff sizes range from one solo librarian to staffs of 20 to 50, reflecting the size of the firm, the nature of the practice, the location of the firm, and the ability of librarians to prove their worth to the firm's bottom line. On an average, there is one professional librarian for every 22 attorneys.^[95] Many law librarians work in a solo shop with little or no clerical support. Most do not have the opportunity to bounce ideas off a peer during the normal workday. The solo librarian can achieve that professional interchange through participating in the local, regional, and national professional associations, and by regularly planned lunches with colleagues from other firms.

Positions in the law firm library include professional, paraprofessional, technical, clerical, and administrative. The title manager, director, supervisor, or simply librarian indicates who is responsible for managing the library. The title reference librarian denotes one who focuses on providing reference and research answers. This person may also have special expertise in one or more subjects, for example, tax, trademark, patents, immigration, labor, or business. Regardless of title, the actual responsibilities for each staff member cross the traditional functional activity lines because there is usually not enough work to keep a single function position busy for a 40 hr week.

Librarians report either to a library committee, usually comprised of partners or associates, or to a library partner, the firm managing partner, information services director or the executive director/chief operating officer. Increasingly, the librarian's performance review includes how closely aligned the library is with the firm's business objectives.

Education

A master's in library science (M.L.S.) is the entry-level professional degree. A significant number of law firm librarians also have law degrees. Law firms tend to be practical in orientation, so demonstrated skill and experience can substitute for the M.L.S. With more nonlegal research being done in the firm, an additional master's degree in business, science, or technology can increase the value of the librarian to the firm.

Clerical, technical, or paraprofessional positions typically require a Bachelor of Arts (B.A.) degree or, significant demonstrated experience. These nonprofessional positions may include library network support, such as maintaining the library's portion of the technology network, maintaining the firm's intranet page, etc.

Continuing education

Law firm librarians find opportunities for continuing their education in local, regional, and national programs. The AALL's annual meeting typically draws one-third to one-half of the law firm members of the Association. In addition, AALL offers workshops in different cities. Local or regional chapters supplement the offerings of the national / education opportunities as well: the Association of Legal Administrators has chapters in almost every city and also offers many telephone conference programs. The Special Libraries Association and general library associations also provide opportunities for continuing professional education.

Finally, each of the largest legal publishers presents programs on topics related to private law firm librarians.

Experience and skills

The AALL 2005 Salary Survey reported that, on average, law firm librarians have held their current positions for 7–8 years.^[96]

History

Lawyers rely on information—statutes passed by legislatures, written opinions from judges, and commentaries or treatises written by scholars or practitioners. The solo practitioner in the 1800s, as now, might have survived with very few books. As lawyers joined together forming law firm partnerships, their book collections grew. As the

number of lawyers in the firm increased, the book collection grew as well. At around 50 lawyers, the book collection—and the information needs—becomes so large and so complex the firm hires a librarian.

One of the earliest law firm librarians, Elizabeth Finley,^[97] began her career in New York in 1921. In 1961 she was the first law firm librarian to serve as president of AALL. Through the 2007–2008, a total of five law firm librarians served as president: Jack S. Ellenberger 1976–1977, Carolyn P. Ahearn 1991–1992, Mark E. Estes 1992–1993, and Kay M. Todd 1993–1994.

Future

Law librarians will work more outside of traditional roles and the physical confines of the library in the future. They will pay greater attention to customer service by attending to what the customers value, not just what the customers say they want. They will translate their customers' needs to publishers to create customized information products. These customized information products will enable customers, to retrieve more quality information for themselves.

Challenges

A current trend in law firm recruiting is to hire more attorneys with three to five years of experience and fewer recent graduates. These attorneys come to the firm with expectations of library service from their old firms that differ from the services available in their new firm. This challenges librarians to create ways to break the habits and expectations of these experienced new attorneys and convert them into loyal customers.

The law firm librarian's customers range in age from mid-20s to 70-plus. Generally, each of these generations has vastly different levels of comfort and skills in using technology to solve information problems. The youngest attorneys tend to be the most comfortable with technology while the oldest tend to be the least adept with it. The youngest technologically savvy attorney expects Web-like searching and has poor legal research skills. The older attorney has better research skills, but limited computer skills. This challenges librarians to balance the demands for hard copy materials with the demand for desktop, Web-based research tools, etc. Librarians also need new technology skills to keep up with the younger attorneys.

Time constraints on getting/using information

The demands of clients require faster than ever turnaround times from attorneys. This challenges some tenets of traditional collection development practices. Namely, libraries do not need to own everything if a book can be borrowed quickly. Attorneys often do without the information because they cannot wait the one to two hours

required to borrow the book. Librarians must revise collection development policies and ILL procedures to provide timely access to information within limited budgets.

Proving the return on investment value

The decision makers in law firms seldom use the library. Therefore, the librarian must build the case that money spent on information resources earns a significant return on investment. Librarians must track usage of library resources and the time spent on reference and research projects for clients and firm projects. These firm projects include preparing the business dossiers for business development and designing and maintaining information resource systems. The librarian must report these statistics in a concise and meaningful way that demonstrates that the library saves the lawyers' time, and makes them more productive and the firm more profitable.

Confidentiality

While some firms emphasize the confidentiality requirement by requiring employees to sign a confidentiality agreement, the employee is bound by the same ethical standards that apply to lawyers: namely, to not disclose confidential information to people outside the firm. Nondisclosure includes the seemingly innocent remark of what a client plans to do in a future transaction. With publicly traded companies, this sort of breach could subject the librarian to federal insider trading laws as well.

The firm, in order to protect itself against conflict of interests posed by one or more attorneys or staff who worked for another firm or company adverse to a client, erects ethical or confidentiality walls. These ethical walls are intended to keep the attorney from seeing any part of the client's file without prior clearance. The librarian, as knowledge manager, who knows when someone has researched a similar topic or issue, may inadvertently put two attorneys together to talk about a research result that could violate the ethical wall. The challenge then is to integrate the barriers of ethical walls into the knowledge management system.

PUBLIC LAW LIBRARIES

Introduction

The term "public law library" refers to all law libraries that are not affiliated with either law firms or law schools. In this category are found county public law libraries, court libraries, state law libraries, state and federal agency law libraries, and bar association/subscription law libraries. Clientele, funding, and governance are the main differentiating factors between these entities. Collections, staffing and credentials, facilities, teaching methods and

responsibilities, national standards, and advocacy and public outreach are all important characteristics that make public law libraries quite different from those in law schools and law firms.

Public law libraries are a major component of the justice system, as they provide the information necessary for litigants to access the courts. In fact, they have been referred to as the first rung in the ladder to justice.^[98] They generally differ from academic and law firm libraries in that they are funded by the public in order to serve the public. Although there are many variables and more than a few exceptions to this statement, the public's right to access the law that it is required to follow is the principle that supports the existence of public law libraries. The rapid growth in the number of self-represented litigants, the escalation of the costs of maintaining library collections at a time of decreasing resources, changing competencies required of staff and directors, and the harnessing of technology to accomplish the library's goals are all elements of the public law library in the first decade of the twenty-first century.

Customers

The public law library, by definition, is generally designed for use by the public. Courts have seen an astonishing growth in the number of people who are involved in some kind of litigation or court action and not represented by legal counsel. Statistics vary across the United States, with over 75% of divorce cases having at least one party proceeding "pro se" (without an attorney) known as "pro per" in California, and close to 85% in landlord/tenant matters.^[99] A Legal Needs Study that was conducted in Montana in 2005 determined that there were over 207,000 unmet legal needs each year for a state with a population of less than 920,000 people.^[100] The loss of funding for legal services resulting in fewer legal aide attorneys is one factor that is driving this trend. There also is the perception that disagreements previously settled by family, friends, and the parties simply talking out the issues are now better solved in court, fueled by the media and television shows like Judge Judy.^[101]

As law librarians are committed to providing access to legal information, it quite naturally has fallen on them to take on an important role and growing responsibility to serve the unrepresented. Although the basic tools of legal research, such as statutes, opinions, and legal forms, have always been available, law librarians are finding themselves more involved both institutionally and individually in providing resources to assist this major portion of their customer base. Everything from collection development, staff training and retention, and Internet presence and other technologies has changed in order to accommodate the demands of these customers.

Most self-represented litigants have not studied the law, are not familiar with many of the Latin and archaic

terms still used by courts (such as *stare decisis* and *res ipsa loquitur*), and have little experience with the judicial system. These clients come into the law library with significant disadvantages. It is difficult for them to understand the materials that have been developed for attorneys to navigate the legal system. They often do not have access to the Internet unless it is at their public law library. The mothers among them frequently cannot find affordable child care and therefore must bring their young children with them. These factors have driven significant changes in how public law libraries do their business. Self-Help book collections are being moved so that they are more available near the entrance to the library, Web information is being produced to include forms and explanations of court procedures, and reference and access services librarians are receiving special training on the difference between legal information and legal advice,^[102] how to assist difficult and angry people, and how to assist those who do not speak English. Many law librarians are now partnering with public libraries to assist the courts with the significant increase in unrepresented litigants. The hope is that if reference staff at public libraries can be expert navigators on court and law library Web sites, they will become important community partners in our effort to provide access to justice systems and ease the burden on court staffs.

Public law libraries have frequently assumed the role of legal resource center for the practicing bar. Although large law firms may have their own in-house librarian, sole practitioners and firms of fewer than 100 attorneys (82% of all private practice in the United States according to the ABA)^[103] do not have significant law libraries and rarely have librarians to provide legal research and reference service. When these legal professionals cannot find what they need through subscriptions to online databases, they rely on their public law library for research. Judges, law clerks, and judicial assistants use their county and state law libraries. Legal counsel to state and federal agencies and public defenders also rely on the resources of public law libraries.

Law firm libraries and law school libraries have defined user populations, for which they establish their policies, collection development, and staffing priorities. Public law libraries have challenges provided by an infinite variety of customers. In a one-hour time frame the library could be serving a high school debate student, an appellate judge, an angry father who is about to lose visitation rights, someone in state government who needs access to the federal regulations on water quality from 10 years ago, a bankruptcy attorney, and a visiting law professor from another state or country. This diversity makes the management of the public law library interesting and challenging, and it requires nimble administration.

Governance and Funding

Most public law libraries are governed by a board of trustees, similar to a general public library. Usually, the

members of the board are stipulated by statute or ordinance, and are chosen to represent the constituent's interests for services and resources. However, it is not at all unusual for the trustees themselves to be infrequent users of the library. For example, many state and Supreme Court law libraries are governed by the state's supreme court justices. These officials rarely do their own research, as they have law clerks for that purpose; thus, they infrequently come into the library. Their most common need for assistance is when they need access to statistics, published humor, or quotations for teaching or addressing the public.

County law libraries are generally established by statutes or ordinances, where their funding mechanisms are laid out, but they can also be governed by local bar associations. In some instances, this has led to charges of conflicts and cronyism, since, although the library is supported by either filing fees or taxes paid by the public, only lawyers can decide what materials are to be purchased and what staff should be hired. Recently, county law libraries have been scrambling for funding, as formulae for the sharing of court filing fees have changed dramatically. In Florida, for example, funding dropped precipitously in 2004 when the state legislature reconfigured how filing fee revenues would be distributed.^[104] This was a decision made by authorities far removed from the affected program, who generally can afford attorneys for personal and business use.

The exception to this scenario is the private, subscription law library. The oldest law library in the United States, Jenkins Memorial Law Library, is supported by the dues structure into which its members pay.^[105] These libraries generally allow nonmembers (the public) on-site access for a nominal daily fee. Other prominent, historical law libraries of this character include the Social Law Library (Boston), the New York Law Institute (New York City), the Library Company of the Baltimore Bar, and the Cincinnati Law Library.

In searching for additional funding, many other public law libraries have taken on part of the character of the subscription law library. By offering special services to dues-paying members, the King County Law Library in Seattle and the Sacramento Public Law Library have generated both more revenue and a loyal customer base.^[106]

Most state law libraries are funded through appropriations from their state's general fund. Usually they are not allowed to keep any revenue that is derived from activities such as photocopying and document delivery. When it is legislators who make the ultimate decision as to what funding will be available to the library, the user is even further removed from the process. For this reason, some law librarians ask especially sympathetic users, such as the self-represented, to testify at their appropriations hearings.

State and federal agency law librarians, including those who work for legislators and attorneys general, are also

funded from appropriations made by legislative bodies. In most other respects, however, these libraries are organized and operated like law firm libraries. They rarely serve the public, and have a defined user base consisting of the attorneys and other employees of the agencies. They also tend to have small collections and only one librarian.

Services

Public law libraries provide most of the services that other kinds of law libraries offer. However, they rarely conduct in-depth research for customers, and the teaching they do is frequently more of the informal, “teachable moment” variety. They spend considerable time and resources developing finding guides and explanations to legal process and procedure which can be placed on their Web sites.^[107,108] They work with public libraries and state library associations to train public librarians on how to use their Web sites and when to refer patrons to the law library.

The issue of legal information vs. legal advice, or the unauthorized practice of law, is a hot topic for many public law librarians.^[109] There is considerable effort to make reference librarians more comfortable in teaching and working with pro ses.^[110] Basically, the standard has been established that questions that begin with phrases such as “Can I? Where is?” and “What is?” can be answered, as they are fact based. Questions that begin with “Should I?” cannot be answered, as they involve giving legal advice as to what action should be taken.

State, court, and county law libraries are frequently asked to host tours and informational sessions for students of high schools, trade schools, and colleges, for visiting librarians and scholars, and for other kinds of groups. Court librarians generally conduct in-depth orientation sessions for new law clerks and court employees. They offer brown bag, lunchtime classes on a variety of subjects such as legislative process and intent, state-specific tax resources, and using the library’s electronic licenses.

County law libraries frequently have evening and weekend hours. Most court libraries are open only during standard, business hours. Many court and county law libraries also provide access at any time for attorneys who practice before the court. The attorneys generally sign in with a security guard. After hours, however, there is no staff present in the library, and therefore no reference assistance. This is controversial, and has been challenged by independent paralegals and self-represented litigants. Most federal court libraries only allow access to their libraries if the researcher has an active case before the court, no matter what time it is.

The “Ask the Librarian” button that many libraries provide on their Web sites^[111] may feed into a 24/7 system in which other law libraries participate. The Los Angeles County Public Law Library’s Web site has this information:

24/7 Chat Reference: Click on the ‘Ask Now’ icon to be connected to a reference librarian using real-time chat software. This is a service of the Metropolitan Cooperative Library System, so your question will not necessarily be answered by a Los Angeles County Law Librarian. Reference questions are answered by librarians from California’s County Public Law Libraries, and LA County librarians provide some hours of coverage in answering law questions.^[112]

Many court libraries will order multiple sets of the same title for all judges in their jurisdiction, and have them drop-shipped to the judges by the publisher. These libraries frequently purchase and maintain the collections that are held in judges’ chambers. This can involve a significant commitment on the part of library management when the chambers’ collections are located in other cities, because it requires a staff member to travel to another site. Maintaining chambers collections can be a significant matter, as law books generally have at least annual updates. Loose-leaf services may have to be updated as often as once a week, and court staffs rarely understand why the weekly releases cannot be ignored.

Some state law libraries design and manage the Web site for the entire judicial branch of government. Others take their court’s opinions and appellate briefs, and place them on the Internet.^[113] These services keep the library in the management loop of the branch, and contribute law librarians’ hopes that others will have high opinions both of their competencies in the digital age and their commitment to serve the public.

Almost all public law libraries circulate their collections. Some allow any citizen in their jurisdiction to check out materials. Others check out items just to court staff and attorneys. Some will provide circulation to members who pay for the privilege. Public law libraries also provide ILL service for materials in their collection that circulate. Similar to other libraries, law libraries generally will not send titles that have been published out of state in the current year.

Document delivery is a major service of public law libraries, and is almost always fee-based. Many public law libraries derive significant income from providing such transactions. The King County Law Library (Seattle) charges \$20 per citation for documents up to 20 pages long, with a \$5 discount for subscribers. If the citation is incorrect and has to be researched there is an additional \$10 charge.^[106] The Jenkins Memorial Law Library (Philadelphia) charges \$25 for rush deliveries, which does not include costs.^[114] Although photocopying and then mailing, faxing, or sending via an overnight delivery provider were acceptable delivery systems until recently, more and more of the law library’s clients now want their information delivered in a digital format. Judges and litigants like the convenience of taking something that comes to them electronically and merely cutting and pasting relevant text into the legal brief or opinion that is being

written. This is easily done if the information is retrieved from a Web site or from an electronic product. If it is from a print source, the information can be easily digitized and e-mailed with most state-of-the-art copiers. Library management prefers this kind of delivery because it cuts back on envelope preparation and postage expenses. Most public law libraries want to provide and deliver requested information at the time and in the format that is required by the customer. Scanning technology has helped significantly with these libraries' missions.

Other services offered by many public law libraries include the rental of conference rooms, notary publics, free Internet access, custom cataloging for small law firms, and customized research, including expert witness background reports. Today's public law libraries are scrambling for revenues to support their operations. Unlike law schools, which must have law libraries for accreditation, public law libraries are increasingly under attack from those who make funding decisions. Lawmakers at local and state levels ask why the public should support a legal research facility that is used by one special interest group—the legal profession. They have to be shown and convinced not only that lawyers do serve the legislators' constituents, but that more than half of the libraries' users are nonlawyers. The other main purpose for providing such extensive services is to generate a loyal customer base. Public law libraries are run like businesses, and work on many of the same challenges as the commercial sector, including market analysis and client development.

Collections

Some of the largest law libraries in the United States are public law libraries, such as the Los Angeles County Public Law Library and the Social Law Library in Boston. Other county law libraries are very small, with only one or two staff members and collections of less than 50,000 volumes. Suffice to say, there is no average size or average collection. However, the AALL has approved Standards for both appellate court libraries^[115] and county public law libraries.^[116] These standards are annotated, which gives guidance and support to staff, directors, and library boards of trustees.

A strong core collection for a county public law library will have legal materials from its home state, including a complete collection of the published decisions of the state's courts and current and superseded state and local court rules. It will have a state digest, a citation service, and other significant state court publications such as annual reports, court commission findings, and statistical analyses. For legislative materials, it will have current (and if space permits older) statutory compilations, current session laws, the state constitution and its various historical versions, as well as published debates and proceedings of constitutional conventions. It will hold local, county, and municipal codes, charters, bylaws, and ordinances for

the area it serves. If available, the library will have the state's administrative code and published decisions of state agencies, as well as the opinions of the state's attorney general. If there is a state legal encyclopedia the library will hold it, as well as significant state-oriented legal treatises, practice materials, and legal periodicals and newspapers.

For federal law, the library should have at least one set of reporters for the decisions of the United States Supreme Court, as well as a digest for finding those opinions. It will have at least one version of the *United States Code* and the published decisions of the U.S. District Court, U.S. Court of Appeal, and U.S. Bankruptcy Court for its jurisdiction. The library will also have the *Federal Register* and the *Code of Federal Regulations*, and a citation service for these reports and codes. For general U.S. publications, it will have units of the National Reporter System and the digests to go with those reporters. It may have current statutory compilations for contiguous states, and will have a national legal encyclopedia. General legal forms will be available, as well as a broad selection of legal periodicals with an index for finding articles, and other reference tools such as legal dictionaries, legal quotations compilations, and the Martindale-Hubbell law directories. Restatements of the Law, *Uniform Laws Annotated* and *American Law Reports* will be held. A collection of general legal and self-help titles on subjects of interest to the public and the self-represented litigant must generally be held very near the reference desk and/or entrance to the library.

The titles above will be available in print or electronic format, and sometimes both. State, appellate court, and large urban law libraries will hold all the above materials as well, in addition to full runs of most legal periodicals, all major treatises and loose-leaf services, treaties with other countries, significant foreign and international law collections and a strong collection of secondary materials, in particular, see the Los Angeles County Law Library.^[117] Public law libraries serve a broad client base, and their customers' comfort with digital media covers a wide spectrum. The AALL Standards make another point: "While online technology will provide a fundamental baseline for research platforms of future law libraries, certain print collections will always be needed and should be retained as part of the libraries holdings as a balance against countless deficiencies inherent in today's electronic media."^[116]

Many public law libraries are selective U.S. Government depositories. Unlike academic libraries, which usually segregate their government documents in separate collections that are not integrated into their general subject matter collections, most public law libraries catalog their government publications using the standard LC classification system and integrate them into the rest of the collection. Thus, documents emanating from the Internal Revenue Service can be found with commercially published titles such as the *Standard Federal Tax Reporter* and the *Tax*

Management Portfolios. Most state Supreme Court libraries also are depositories for the State Justice Institute. All publications that have been funded by the Institute are distributed to these libraries so that there is greater dispersion of the research for use by state judiciaries.

Public law libraries are running out of shelf space. Most have been in existence far longer than either law firm libraries or the majority of law schools. Many are in older courthouses which have no additional room for library growth. Actually, the court often is looking at the library to give up space for new judges and court staff. Fortunately, solutions are easier to come by now than they were 20 years ago. Public law libraries are turning to cost-effective digital solutions, such as HeinOnline^[118] and Law Library Microform Consortium Digital^[119] to replace long runs of legal materials. The preeminent legal databases, LexisNexis and Westlaw, provide access to most primary materials and many legal periodicals, but are too expensive for public law libraries to use for the purpose of replacing print. Each search carries a price tag. However, the vendors of these databases have begun offering public research subscriptions that are free to the public, by pairing public access to the databases with the contracts for print subscriptions that the library continues to retain. The public work stations are appreciated by the self-represented and solo practitioners, and their availability has been a marketing tool for the public law libraries.

Facilities

There is a wide spectrum to consider when discussing the physical plant of the public law library. The gamut runs from those libraries owning their own buildings to those having only one or two rooms in an old courthouse. In some states, notably California, the county is required to provide space, utilities, and janitorial service for operation of the library.^[120] Some county law libraries have branches located throughout the county. Court and state law libraries are located in their courthouse, which is ideal for serving court employees and those customers who have business before the court. Many county law libraries have been forced out of the courthouse, both due to their escalating needs for shelf space and the increasing requirements for space for new judges. This makes the library harder to find and less convenient to use, as it is no longer near the clerk of court's office and may not have suitable parking.

Twenty years ago, public law libraries worried about having enough seating space. Many had as many tables and study carrels as law school libraries, as well as private briefing rooms for the use of visiting judges and those with long term research projects. Now, however, fewer people access the public law library physically and more use the library's resources from the Internet. The library's ability quickly to e-mail materials and have books delivered overnight has also changed the user dynamics. As a result,

public libraries are not as anxious about having a certain number of desks and chairs available.

Collections for public law libraries do not have to be justified by the number of volumes held. Rather, it is access and ease of delivery that govern collection development decisions. The libraries have had to remodel to accommodate the public access computers now provided as well as special collections that should be shelved close to the reference desk. In the 1980s and 1990s, computers were difficult to install in older facilities constructed before anyone knew that wiring would eventually be required. Now, however, many of these libraries have gone wireless, which has solved many of the challenges posed by remodeling for technology in an historical building with granite walls that are a foot thick.

Staff and Education

Public law libraries tend to have fewer staff than law school libraries and more than firm libraries. There is a very wide range, however, and an average cannot be stated. More than two-thirds of public law library directors have at least an M.L.S., and 22% have a law degree.^[121]

Public libraries are increasingly looking for employees who bring to the information center skills and experience beyond those needed in the traditional library setting. Automation, Web services, and networking specialists are in high demand. Unfortunately, like the rest of the public sector, the library can rarely afford to pay computer specialists what they would earn in the private sector. People with marketing, public relations, and adult education talents are also highly valued.

Employees of most public law libraries are bound by both the ethical standards adopted by the AALL^[122] and whatever confidentiality policies have been adopted by their governing bodies. Court-based libraries have very strict rules concerning the absolute confidentiality of all matters that are before the court. These rules can involve which law clerks are checking out which books, which clerk is being trained on using specific libraries of electronic databases, and even conversations overheard in the elevator. This can indicate which judge is writing the majority opinion. Inadvertent divulgence, in turn, can affect financial markets, the well-being of corporations, and personal lives. Training all staff, not just those working in public services, must include these privacy issues.

Technology

Most public law libraries now have integrated library systems, public Internet stations that allow access to the Web, electronic licenses to legal materials, and copiers that allow for digitizing and e-mailing materials. Technology is no longer the extreme challenge it was a decade ago. After significant staff realignment, physical reconfigurations, and staff training in a plethora of digital

competencies—from HTML mark-up to negotiating electronic licenses, the public law library now has folded technology into its business plan and daily operations.

Connections

Connections and networking in the larger legal community are critical for the public law library's image and continuing presence. Bar associations, legal services and legal aide groups, judicial entities, civic associations, and advocacy organizations all are valued partners for the library. Both print and broadcast media are cultivated to help the public know what services the library offers. Other libraries, such as public libraries and the information centers for other public agencies, are consulted and also joined for cooperative ventures.

Law Librarians usually belong to the AALL. Those in the public sector join AALL's State, Court, and County Law Libraries Special Interest Section. They also generally belong to the AALL chapter for their city or region of the country. It is from these groups that the librarians receive most of their continuing education, professional guidance and mentoring, and have opportunities for networking specific to law librarianship. They frequently also join their state library associations.

Challenges

All law libraries are challenged by the popular notion that everything is available on the Internet, for free. Even when it is the library that has created and posted the information, there is little appreciation by the general public, as well as those decision makers who hold the purse strings, of what it takes to make the available information on the Web site. Another concern of public law librarians is that, although much primary law (statutes, court opinions, and regulations) is available on the Web and consequently relied on by the public, it has neither the authority nor the authenticity attached or guaranteed. Secretaries of State are beginning to jettison their print versions of administrative rules and codes in favor of digital versions that can be accessed from the Web sites. There is little appreciation outside of the library world of what this can mean in the future.^[123] The permanent preservation of born-digital legal materials is another concern of the profession.^[124]

The continuing escalation of prices of legal materials has been a problem for all law libraries for years. Those book budgets that have not been routinely raised to accommodate book inflation have been decimated. The serial nature of the law collection, which is based on the continuation and updating of most of the items, means that those books that cannot be updated are no longer of worth and generally have to be removed from the collection.

Another concern of public law librarians is that, as more and more of their services are provided to customers who do not actually walk into the library, there could be a

perception that fewer and fewer people are actually using the library. Statistics are somewhat more difficult to collect for validation purposes. It is known that clients without legal training, whether they are pro se litigants, students, or citizens who want to know what their rights are, require significantly more time to assist because of their unfamiliarity with legal materials.

Conclusion

Providing a balanced collection and competent staff to serve the wide variety of people who use the public law library is a significant challenge. Clients may be attorneys or judges, but they could just as likely be angry, confused or desperate lay people who have every right to access the law but just do not know how. The public law librarian is committed to providing access, but cannot interpret the law or suggest legal advice. Managing the public law library requires a delicate balancing act.

Public law libraries are challenged by trying to manage their facilities in an entrepreneurial fashion when they are significantly restricted by government barriers. Continuing price increases have forced many public law libraries to cut back on their collections. Subscribing to electronic databases does not help with budgeting, since they are as expensive as their print counterparts, if not more so. Nevertheless, the public law library with nimble management continues to be a vital and valued part of the judicial system.

Law Literature and Its Users

Penny Hazelton

Gallagher Law Library, University of Washington, Seattle, Washington, U.S.A.

Abstract

This entry introduces the legal system of the United States by describing the branches of government that create the laws of a civilized society. These sources of law are interrelated and must be understood in order to find answers to legal questions. The law has characteristics that impact the work of the researcher, including the division of law into primary and secondary authority, the doctrine of precedent, the need for both stability and change in our laws, and the multiplicity of sources of the law. The types of legal materials are then described, along with examples followed by a section on legal publishing and the formats of legal information. Finally, the entry concludes with a description of various types of users of legal information.

INTRODUCTION

In a very real way, the law is nothing more than words. But it is really more than that; these words articulate the policies and rules that govern our behavior. These words are published in print and digital format, and they are accessible at libraries and through commercial and free sources on the Internet.

The diversity of sources of the law contributes to the complexity of answering even simple legal questions. Over time, sophisticated research and finding tools were created—first in print and then electronically—to help locate this vast body of legal information. An understanding of the interconnectedness of legal materials will aid in the use of these multiple sources of law.

This entry will describe our legal system in basic terms, followed by a discussion of the sources of law and the characteristics that influence its use. The next section covers some basic information about the publication of legal information and the various commercial and governmental entities that make legal information available. Although most people now access legal information in electronic form, we will also cover print sources.

Primary authority, secondary authority, and finding tools make up the legal literature. Each has a special role in legal research. And because everyone creates and/or is subject to our laws, we will address how citizens, lawyers and other legal professionals, law students, and the general public navigate the legal system.

THE LEGAL SYSTEM

The law comes from the legislative, executive, and judicial branches of government. The law is designed to shield citizens from both tyranny and lawlessness, to protect freedom, and to enable society to conduct its affairs. Our

legal system is complex because in the eighteenth century the founders wanted to distribute the power of lawmaking in a balanced way so that no one part of government could take complete control. Our legal system in the broadest sense is composed of branches of government with powers to make, interpret, and enforce the law. It also includes a legal profession responsible for advising government and representing litigants in their conflicts with the government or others.

It is important to note that the U.S. Constitution^[1] created a federal system. Some powers are centralized at the federal (national) level, and some powers in the hands of the states. And within individual states there are cities and counties that have lawmaking powers—some more than others. In the United States, we also have Indian tribes that have a certain amount of sovereignty due to both treaties and federal legislation. Thus, the law on any particular subject can come from one or more governmental units. As we will see in the following, this raises some special challenges for the legal researcher.

We use the word law in many senses. Some legal literature contains the law—the legislation, administrative regulations, and court decisions we live by. But we cannot understand the literature of the law until we understand how law is created, and by whom.

The legal system of the United States is called a common law system. In a pure common law system, the law is derived from the decisions of judges when specific cases come before courts. Under what we call “precedent” (or *stare decisis*), judges are to follow those earlier decisions so there is consistency among these decisions. Other countries, such as Germany and Japan, are called civil law countries; their legal systems rely on codes or constitutions. It should be noted, however, that in the United States, law is also created by the executive and the legislative branches of government as described in the following. Although we call the United States a “common law”

country, as we will see in the following, one begins his or her research not with cases, but with legislative and administrative codes. And one state, Louisiana, is based on civil law because of the influence of the French Napoleonic Code.^[2]

SOURCES OF LAW

In the democratic form of government in the United States, the power to make law is not centralized. For example, copyright law is governed by federal law because of an explicit delegation in the U.S. Constitution, “To promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries. . .,” U.S. Constitution, Art. 1, Sec. 8. On the other hand, creation of laws to regulate families and domestic relations are historically a matter for the states. This is reinforced by the tenth amendment, which states that “[t]he powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people.” U.S. Constitution, Amend. X. As a general matter, legislative bodies pass laws with broad application to everyone. They do not decide disputes between individual parties; this is done by judges. This distributed model of lawmaking among various branches of government and at all levels of government makes it essential that the researcher understand all of the sources of law and their interrelationships.

Discussion of the sources of law in this entry is necessarily generalized, since different levels of government in the United States (federal, state, Indian tribe, city, county) may have slightly different specific relationships. For example, the state of Nebraska has a unicameral legislature, not a bicameral (house and senate) legislature like all other states. The Nebraska legislature’s homepage includes an excellent explanation of their one-house legislative system.^[3] So although we will use the federal government as an example of lawmaking in the United States, the concepts described in the following apply at every governmental level.

Constitutions and Charters

Our legal system was created by the Constitution of the United States as the supreme law of the land. The U.S. Constitution is a single document, but it is also the basis for the vast body of laws that make up the American legal system. As a legal document, a constitution or charter creates the form of government and allocates power to the various branches of that government. For example, the U.S. Constitution created three branches of government, each of which has specific duties and responsibilities. Some of these responsibilities involve making or interpreting the law.

All branches of government must be certain that their work does not violate the constitutional framework. In that sense, all lawmaking activities must conform to the requirements of the constitution. No branch of government can change its own lawmaking responsibilities unless such changes are constitutional. A reallocation of power among the branches of government can only happen if the charter or constitution is amended or changed. However, many legal disputes are between the branches of government (Congress vs. the executive branch, for example), or between the federal and state or local governments (federalism issues).

There are constitutions at all levels of government, but in cases where a state constitution conflicts with the U.S. Constitution, the latter is always supreme.^[4]

Legislative Branch

The legislative branch of government has the authority to make, amend, and repeal laws of general application. This power is granted by a state or federal constitution or charter. Many legislatures meet once a year to consider new laws that should be enacted. Legislative bodies propose new or amending legislation, hold hearings before committees with jurisdiction over certain subjects, debate the merits of proposed laws, and vote to pass or reject those proposed laws. The constitutions in about one-half of the states provide for the people to make laws directly through the initiative and referendum processes. For an excellent book on this subject, see Williams,^[5] also published as issues 3 and 4 of volume 26 of *Legal Reference Services Quarterly*.

As part of the checks and balances in our form of government, the president of the United States or a state governor has to agree to these new laws or veto the passed legislation. Administrative agencies, part of the executive branch, are often granted lawmaking powers by statute, which is called “enabling legislation.” The laws passed by administrative agencies are called “rules” or “regulations.” In some cases, courts void agency regulations when they conclude that the agency acted outside the boundaries of its delegated authority. Furthermore, the judiciary can limit application of legislation and regulations if the scope exceeds the powers granted by the Constitution or charter that formed the government.

Judicial Branch

The judicial branch of government includes the court system, which adjudicates disputes. Judges are either appointed or elected to serve in trial and appellate courts at all levels of government. Their job is to enforce legal rules by hearing cases from parties who cannot agree on the solution to their own conflicts (civil cases), or who are being charged with criminal activity that represents a violation of a federal or state statute.

Each court has jurisdiction,^[6] or the “power, right, or authority” to take action over certain types of cases. Courts also have rules of procedure that must be followed. Normally there is a trial court level, usually an intermediate appellate court, and finally the highest appellate court (or court of last resort). An appellate court is a court having jurisdiction to hear appeals (a request to a higher court to overturn the legal ruling of a lower court) and to review the trial court procedure. Legal terms have been defined by the American Bar Association on their website.^[7]

Judges decide cases at all levels, but in most jurisdictions, only appellate court decisions are published and made available to the public. Cases can be appealed from the trial court to an appellate court to review issues of law; an appellate court must accept the facts as determined at trial. Thus, trial courts handle the vast majority of disputes; only a small proportion of cases are reviewed by a higher court.

Judges can interpret legislative enactments, can declare legislation in violation of the constitution unconstitutional, can decide issues of law based on common law (non-statutory) principles, and may review administrative decisions and rules. Judicial decisions can have wide precedential impact, as the rule of the case may be applied in later similar circumstances involving different parties.

Executive Branch

The executive branch of government is charged with implementing and enforcing the law, as well as operating of the government. Chief executives—the president or a governor—actually have limited power to create law through executive orders. Administrative agencies—the primary lawmaking entities of the executive branch—are created either by the executive (often through “Reorganization Plans”^[8] or by legislation to implement government policy).

The role of the executive branch of the federal government in lawmaking was quite limited until the 1930s when Congress, due to the Great Depression, created several new independent, regulatory agencies. Added to the more traditional executive agencies (i.e., the Department of State or the Treasury), the body of regulations that governs behavior of our citizens has grown tremendously in our complex society. Essentially, when Congress creates a law, say, to clean the air, some governmental agency is put in charge of making this happen. Every government with an executive branch (i.e., city, county, state, Indian tribe, or federal) has administrative agencies responsible for the implementation of its initiatives and priorities. The implementation of governmental policy will be through the issuance of rules (regulations), and often through interpretations of those rules.

Administrative agencies have broad powers, but when power is delegated by legislation, it is constrained by the

legislative branch. And because the agencies are part of the executive branch, the president may restrain the power of agencies. For example, there usually is much less regulation of business by the Federal Trade Commission during Republican than Democratic administrations. Furthermore, in cases of arbitrary and capricious action on the part of an agency, its regulations can be reviewed by the judicial branch. Again, we see the checks and balances of lawmaking as outlined by the U.S. Constitution at work.

International Law

Public international law governs relations among nations and as such regulates a wide range of transnational activities. Agreements between and among nations, normally called treaties, can govern a nation’s behavior in the international sphere. For example, the United States might sign a treaty about the treatment of prisoners taken during wartime (the Geneva Convention^[9]) or governing the use of space for various purposes (the Outer Space Treaty^[10]).

The executive has the power to sign treaties with the advice and consent of the Senate.^[11] Again, we see the checks and balances that disperse power throughout the branches of government.

Common Law

Our system of law in the United States is based on the common law system of England. Before the American Revolution, the customary laws of England formed the basis of the laws in the United States. These customs were the rules that governed behavior, ordinarily determined by a judge hearing a specific case before the court. Once the U.S. Constitution was written, it took many years for the young federal and state governments to enact their own laws. During that time, when conflicts or disputes arose, they were often settled by courts that applied common law doctrine. Today things are much more complex: the legislative, executive, and judicial branches of our federal, state, and local governments create the laws that govern our rights, obligations, and behavior.

An example of a common law rule is the no-longer-held view that when a woman married a man she gave up her individual legal status.^[12] Before judicial opinions and state legislation changed this common law doctrine in the early twentieth century, a married woman did not have individual legal standing and, for example, could not bring a lawsuit, hold property, nor sue her husband.

It is not unusual for a federal or state legislature to adopt judge-made law. At the same time, it is not uncommon for Congress or state legislatures to pass laws that have the effect of overturning judicial decisions, which is fine unless such legislation violates federal or state constitutional law.

CHARACTERISTICS OF THE LAW

Several characteristics of the law influence the use and interpretation of legal information and profoundly affect the tasks of the legal researcher. An understanding of these factors will help researchers understand the complex nature of the law, and learn to effectively use legal research tools.

Primary and Secondary Authority

All law and law-related information is classified in one of two ways. Either the information is the law or it is not. Primary materials contain the law, which is found in legislative enactments, judicial decisions, administrative rules, regulations and decisions, and in international treaties or agreements. Because these materials are “the law,” we say they must be followed and therefore represent primary authority. Researchers need to rely on the law when answering legal questions, so the researcher’s main task is to locate relevant primary authority.

Secondary authority discusses, evaluates, criticizes, or otherwise comments on the law. They analyze and synthesize legal doctrine, analyze policy, refer extensively to primary authorities, operate as finding aids to locate legal information, and are a great source for summaries, special terminology, and context of specific legal subjects.

This classification of legal information drives the research process. Secondary sources can help lead the researcher to appropriate and relevant primary materials when the primary materials themselves may be hard to search or are otherwise elusive. Understanding what types of legal materials can be relied upon to answer legal questions is essential to understanding the function of law in our society. Here, the interrelationships among the law created by different branches of government also come into play. The researcher must know, for example, which primary authority to rely on when the holding of a court decision in Connecticut appears to conflict with a Connecticut statute.

Precedent

Another characteristic of the law is that the doctrine of precedent applies to judicial opinions.^[13] *Stare decisis*, a Latin phrase, means let the decision stand. This doctrine of precedent requires a judge to apply the same reasoning in deciding a current case as that which was used in previous cases coming from higher courts in that jurisdiction involving the same facts and legal issues. Among the forms of primary materials, judicial opinions are issued from several levels of courts within the federal, state, city, county, and Indian tribal governmental structures. The theory underlying the doctrine of precedent is that society, through its legal rules, should treat people the same if they

are similarly situated. Thus, legal researchers look to past court decisions to find out how similar cases would be decided today.

Judicial opinions are either mandatory (binding) or persuasive authority. The rules established in judicial opinions *must* be followed by courts when they are mandatory authority. The rule of the case is mandatory in courts in that same jurisdiction at a higher level. So, for example, in a current case dealing with the standard of review in the licensing of a limousine driver, the Oregon Court of Appeals must follow the rules established in earlier cases dealing with this same subject decided by the Oregon Supreme Court. But an Idaho Supreme Court does not have to follow a rule made by the Oregon Supreme Court. That is, Oregon Supreme Court cases are not mandatory authority in Idaho courts.

As a general matter, appellate courts at the same level, in the same jurisdiction, will say they follow earlier decisions from their court involving the same facts and issues. Using the same example as earlier, the Oregon Court of Appeals is likely to follow earlier decisions from that court involving the same facts and issues. However, because it is the *same* court—rather than a higher court—it really is not compelled to do so.

The rule of the case is clearly the linchpin to the determination of the authority of the case—whether it is mandatory or merely persuasive. The rule of the case is the legal rationale or reasoning used by the judge in making a determination of who wins and who loses in the dispute before the court. Lawyers often disagree about the rule in the same case, throwing into controversy whether that case is mandatory, and whether the rule must be followed by the current court.

Persuasive authority is just that—rules established in court opinions that *may* be used by lawyers to persuade a court to adopt a certain ruling in a case. Cases outside the line of mandatory authority are merely persuasive. For example, an Idaho court will never *have* to follow the rule of a case from Oregon, but the Idaho court might like the Oregon rule and decide to apply it in Idaho.

This theory of precedent is important because a researcher needs to cite the strongest possible authority for any proposition. The weight of authority of a court decision—that is, is it mandatory or persuasive authority—is relevant to the search for case law and to an evaluation of those research results. The doctrine of precedent guides our research and requires that the huge body of judicial opinions decided since the establishment of our country must be available to the researcher. We do not discard old court decisions because a 200-year-old opinion might still reflect the rule of law in a particular area of law.

Stability and Change

There is great tension in the legal system between the need for stability of law so that outcomes are predictable, and

the need to change in order to reflect the world we live in today. The doctrine of precedent, discussed earlier, makes it clear that the legal system looks to earlier court decisions to help determine how a case should be decided today.

But what if the world changes and the old rules no longer work? As we discussed earlier in this entry, in nineteenth-century America under common law rules, when a woman married, her legal status as an individual was merged with her husband. She could not bring a lawsuit because she was not considered an individual under the law.^[12] Obviously, this rule is very out of balance with our current society. So, how did this rule change? The subject—the legal status of a married woman—is a matter of state law. The rule changed because legislatures (through new laws) and courts (through their opinions) reviewed the reasons for the rule, found that those reasons violated public policy, and created new rules that did not disable the legal rights of a woman who married.

The rules we live by in our society—the law—must be able to change. But if societal rules were in a constant state of flux, we would neither know how to act nor be able to predict the consequences of our behavior. A society without rules is anarchy.

This characteristic of the law—that it needs to be predictable, yet flexible—has important consequences for legal research. First, you must have access to the most current sources of law. Second, you must also have access to older sources of law. Third, you must understand that law exists within the context of current societal norms and values. Understanding research in economics, sociology, psychology, history, politics, medicine, technology, and natural science—in short, all disciplines—helps a legal researcher appreciate forces that might operate to change the laws.

Multiplicity of Sources

The final characteristic of the law that impacts legal research is the sheer number of sources. On the federal level, all three branches of government make laws. In addition, every state, Indian tribe, city, and county has lawmaking powers. And in most cases, states, Indian tribes, cities, and counties have a legislative branch, a court system, and an executive branch. All have lawmaking responsibilities and powers.

When a person wants to know what the law is on a certain subject, there is very rarely one source to look to for the answer. A researcher may have to research federal, state, and local law (at the city and county level we use the term “ordinances”) to advise a client on, say, a land use question that involves federal and state wetland legislation and interpretative court decisions, and city/county ordinances. Furthermore, we are not likely to know whether a legislative act, a court decision, or an administrative rule will be dispositive. This means that a legal research

project must be planned carefully, and that the researcher must understand how all the sources of law fit together.

TYPES OF LEGAL MATERIALS

In order to understand the literature of the law, knowledge of the types of legal materials created is essential. Each type plays a role in solving legal problems. Many legal materials are available in print and electronic formats. Because many electronic legal materials are based on the original print sources, understanding the patterns of print publication of the different types of materials can aid in the use of these documents in electronic form.

All legal information can be divided into two types—primary and secondary sources. Primary sources contain the law—the rules we live by. Secondary sources are *about* the law. What follows is necessarily an abbreviated overview of legal materials. Legal research textbooks are a rich source for further investigation.^[14–24]

Primary Sources

The law is contained in several different types of primary source material. Constitutions and charters, statutes, judicial opinions, administrative rules and decisions, and treaties are sources of the law. Each of these types of law derives their force from the powers delegated through the document that forms the government, such as the U.S. Constitution, a state constitution, or a city charter.

Constitutions and charters

As mentioned earlier, a constitution or charter creates the form of government and allocates power among the various branches of government. The checks and balances established in the federal constitution create complex interrelationships among the executive, judicial, and legislative branches of government. These relationships are important to remember when trying to solve legal research problems, since they affect the relative weight of the authority.

Statutes or codes

Once laws are passed, they are numbered sequentially by legislative session and made available as “slip laws.” A slip law is, simply, a single legislative act. These laws are chronologically published, and eventually organized by date in a compilation called “session laws.”

Because these session laws are not arranged by subject, they are time-consuming and awkward to use when a researcher wants to know the current law in a particular subject area. In order to make it easier to find the current law on any particular subject, the session laws are codified by the jurisdiction (i.e., federal, state, or local), which means they are arranged by subject. These “codes” or

“statutes,” as they are commonly called, are normally created by the government. They have excellent indexes and tables of contents to facilitate finding relevant laws. Most of these codes are published in both print and electronic formats by the government, but almost always also are published unofficially by commercial publishers. Whether published by the government or commercial publishers, the text of the code or statutes is identical, and both are considered reliable sources of the legislation.

Because the role of judicial opinions is often crucial to understanding how legislative enactments should be interpreted, commercial publishers created annotated codes. An annotated code includes the code itself, plus “annotations” that reference the history of the law, secondary materials that refer to the law, and cases that interpret the law. These annotated codes save the researcher a lot of time, since legislation, court opinions, and secondary sources on a particular subject are all gathered together in one resource.

Codes and annotated codes are updated by the session laws in order to be current. These updates occur at least once a year, but there is a trend to integrate the language of the session laws into the codes or statutes several times a year. Both Westlaw and LexisNexis update their digital versions within weeks after the passage of a new federal or state act.

The checks and balances incorporated into our form of government are evident as we look at the interrelationships between legislation, the constitution, the judiciary, and the executive. Legislation can be enacted on nearly any subject as long as it is within the grant of power by the Constitution. Legislation can change judicial interpretations of statutes or change a common law rule relied upon by a judge. Legislation can create or eliminate administrative agencies, as well as grant or eliminate power to implement the purposes of the legislation. At the same time, legislative enactments also are subject to the checks and balances of the Constitution so that no one branch of government would have all lawmaking power. In the famous decision *Marbury v. Madison*, 1 Cranch 137 (1803), the Supreme Court made it clear that the Court was the final arbiter as to whether a statute was constitutional.

Citation to codes or statutes is the shorthand reference lawyers use to refer to specific sections of a law. Citations to statutes or codes will ordinarily look like this: 28 U.S.C. § 1291 (2006). In this example, 28 is the title number of the law, U.S.C. is the abbreviation of the source of the law (*United States Code*), § 1291 refers to the section of the code containing your specific language, and 2006 refers to the year the USC was published. See the standard manual for citing legal materials for further explanation (*The Bluebook*, rules 12 and 13^[25]).

Judicial opinions

Court opinions are issued directly by a judge or panel of judges through an official court website. The first appearance

of a court opinion is called a slip opinion. Eventually, the opinions from that court are gathered together and published in a court report, or reporter. At this point, the slip opinion will be given a permanent citation. On the state level, as a general matter only decisions from appellate courts are published. And of those, fewer than half of the states publish their appellate court opinions in print under government auspices. The rest have contracted out this distribution of court opinions (unofficial reports) to a commercial vendor.

Court opinions are organized by jurisdiction, so, for example, all the decisions of the Washington State Supreme Court will be found in the official government publication called Washington Reports. One commercial publisher—West Publishing Co.—gathers appellate court opinions from several different states into what they call regional reporters. For example, the opinions of the Washington State Supreme Court can also be found in the Pacific Reporter, a series that includes cases from Washington and 13 other western states.

Most series of court reports number hundreds or thousands of volumes. Subject access to court opinions is through full text word searching in databases containing court opinions (free from government websites, and for a fee from publishers such as Westlaw, LexisNexis, and Bloomberg Law). The West key number digest system (available in print and on Westlaw) provides a comprehensive subject index to all state and federal cases. In addition, virtually all secondary tools analyze and cite freely to judicial opinions.

Citation of court opinions follows this form: *Princeton University Press v. Michigan Document Services, Inc.*, 99 F.3d 1381 (6th Cir. 1996). The names of the parties come first in the citation, followed by the volume number of the reporter where the opinion can be found (99), the abbreviation of the reporter containing the opinion (F.3d for *Federal Reporter* 3rd series), and the first page of the opinion (1381). The parenthetical contains the abbreviation for the court that decided the case and the year the opinion was decided. In the aforementioned citation, this case was decided in 1996 by the United States Court of Appeals for the Sixth Circuit. More details and other examples can be found in the standard work on legal citation rules, *A Uniform System of Citation*, commonly known as *The Bluebook*, rule 10.^[25]

Administrative decisions, rules, and regulations

An executive or administrative agency has two types of lawmaking power. One has characteristics of legislation, and the other has attributes of the way courts work. Writing rules and regulations to implement the mandate of the legislation to create clean air is one kind of lawmaking done by administrative agencies. The rule-making process is governed by the Administrative Procedure Act (5 U.S.C. §§500 et. seq. 2012), legislation that requires, among other

things, an opportunity for public notice and comment before rules and regulations can be finalized.

In addition, some administrative agencies have what is called quasi-judicial power. That is, agencies can interpret their own rules and regulations in a specific conflict between the agency and a citizen or organization. The resulting determination in this specific conflict is called an administrative decision or opinion. It is enforceable, and in certain cases the opinion can be reviewed by a court of law in the judicial branch of government.

Citation to agency regulations and agency decisions can be found in *The Bluebook*, rule 14.^[25]

International law

To solve legal problems with international issues requires consultation of treaties and other international agreements, as well as the relevant customary law. Decisions of international tribunals will also be relevant to many questions with international ramifications.

International legal research is unique and requires knowledge of many different sources of law than are used to research American legal issues. A good, current research guide will help the novice locate and use the needed materials.^[26] A new book on this topic by Winer, Archer, and Louis-Jacques would also be a great place to start.^[27]

Citation to international resources can be found by consulting *The Bluebook*, rule 21.^[25]

Secondary Sources

Information resources that discuss, evaluate, or otherwise comment on the law are called secondary sources. In some cases, secondary sources such as treatises and law review articles are cited by attorneys to support their arguments, and by judges in their opinions. Secondary sources are particularly important to the process of research as they can help shape the sources consulted by the researcher and help make the research more efficient by citing relevant primary authority. The many types of secondary sources play different roles in the research process. The following section describes the major types of secondary sources and explains where they are most useful. Someone who is researching a topic he or she is unfamiliar with should begin with secondary sources.

Books

There are several types of books published for legal researchers. Many are still available only in print, but more and more are available in digital format from legal publishers like Thomson-Reuters, LexisNexis, and Bloomberg Law, or nonlegal publishers like Oxford University Press and Cambridge University Press. Few recently published books are available at low cost or free through the Internet. At this point, some historical legal works are being

digitized by the Google Book Project. Gale's "Making of Modern Law" and HeinOnline's "Legal Classics" databases include many important eighteenth and nineteenth century legal works.

Citation to books and non-periodical literature is governed by *The Bluebook*, rule 15.^[25]

Scholarly treatises. The scholarly treatise is one of the most useful types of law books. These works are often written by legal academics, and reflect years of research and expertise in an area of law. There are one volume and multivolume treatises. Most are updated at least once a year, but some titles may be updated several times per year. The object of these works is comprehensive analysis and synthesis of legal doctrine in the subject matter of the book. They cite heavily to primary legal materials and other relevant secondary materials. For the novice legal researcher, they can be overwhelming since they cover their topic in great depth. Examples of scholarly treatises are the multivolume work, *Environmental Law* by Professor William H. Rodgers and *Cohen's Handbook of Federal Indian Law*, a comprehensive one-volume work. Both were originally published several years ago and are supplemented on an annual basis.

Monographs. Single-volume legal works on a narrow topic are called monographs. They can have a historical or current focus. They are authored by law professors and often rely heavily on footnotes and citation to legal primary and secondary sources. Most of these works are not updated at all. *Most Humble Servants: The Advisory Role of Early Judges* written by Professor Stewart Jay is an example of a legal monograph.

Practice materials. As the generic name suggests, these books are primarily written by and for lawyers. They tend to be very practical, rather than scholarly treatments of the subject. The best ones are updated at least annually, and may include sample forms and checklists. They also cite heavily to primary materials and other useful sources. A two-volume work written for Washington State practitioners, *Creditors' Remedies—Debtors' Relief*, authored by Professor Marjorie D. Rombauer, is an excellent example of the type of a secondary source written especially for lawyers.

Student texts. There is a whole genre of books published to help law students succeed in law school. These works cover the spectrum from glorified outlines to substantive one-volume works covering a specific law school course, like contracts or property. The latter, called Hornbooks, regularly cite to primary and other secondary legal materials as they summarize and synthesize the law. *McCormick's Evidence*, 7th edition, was published in 2014 and would be a great resource not only for students but also for the researcher who has no background in the

law of evidence. These works are usually updated with the publication of a new edition every few years. However, some have annual supplementation.

Books for the layperson. As is true in any specialized field, a wealth of publications can be found designed to fill the layperson's information needs. Do-it-yourself books in law abound as well. *How to Do Your Own Divorce*, *The Renter's Legal Guide*, and *Write Your Own Will* are examples of the types of books published to help the non-law-trained person with legal problems. Nolo Press specializes in law books for the layperson.^[28] Many people act on their own behalf or become pro se litigants because meaningful access to the legal system is not available. Books about the law that explain legal rights in a clear way can be very useful to those who want a basic understanding of the law.

Legal periodicals

There is an abundance of legal periodical literature in law of four distinct types. Periodical literature has been added to Westlaw and LexisNexis since the early 1980s, but the vast majority of academic law review articles have been digitized and are available on HeinOnline, a subscription database. Since the digitization process scanned articles using the pdf format, the materials in the HeinOnline databases look exactly like the print volumes with the added enhancement of full text searchability.

Access to this vast body of literature is through full text searching of the digital files as well as use of legal indexes such as H.W. Wilson's *Index to Legal Periodicals*, EBSCOHost's *Legal Source*, and Gale/Cengage Learning's *LegalTrac*. These indexes may be available on Westlaw and/or LexisNexis, as well as directly from the publishers.

Citation to periodical literature in law can be found in *The Bluebook*, rule 16.^[25]

Academic law reviews. Law is the only discipline in which articles written by law professors, attorneys, and other scholars or practitioners are selected, edited and published in student-run journals called law reviews. Every American law school has a general law review, and most have several specialized law reviews. For example, the University of Washington School of Law has a general law review called the *Washington Law Review* which publishes articles on all legal topics, and several specialized journals: the *Washington International Law Journal*, the *Washington Journal of Environmental Law & Policy*, and the *Washington Journal of Law, Technology & Arts*. Law schools subsidize their law reviews, so subscription rates are very low, at least compared to the journals published commercially for profit.

Published one to eight times per year, articles and student comments published in law reviews analyze and

synthesize the law. These works are heavily footnoted with references to all types of legal information and can be very helpful in the early stages of a legal research problem. Most articles are in the 30–60 page range.

Today, some journals are published only in digital form and are available through institutional, open access, digital repositories. More and more law schools are making all of their journals available on the school's website, and one can expect this will be the rule, rather than the exception, in the not too distant future.

Bench and bar journals. Periodicals published by judges' and lawyers' associations are generically called bench and bar journals. They may be published as frequently as monthly, or only annually. Virtually all the content is written by legal practitioners and judges. *The Colorado Lawyer* is an example of a state bar association's publication. The articles tend to be short and practical. They cite to relevant primary and secondary legal materials, but not comprehensively.

Membership in the bar association or judge's organization is usually required in order to receive copies of these journals. Many current issues are available in electronic form on the organization's website. Some titles are available through Westlaw, LexisNexis, and HeinOnline.

Commercial journals and newsletters. By far the most common delivery of scholarship in most other disciplines, commercial journals are far more rare in the legal literature. There are some; but they tend to be directed toward the legal practitioner. The articles are not very long, but most include reference to primary legal authority. The journals (called commercial journals because they are published by for-profit publishers) usually cover very specialized subjects of law. They are expensive, often costing several hundred dollars for an annual subscription. *The Intellectual Property and Technology Law Journal* published by Aspen (Wolters Kluwer) is an example of a commercially published journal.

Legal newsletters are very common in law and are often published to notify legal practitioners about current cases, legislation, and administrative actions that impact a specific legal subject. Most of these are commercially published, although a few are written and distributed by non-profit legal organizations. Most newsletters are available online. Good examples of newsletters are those issued by Bloomberg BNA (formerly the Bureau of National Affairs, or BNA). A comprehensive list of all legal newsletters can be found in the annual *Legal Newsletters in Print*.

Legal newspapers. Of course, information about the law can be found in nearly any type of newspaper. However, legal newspapers that specialize in legal content regularly make specific reference to legal authority, including citations, so the references can be found by the researcher. There are two national legal newspapers, and several

city/regional legal newspapers written for members of the legal profession. The *National Law Journal* and the *American Lawyer* cover legal issues nationwide, while the *Los Angeles Daily Journal* focuses on local and regional legal news. They cover very recent legal developments, analyzing various sources of law, policy, and other related disciplines. Most are published weekly or monthly. They are available through subscription in print, microform, and electronically.

Looseleaf services

As the law became more complex, practitioners needed access to all sources of law on a particular subject. Since most primary legal materials are published by jurisdiction and not by subject, a lawyer who practiced labor law needed to have access to federal and state legislation on labor law, federal and state cases on labor law, and all administrative activities related to labor law at the state and federal level—virtually thousands of volumes of law books.

In the 1940s, legal publishers created looseleaf services that included primary legal materials on one subject. An example is Bloomberg BNA's *Labor Relations Reporter*. This reporter includes all primary legal materials about labor law—statutes, court decision, administrative materials—along with checklists and analysis. Multivolume and updated on a weekly basis (and now available electronically by subscription), looseleaf services are some of the most sophisticated legal research tools published. Today, these “looseleaf services” are published online, and most users get the contents in digital, rather than print, format.

A comprehensive list of looseleaf services in law can be found in *Legal Looseleafs in Print*, published in a new revised edition annually.

Legal encyclopedias

Legal encyclopedias summarize and synthesize the law from judicial opinions and some federal statutes. The encyclopedias are organized by legal subject from A to Z and include analysis and citation to primary and secondary sources. There are two national encyclopedias, *American Jurisprudence 2d* (Am. Jur. 2d) and *Corpus Juris Secundum* (C.J.S.). These are a great source for an overview of a body of law, and they include references that cite cases, statutes, and other authority.

Commercial publishers have also created legal encyclopedias for some states. These can be very useful when dealing with issues of state law.

Legal encyclopedias are updated annually. In addition to print, they can be found in LexisNexis or Westlaw.

ALR

American Law Reports (ALR) include selected court/judicial opinions with an accompanying annotation or

essay summarizing the case law in all state and federal jurisdictions. The analysis is comprehensive as to the very narrow point of law which is the topic of the annotation. Updated annually in print, this set is also available electronically through a subscription to Westlaw.

Restatements

The American Law Institute (ALI) meets regularly to offer, in the form of the Restatements, general principles—and sometimes *recommended* principles—of law that are primarily driven by judicial decisions. The Restatements themselves are secondary authority, that is, they do not come from any governmental unit. However, when a state court adopts a particular Restatement, that principle becomes part of the primary authority—the law—within that jurisdiction. If many states adopt the language of a Restatement—sometimes with modifications, we should add—the Restatements help understand the general rule among the states. The Restatements are updated once a year in print and are also available by subscription on Westlaw and LexisNexis.

Citators

One of the most interesting research tools created in law is a method that permits a researcher to find out whether the rule of a specific judicial opinion (case) is still good law. Since a court ruling can be appealed to a higher appellate court, over time the rule of the case can be eroded or solidified by later court decisions. The first citator was created by Frank Shepard in 1873. Eventually, his work allowed the lawyer to check the authority of every published case from all jurisdictions in his Shepard's Citations series. Frank Shepard's surname became a verb, as all lawyers were taught to “Shepardize” all cases before relying on them.

Shepard's Citations are published by LexisNexis. Although still available in print, today Shepard's is typically accessed as part of a subscription to LexisNexis. Not only is Shepard's online easier to use than the print, but it is also much more current. To compete with Shepard's, Westlaw created KeyCite in 1997. KeyCite is an electronic-only citator and available only on Westlaw by subscription.

KeyCite and Shepard's Citations both operate also as integrated research finding tools. Once a legal citation to one relevant case or statute is known, these sophisticated electronic systems can lead the experienced legal researcher to many other relevant cases, statutes, regulations as well as many types of secondary authorities.

Case digests

The publication of court opinions chronologically by jurisdiction inspired the creation of another important secondary

source in the late 1800s—the West Digest System (sometimes called the “Key Number”) system. Subject access to court cases is facilitated by this gigantic outline of case law. Legal editors at West Publishing Company (now a Thomson Reuters affiliate) read each court decision and write a short summary of the various points of law made in the court’s opinion. Each summary is called a headnote, and each headnote in every case is assigned to a topic and key number in the West outline of the law. The headnotes, organized by a subject of law and then keyed to a specific point of the outline of that body of law, were then compiled in digests. It is easiest to think of the West key number digest system as a subject index to court opinions. The digests are organized by jurisdiction (individual states, regional groups of states, and by levels of federal courts).

Now, available electronically by Westlaw subscription and in print, the digest system provides controlled vocabulary subject access to all federal and state court decisions.

LEGAL PUBLISHING

Since branches of governments make the laws through legislation, judicial opinions, and administrative rules and decisions, you might expect that the government would disseminate and publish them. But you would be wrong. Some governmental units published their court opinions and legislation, but until recently, many others did not. And even when governments published their law, the materials were often published with a long lag time. Of all the types of legal information sources, administrative regulations are the only type that has typically been published by the government at the federal level, and sometimes by many states, without resort to a commercial publisher.

The role that commercial (for-profit) publishers have played in the distribution of the law and the creation of legal research finding tools has been critical to the success of the legal system and the legal profession. For example, at the federal level only the decisions of one court—the U.S. Supreme Court—historically were published by the government. Until the digital revolution of the late twentieth century, all other federal court decisions were published only by commercial publishers.

Commercial publishers add value to the basic legal information they produce by including case summaries, annotations, indexes, and other finding aids. They also create new tools that assist the researcher in connecting different types of legal information on the same subject. Legal literature is rich in tools that synthesize and analyze legal information and reference other relevant materials.

In the United States, historically there were over three dozen publishers who produced a wide variety of legal research materials for law of all kinds. The consolidation of the legal publishing market in the mid-1990s that resulted in three international corporations controlling the

publication of virtually all American legal materials, both primary and secondary, changed the face of American legal publishing forever. For the most comprehensive history of the legal publishing industry in the United States, see Svengalis.^[29] As of 2014, Thomson Reuters (Canadian), Reed-Elsevier (British-Dutch), and Wolters Kluwer (Dutch) accounted for the vast majority of the worldwide sales of legal information. In 2010, Bloomberg L.P., a New York mass media corporation, acquired the Bureau of National Affairs, the next to the last major, independent American publisher.

Issues in legal publishing today center around the consolidation of the market and the transition from print research tools to electronic databases. Inflation rates in legal literature have been three to four times the regular rate of inflation for the past 25 years. Stagnant budgets in law libraries of all kinds, combined with the availability of new research tools, have added to the stress all law libraries are under in this early part of the twenty-first century. Publishers’ experimentation with economic models that create the profit needed for the vendor, but at prices law libraries can afford, has been the predominant feature of the past decade.

Vendors who had an historical print business in legal publishing have faced this century with different issues than those whose primary products were electronic only. Digitization of the law by the governments that make the law—and making the law free on the Internet—have led to a proliferation in the number of companies creating new information products for the legal marketplace.

At this point, legal publishing is widely dispersed, but the tools most commonly relied on by the legal profession are still published by the historically large commercial vendors—most notably LexisNexis and Westlaw—whose electronic databases and print publications have proven to be reliable, current, and authentic.

Will only the best of the legal research tools come to the surface after some years of experimentation? Or will legal researchers of the future continue to have an unlimited number of research tools from which to choose?

FORMATS OF LEGAL INFORMATION

Primary legal materials—court opinions, statutes, and administrative rules and decisions—have been available in the United States for over 100 years in print. Published both by government and commercial groups, a sophisticated group of legal research tools emerged to aid the lawyer in researching a legal problem for a client. When laws enacted by legislatures were organized solely by the date they were passed into law, governments and commercial publishers created codes—current legislation organized by topic, rather than by date. When court opinions were published in sets by jurisdiction (Washington State, federal, U.S. Supreme Court, for example) and then by

date, enterprising publishers created massive subject indexes to all published court reports. When there were so many cases published on a particular area of law that it was hard to understand what rule to apply, practitioners and law professors wrote articles and books synthesizing and analyzing the doctrines. Finding aids such as legal encyclopedias, periodical indexes, scholarly treatises, Shepard's Citations, and the West Digest system were created to help lawyers locate relevant authority quickly.

Methods were needed to keep these print materials up to date. The pocket part supplement was created to update the work in the main volume. It slipped inside the back cover to remind users to update the main work. If the supplemental materials were so large that the pocket part would not fit in the back of the book without breaking the book spine, a free-standing paperback pamphlet supplement was used. Later books were published in binders that allowed old, outdated material to be removed and new material to be added. Looseleaf services, comprehensive as to one subject, were published and updated on a weekly or monthly basis with new material filed and older material discarded.

However, digital information and the Internet have changed the world of legal research completely. Mead Data Central introduced the first database of legal information in 1973 called LEXIS.^[30] For the first time, state court opinions were full-text searchable. No longer were lawyers limited to the indexes and tables of contents created by book editors to locate relevant information. Now a researcher could locate opinions written by a particular judge or find all cases on a specific topic. Revolutionary!

Within a few years, the major print publisher of American legal materials, West Publishing Company, introduced Westlaw to the legal profession. In the 1980s and 1990s, Westlaw and LexisNexis (as it is now called) worked to add content and sophisticated search features to their aggregated databases. The vendors urged buy-in from law firms by providing programs which allowed law firms to charge their clients specifically for computer-assisted legal research (CALR). And these vendors provided a significant discount to law schools who subscribed to their services for their students and faculty. Significant discounts were also negotiated with courts that contracted with Westlaw and LexisNexis.

A huge change occurred in the mid-1990s when governments started to publish their documents and other content on the Internet in digital form, free to all users.

By early in the twenty-first century, flat rate contracts for commercially published legal electronic content were standard in academic, law firm, court, and county law libraries. And most of this content was bundled at discounted prices, often taking into account the print subscriptions to the same material. E-book contracts to license the content of legal monographs were available from some publishers.

Today, most governments publish and distribute the law from courts, legislature, and executive agencies in digital

form on the Internet—at all levels of government. Their collections of legal information are rarely historically comprehensive. Furthermore, the navigational tools and access to this information vary tremendously from one website to another. While these free government websites are often excellent for access to current legislation, and court opinions, and administrative agency regulations and decisions, they lack the sophistication (and of course cost) of the commercially available research databases such as Westlaw, LexisNexis, and the recent competitor, Bloomberg Law.

Not all print tools have transitioned comfortably into the electronic environment. Many legal materials are still not in electronic form^[31] and even if they are, they often lack the functionality of the print materials. In particular, a legal research tool (i.e., treatise, monograph, code, or statute) with a hierarchical arrangement that relies on the context of the previous or following material can be very hard to read and understand when only in electronic form.^[32]

It is small wonder that law libraries that have a lot of print have been pressured on the budget side when trying to provide legal information in both print and electronic formats. With regards to primary authority from the legislative, judicial, and executive branches, today most law libraries receive this in digital format. Treatises, on the other hand, are still primarily acquired in print. With law reviews now accessible on HeinOnline and an increasingly number of law schools making their journals available for free (with articles in .pdf), more and more law libraries are canceling their print subscriptions to law school journals.

Two other important issues stand out in this time of transition to electronic materials. The first is how to handle the preservation of legal information that is born digital—and never has a tangible, print equivalent. After nearly 20 years of born-digital information being published and disseminated on the Internet, the amount of this information that is no longer available at all is staggering. The problem is that no one knows how much legal information is really gone forever. Many organizations have identified this as an important problem, but only piecemeal solutions have been offered to date. The American Library Association's Government Documents Roundtable^[33] and the Government Documents Special Interest Section of the American Association of Law Libraries^[34] both have strong interests in fugitive and born-digital government publications. And many academic law libraries are creating permanent digital repositories of important materials, primarily their law reviews and articles published by their faculty.

The Legal Information Preservation Alliance (LIPA) is working on several projects to preserve print and born digital legal information.^[35] Another consortium of law libraries and other legal agencies—perma.cc—is acting to preserve the content of links to the open web which are cited in legal documents.^[36]

The second problem relates to the authentication of legal information. Although most legal information is now published on the web by the issuing government agency, most official websites disclaim the legal authority of what they include on the website. Sometimes, the user is referred to a print product. In many cases, there is no print equivalent. The American Association of Law Libraries (AALL) took the lead in the concern about this topic and published a ground-breaking paper, *State-by-State Report on Authentication of Online Legal Resources*, in 2007.^[37]

As a result of this advocacy, the National Conference of Commissioners on Uniform State Laws appointed a drafting committee and approved for enactment in all states a new uniform law called the Uniform Electronic Legal Material Act (UELMA). UELMA was approved by the Conference in 2011, and to date 12 states have enacted its provisions. This law has three purposes: 1) to guarantee the authenticity of legal documents produced by our governments, 2) to preserve this same legal material in perpetuity, and 3) to provide for permanent public access to these legal materials.^[38]

USERS

Our society was founded on the principle that the rules we live by—the law—must be accessible in a real way to everyone. Branches of governments create the laws, but until recently have not consistently made these laws available. The very best legal research tools for locating primary and secondary legal authority historically were available through commercial publications and databases, and often at high cost. This is one of the reasons that law libraries—especially those open to the public—are important.

Many people are interested in the law. Lawyers, judges, paralegals, and law librarians use legal information to answer questions for clients and library users every day. Law students learn how to search for legal information and how to apply the rules they find to specific problems. Students of all kinds—K-12 to graduate students—have questions about the law that are raised in their classes or through what they learn from their friends, parents, news, TV shows, or the Internet. Members of the public care about how the law applies to their daily lives, and some attempt to represent themselves in family law, landlord-tenant, or other disputes.

Ideally, primary sources of law—court opinions, statutes, administrative agency regulations and decisions, and treaties—would be widely available, in both print and digital format. However, a person's interaction with just the primary material is likely to be quite unsatisfactory because of the complexity of our legal system and the different levels of governments involved in the most simple questions. Reading a single statute and several cases interpreting that statute will rarely answer a legal question.

And the publications that contain the law itself do not necessarily refer to all of the types of legal materials that might be relevant to a specific inquiry.

These factors make the process of legal research complex, even for sophisticated lawyers or judges. Thus, each group of people who use legal literature will interact with legal resources in different ways, potentially using very different research tools in the process.

Lawyers

Members of the legal profession arguably are the most intense users of legal information. Most legal research tools have been designed to be used by lawyers who need very current and comprehensive information. A lawyer needs to be able to locate and understand applicable sources of law to address clients' issues, and be aware of the research tools he or she can use to answer those issues.

Do all lawyers regularly do legal research? No. Law firms are no different than other organizations. There are different responsibilities for different levels in the hierarchy. Size of the law firm also matters. A lawyer in a solo or small firm is more likely to do legal research throughout her career than a more senior lawyer in a large multinational law firm. Newly hired lawyers, usually called associates, handle more of the research done in large law firms. The more senior the lawyer in a large firm, the more likely they are to be finding and keeping clients and advising clients based on the research done by more junior lawyers. A senior lawyer is also much more knowledgeable about what the law is in narrow, specialized areas of legal practice. While the more experienced lawyer must keep that knowledge current since the law is always in flux, their expertise means they do not resort to the use of legal research tools very often.

In a similar vein, law clerks hired to work for judges for 1- to 2-year terms perform most of the research to support the work of the judge. Over time, judges develop a wide expertise in the matters that come before the court. And lawyers who are advocates before a judge provide written briefs and other filings that contain the research on which their legal position is based.

Law school faculty are lawyers. Part of their job is to write and publish scholarship in areas of their expertise. Many do their own legal research. And many use law librarians and/or hire research assistants who are current law students.

In law practice, legal research is also performed regularly by law librarians and paralegals. These professionals often do research which is outside the expertise of a practicing lawyer. Perhaps information is needed for statistical or economic data or other nonlegal topics. Or a highly specialized database or resource that is not familiar to the lawyer may be consulted.

Law librarians in court, county, academic, and firm law libraries (many of whom have law degrees) work directly

with lawyers to acquire and manage the legal resources needed to perform research, and to plan and arrange training on research tools for lawyers. The national professional association for law librarians, the American Association of Law Libraries, has an excellent website that includes information on education and careers in law librarianship.^[39] For an example of a special program to train lawyers who want to be law librarians, see the University of Washington Information School's website.^[40]

Successful legal research by lawyers and other professionals requires a research plan or design that takes into account the financial resources of both the client and the firm. Unless the area of law is very familiar to the researcher, secondary sources are very likely to be used early on in the research process. Research in books, periodicals, and/or encyclopedias will give an overview of the topic, help identify and clarify the issues, identify terminology that will help locate other relevant materials, and analyze and synthesize different sources of law over time on the topic.

The smart and efficient legal researcher will then select from a wide array of print and electronic research tools to begin the search for the primary materials that respond to the legal question. Many times, cases, statutes, and other relevant primary legal materials are identified initially from secondary sources. Armed with a more thorough understanding of the area of law and citations to specific primary materials can shorten the research project significantly.

The lawyer with expertise is more likely to consult comprehensive, current publications like online databases, looseleaf services, or government Web pages to be sure her knowledge is still current.

Every research project is different. If we knew the answer to the question, legal research would not be necessary! A few studies have been published that survey how lawyers actually do legal research. You will find a list with an abstract of each study in the appendix to this entry.

Overall, lawyers and other members of the legal profession use the widest possible array of legal information tools—from the large subscription databases (Bloomberg Law, LexisNexis, and Westlaw) to print treatises to the free and low-cost information found on the Internet. In recent years, in order to reduce the cost of research and even the playing field as between solo practitioners and large law firms, many state bar associations license a comprehensive legal database for all of their members. For example, the Casemaker database has been licensed for use by all members of the Washington State Bar Association, while Fastcase is the research database available to members of the Oregon State Bar.

Tools that permit lawyers to locate the most current statute on a particular subject, to easily determine if relevant judicial opinions are still good law, to have all important and current information on a particular subject, and to know the relevant law they have found is authentic and

official are essential if lawyers are to carry out their ethical obligations to their clients.

Law Students

The legal literature created specifically for law students is that which is centered around the courses offered in most law schools. Outlines, Nutshells, and Hornbooks are published specifically to help law students learn the material for their classes. These works range from simple outlines to one-volume works like those in the West Hornbook series. These materials can also be useful for lawyers researching in an area of law with which they are unfamiliar, and, to a lesser extent, for members of the public who are trying to understand a body of law.

Law students for the most part read the law as it is published in casebooks for each of their courses. Many legal subjects taught in law school are based primarily on judicial opinions. Some courses, such as tax and commercial law, rely more heavily on statutes. So the first exposure law students have to the law is not to read relevant cases and statutes directly from the primary legal materials (i.e., court reporters and codes) themselves.

This practice of excerpting primary material and repackaging for law students is one of the main reasons why courses in legal research are taught in all law schools. Otherwise, students would not be exposed to the array of research tools they will need when they begin practicing. Student use of the legal research tools created for lawyers is pretty minimal unless the student takes a seminar course in which he or she must write a paper, writes an article as part of their membership on the law review, fulfills an analytical writing project required by many law schools, or works in a clinic or law firm while in law school. Even for students who must research and write a significant paper, limited exposure to the vast array of legal information resources available is the norm. Legal research courses offered in the first year, and advanced research courses during the second or third year of legal education, introduce students to many more of the available practitioner tools.

Access to LexisNexis, Westlaw, and Bloomberg Law for all students and other members of the law school community is negotiated in a flat-rate contract with the vendors and paid from the law library budget. The educational discount is significantly lower than commercial rates. The vendors provide professional staff from their offices and hire law student representatives to train and work with students, faculty, and librarians at each law school.

Several smaller legal databases such as Loislaw, VersusLaw, Fastcase, and Casemaker may also have educational contracts to which many academic law libraries subscribe.

There are several challenges in providing law students with the legal literature they need to succeed as a law student and then as a practicing attorney. Research tools

are changing all the time, and proficiency using one tool today does not mean proficiency forever. Right now a bewildering array of legal research tools are available, making the choice of any specific tool more complex. Does the free government court website have the coverage I need, or do I need to use a large and comprehensive commercial database? Do I need to use sources other than LexisNexis or Westlaw? How can I evaluate the information found on the Internet?

The Google generation thinks it knows how to use electronic databases. But their LexisNexis, Westlaw, or Bloomberg Law searches must yield comprehensive yet precise results, and most law students find their generic Internet search skills are not adequate to the task. All of these challenges have as their backdrop the need for law students to understand the sources of law and the role that secondary legal literature plays in their research projects, as well as the need to critically evaluate what they find.

Public

Continuous and permanent access to legal information is at the heart of a democratic society. The Internet has made widespread distribution of the law a reality for anyone with an Internet connection. But lawyers and law librarians know that just adding judicial opinions or new statutes and administration regulations to the Internet does not create equal access to justice.

Members of the public who need to write papers or do presentations for class or other organizations have benefited tremendously from the large amount of legal material on the Internet. Together with libraries that provide access to books and journals on many law and law-related subjects, many people who wish to understand an area of law can do so. However, the lay person who decides to do their own legal research for their own legal problem can face many obstacles. The person who represents herself is called a pro se litigant.

While the wide array of primary legal information distributed for free through government websites is to be applauded, access to the *words* of the law is not enough for people who do not understand the sources of law, the types of materials published, and how the characteristics of law impact anyone trying to find an answer to a legal problem. A judicial opinion available on the Internet may have been overruled (i.e., changed) by a higher court. But the low-cost or free source on the Internet usually will not note this change. And if a person reads this case and thinks the rule of the case governs their problem because they do not know about the overruling decision, easy access to this judicial opinion is misleading, to say the least.

Many organizations are very concerned about the issue of the self-represented or pro se litigant and about the growing number of people who simply cannot afford the legal services they need. State bar associations, law libraries, publishers, and legal aid groups are widely involved in

the Access to Justice movement. To address these concerns, many organizations have created in-depth resources to help the pro se litigant navigate through the legal system and perform the legal research necessary to answer for his or her problem. But such a person must work hard to locate and understand how to use relevant materials.

Websites and print resources abound that can assist the self-represented litigant. One of the best general sites is the Nolo Press website which includes definitions of legal terms, summaries of types of legal problems, forms, and books on common legal issues.^[41] The Maryland State Law Library maintains a really excellent website for pro se litigants in Maryland that should serve as a model for other states.^[42] The National Center for State Courts has a resource guide for self-represented litigants that links to various projects in all 50 states.^[43]

The best advice to a member of the public who is interested in doing legal research is to direct them to secondary sources that explain the legal system, the interplay of the various sources of law, and the publications containing legal information. Critical evaluation of Internet sites that include legal materials is a very important skill to master.

Law libraries open to the public can be found in many counties and many law schools. Legal research texts, various websites, and even this entry can give members of the public the overview and background they need to successfully research a legal issue. A good example of a basic research guide was written by the Legal Information Services to the Public Special Interest Section of the American Association of Law Libraries.^[44] While members of the public need access to the law itself (the primary legal materials), they also need resource guides that are specific to the subject matter or court they must understand. In particular, the many books written specifically for lay people about the law can be most helpful. And the texts written for students who are studying the law—nutshells, outlines, and West's Hornbook series—can be very useful as well.

CONCLUSION

Legal literature, once the domain of the commercial publisher, is now found in a vast array of different sources—free and expensive; print and electronic. Any one type of legal information, such as the current legislative code for the state of Washington, can be located in different print and electronic sources. Understanding the legal system, the sources of law, the interplay of those sources, the characteristics of legal information within our legal system, and the nature of legal publishing provide the essential knowledge needed to use and understand the legal literature of our time.

The law changes constantly, and the challenge for any legal researcher is to find the most recent rule of law

affecting a specific problem. Since the research tools themselves are undergoing constant reinvention, the legal researcher also needs to be a lifelong learner who is willing to keep up with the new technology and the changes in favorite legal research tools. Methods of access to legal information will continue to change, but the underlying framework of our government and the decentralization of lawmaking are constants that will continue to bring stability to the process of legal research. Legal literature is shaped by these principles, and users must continue to demand high-quality, reliable legal research tools.

APPENDIX: HOW LAWYERS CONDUCT LEGAL RESEARCH

Research to Locate Studies and Descriptions Written by Carissa Vogel

Cohen, M.L. Research habits of lawyers. *Jurimetr. J.* **1968–1969**, 9, 183, 189–192.

Abstract (focusing on the above cited pages): Cohen briefly discusses three surveys conducted from 1965 to 1968 on the research habits of lawyers. The first survey Cohen discusses is one he conducted in 1968 looking at 25 small law offices in Philadelphia. This survey was focused on the materials contained in the firms' law libraries. Next, Cohen discusses an interview survey of 100 lawyers undertaken by the Missouri Bar. Cohen notes the results and the Bar's interpretation of the data it collected. Lastly, Cohen reviews a survey of 500 lawyers that he conducted in Philadelphia in 1965. He discusses the resources most often used by lawyers and the kinds of law being researched.

Cole, C.; Kuhlthau, C. Information and information seeking of novice versus expert lawyers: how experts add value. *New Rev. Inf. Behav. Res. Stud.* **2000**, 1, 103.

Abstract: This entry presents the results of a pilot study of 15 lawyers at various stages of their career. Concepts of task, information, and information seeking as viewed by novice and expert lawyers are examined in order to concentrate on adding value to information collected for a client or case. The authors develop a four-point arc related to value adding and suggest that it can be used by novice lawyers trying to understand and solve task-related problems. The entry was presented at the *Third International Conference on Information Needs, Seeking and Use in Different Contexts*, Goteborg, Sweden, 2000.

Estes, M. Law librarianship research needs survey. *PLL Perspectives*. November–December **1991**, 3 (2), 11–14.

Perspectives is a newsletter from the Private Law Library section of AALL. The table of contents for all the issues can be accessed through <http://www.aallnet.org/sis/pllis/newslett/newsletter.asp>. Visit your nearest law library for articles which are not yet available online.

Gilliland, K. Abstract, the research habits of lawyers. *Law Libr. J.* **2003**, 95, 719, 722–723.

Abstract: Gilliland describes her research grant project, which tabulated and analyzed the data collected in a 1995 survey by Morris Cohen, Penny Hazelton, and Patricia DeGeorges "to test some of the basic assumptions of librarians about how lawyers do research." Gilliland mentions findings regarding online usage, concerns about the quality of legal research, and how often lawyers sought out a librarian's assistance when facing unfamiliar legal issues.

Haruna, I.; Mabawonku, I. Information needs and seeking behavior of legal practitioners and the challenges to law libraries in Lagos, Nigeria. *Int. Inf. Libr. Rev.* **2001**, 33, 69.

Abstract: Several findings are included in this entry which examines the information needs and information-seeking behavior of lawyers in Lagos, Nigeria. The need to know the latest decisions of superior courts is the greatest professional information need for many lawyers. Other lawyers say they need to find recent legislation and to learn about local and international legal conferences. In this study, the library was identified as the most heavily consulted information resource, but most lawyers claimed the library does not fill its role in meeting the information needs of lawyers. The entry includes recommendations made on the basis of these findings.

Hazelton, P.A. Compilation, surveys on how attorneys do legal research. *Perspective*. January **1993**, 1 (2), 53.

Abstract: This compilation of citations to journal articles is at the end of an article by Hazelton on advanced legal research courses. The compilation includes cites to articles on legal training, lawyering skills, and two articles on the research habits of lawyers.

Innes, H.J. The evolution of the traditional: novice lawyer information seeking in a CALR world, <http://capping.slis.ualberta.ca/cap07/HeatherInnes/litreview.html> (last visited October 4, 2007).

Abstract: This website contains a review of studies on the information behavior of lawyers. Innes examines studies performed in England, Nigeria, and Canada, specifically, a survey by the Canadian Department of Justice (Operation Complex) and a follow-up survey by Mark Vale published by the Canadian Legal Information Centre. Additionally, Innes discusses studies by Kuhlthau and Tama on novice versus expert researchers and by Wilkinson on lawyers' preferred sources of information. Lastly, Innes reviews the history and the trends in the use of computer-assisted legal research.

Kuhlthau, C.C.; Tama, S.L. Information search process of lawyers: a call for "just for me" information services. *J. Doc.* January **2001**, 57, 25, 28–38.

Abstract: Prior studies by Kuhlthau based on the model of the Information Search Process (ISP) provide the basis

for her ongoing research. This study reviews the information-seeking tasks of lawyers in order to learn how they use information and to understand the role of mediators in the process of information seeking and use. The authors conclude that lawyers are often involved in complex tasks that require a constructive process of interpreting, learning, and creating. The study participants preferred printed texts over computer databases to accomplish these complex tasks primarily because computer databases required specific requests. "Just for me" services are explored as a way to help lawyers deal with complex information needs.

Leary, M.A.; Cooper, W.L. Research needs of outstate Michigan lawyers. *Mich. Bar J.* **1981**, 60, 641.

Abstract: This entry presents the results of a 1981 survey of 1592 Michigan lawyers whose offices were in counties without large public law libraries. The purpose of the survey was to find out the lawyers' requirements for 34 kinds of research material and to learn how they accessed the material. The goal of the survey was to discover the availability and the need for resources. The researchers found that Lexis and Westlaw were needed the least and that the Michigan Statutes Annotated was needed the most. Additionally, the respondents accessed their own libraries and other libraries (public, county, and university) for sources, like law reviews, court rules, and magazines. The authors make recommendations for improving access including improving funding for county libraries, increasing accessibility to resources in the State Law Library, and making use of technology for producing faster and cheaper documents.

Leckie G.J.; Pettigrew, K.E.; Sylvain, C. Modeling the information seeking of professionals: a general model derived from research on engineers, health care professionals, and lawyers. *Lib. Q.* **1996**, 66 (2), 161.

Abstract: This entry studies the information-seeking behavior of engineers, health care professionals, and lawyers. From their study, the authors create an original model of information seeking applicable to all professionals. The entry presents in detail the general model and its components. The entry concludes with suggestions as to the potential usefulness of the model.

Maine Bar Association. The survey: who we are, what we think. *Me. B. J.* **2007**, 22, 78–83.

Abstract: This entry presents the highlights of a survey on the services offered by the Maine Bar Association. The entry did not cite how the survey was presented, who was given the survey, or how many bar members responded. Most of the information in the entry focuses on who uses Casemaker and how they use it.

Marke, J.J. New study: how lawyers use the library, *N Y Law J.* November 21, **1995**, 214 (98), 5.

Abstract: This entry presents highlights from a 1995 survey conducted to determine how lawyers perform research. The questionnaire was sent to 1500 randomly

chosen alumni from five law schools. Responses were received from more than 440 people. The researchers wanted to find out what resources were used, how often they were used, where information was accessed, and the purposes for the research. Marke relates 20 highlights of the findings.

Palmer S. If you can't beat 'em, train 'em: how lawyers conduct legal research. *Leg. Inf. Alert.* January **2006**, 25, 1.

Abstract: This entry reviews the findings of the 2004–2005 American Bar Association Legal Technology Survey Report on lawyers in offices of 50 or more and suggests the uses of training to boost results. Palmer divides the entry into sections on survey results and training for legal sources and nonlegal sources. Palmer also suggests how to conduct effective training for lawyers in large firms.

Panel Discussion. Historical development of the American lawyer's library. *Law Libr. J.* **1968**, 61, 440, 458–460 [discussing three surveys conducted in Missouri (1966) and Pennsylvania (1965, 1968)].

This panel discussion briefly mentions these studies. More complete coverage of the surveys can be found in *The Research Habits of Lawyers* by Morris Cohen.

Sanders Reach, C.; Ikens, L.; Palmer, S.; Stine, S. *2007 ABA Legal Technology Resource Center Survey Report Online Research*; American Bar Association: Chicago, IL, 2007.

Abstract: In 1990, the ABA started to survey law firms on their technology usage. Since 2001, the survey changed to look at lawyers exclusively. The survey was sent to 28,018 ABA members in private practice: the researchers received 1876 responses. The findings were published in the Online Research section report (this volume), which represents one in a series of five volumes published annually. The Online Research volume includes a short trend report describing the general information gathered from the surveys. The rest of the volume contains graphic representations of the survey questions, covering everything from electronic budgets to the use of fee-based online legal research resources.

Reusch, R.T. *Patterns of legal research in North Dakota: a Survey.* *N. D. L. Rev.* **1985**, 61, 383.

Abstract: This entry explains the results of a 1984 survey conducted to determine how North Dakota attorneys use and acquire legal information and to figure out if North Dakota attorneys need a legal research assistance program. The survey was mailed to 1150 people, all members of the North Dakota State Bar Association who had addresses in North Dakota. A copy of the original questionnaire is included in the Appendix of the entry. The researchers received 505 responses. Reusch discusses the results of the survey, includes tables representing the results, and concludes that North Dakota needs an assistance program that provides services like affordable computer research services.

Speer, L. Private law libraries survey. *PLL Perspectives*. November–December 1989, 1 (2), 5.

Perspectives is a newsletter from the Private Law Library section of AALL. The table of contents for all the issues can be accessed through <http://www.aallnet.org/sis/pllis/newslett/newsletter.asp>. Visit your nearest law library for articles which are not yet available online.

Wilkinson, M.A. Information sources used by lawyers in problem-solving: an empirical exploration. *Libr. Inf. Sci. Res.* 2001, 23 (3), 257.

Abstract: More than 150 practicing lawyers were interviewed about their information-seeking behavior. The results demonstrated to the author that legal research should not be considered as the only information-seeking behavior of lawyers as has been assumed in past research. Administration of their law practices, for example, was identified as constituting a problem-solving, information-seeking activity. The study analyzes whether lawyers seek to solve problems through formal or informal means, whether they are likely to look to sources inside or outside their organization, and whether the lawyer's gender or size of practice influences the type of information resources sought. The model for information-seeking behavior of professionals as posited by others is analyzed and modifications are suggested that create a new model.

Learning and Information Seeking

Louise Limberg

Swedish School of Library and Information Science, University of Borås and University of Gothenburg, Borås, Sweden

Mikael Alexandersson

University of Gothenburg, Gothenburg, Sweden

Abstract

The purpose of this entry is to present and analyze the relationship between learning and information seeking. The analysis draws on research studies on information seeking set in educational contexts and is framed in theories of learning, mainly constructivism. Themes of the entry are based on five dimensions of the relationship between learning and information seeking: 1) seeking information for learning purposes; 2) learning information seeking; 3) teaching information seeking; 4) learning from information; and 5) reshaping conditions for information seeking and learning through information and communications technologies (ICTs). Conclusions are that the fields of learning and information seeking draw nearer to one another partly due to educational ideas based in constructivism and partly due to the development of digital tools that reshape conditions for learning in postmodern society. This development contributes to the transformation of the professional role of librarians, implying an emphasis on the pedagogical aspects of the profession. Future prospects for information seeking research and practice linked to learning may involve strengthened interests in the cognitive authority and expertise of information as well as information sharing through communicative interaction.

INTRODUCTION

The topic of this entry is the central relationship between learning and information seeking, where information seeking is seen as a condition for learning to take place. Our point of departure is that learning and information seeking are intimately intertwined in a constantly ongoing human activity. For purposes of research, education, and professional practice the fields of learning and information seeking have been divided into separate disciplines and occupational fields. As a human activity, learning and information seeking are inseparable and mutually shape each other.

A massive amount of empirical research on information seeking is set in learning contexts and is directed at students' information seeking for learning assignments. With few exceptions, the vast majority of such studies are restricted to an interest in information seeking and do not direct specific attention at the wider aspects of the learning processes or outcomes, which form the purpose as well as the result of the information seeking under study. During the last decades, societal developments in information and communication technologies as well as the globalization of economies have dramatically changed conditions for learning and information practices, with tools for online information seeking accessible worldwide. The Internet and other digital media have brought the world into classrooms and libraries implying immediate access to abundant amounts of information, and changing conditions for the ways and whats of teaching and learning. Traditional ways of teaching and

learning are substituted by inquiry-based methods, involving students in independent information seeking and use. One consequence is an increased emphasis within librarianship on teaching information skills to all kinds of users, especially students at all educational levels, from elementary school to undergraduate education. Librarians' expertise in information seeking together with the expansion of their professional domain into teaching contributes to reshaping the view of librarianship, where an emphasis on the pedagogical aspects of the profession is emerging. This in turn has contributed to an increased interest in the relationship between learning and information seeking. In this entry the topic of learning and information seeking is viewed as a range of interconnected dimensions pertaining to

1. Seeking information for learning purposes—associated with the common practice of information seeking related to carrying out learning tasks in formal educational contexts as well as in work-life or everyday life. In this respect, information seeking is strongly linked to the notion of lifelong learning.
2. Learning information seeking—a notion closely connected to the concept of information literacy, implying learning how to critically seek, evaluate, and use information in purposeful ways for various problems or situations.
3. Teaching information seeking—reflects the perspective of learning information seeking, and is a matter of interest in the field of information literacy education.

4. Learning from information—may be associated with information use rather than seeking, implying a range of various aspects such as understanding the contents of information sources, critically evaluating and relating sources to one another as well as to the topic of a task.
5. Development of information and communication technologies (ICTs)—changes in the conditions for information seeking and learning, reinforcing the connections, and interdependence between these two areas of human practice.

The aim of this entry is to present and analyze aspects of the relationship between learning and information seeking, taking into account the various dimensions listed above. The entry is based in theories of learning and in research on issues of learning and information seeking.

KEY CONCEPTS

Learning is nowadays one of the most frequent concepts used in more or less all social practices—both formal and informal. It is closely related to notions of communication and knowledge but also to meaning-making. Learning is generally seen as contextual and as an integration into a community of practice in which social actions are identified. It is a social activity in which the learner uses sensory input and constructs meaning out of it. Learning involves language, and language and learning are inextricably intertwined.

Information seeking—the concept of information seeking is well established in Library and Information Science (LIS). However, the term “information practices” is currently being used for including new perspectives on the concept, implying that information seeking can only be understood as embedded in the practices in which it takes place. In this entry, the terms “information seeking” and “information practice” will be used interchangeably to denote information seeking practices related to learning. It is worth underlining that related to learning information use is of particular interest, as an extension of information seeking.^[1] Research of concepts, contexts, and practices of information seeking is the object of interest of ISIC: the Information Behaviour Conference where information seeking related to learning has lately gained ground.

STAKEHOLDERS, ASSOCIATIONS, AND INSTITUTIONS

It appears that until the early 2000s the interest in pedagogical issues was greater within the professional practice of librarianship than within the research communities of information seeking. One example of this is Donald Case's survey of information seeking research,^[2] devoting

very scarce space for studies of information seeking set in learning contexts. This may be contrasted to the abundant literature in professional journals, especially those targeted at academic and school librarianship, on the topic of students' information seeking, and often linked to interests in information seeking and learning.

School and academic librarians are central agents in the field of learning and information seeking. A range of professional organizations devote considerable interest to issues of teaching and learning information seeking and use. Two such organizations in the United States are the Association of College and Research Libraries (ACRL), the largest section of the American Library Association (ALA), which publishes the journal *College and Research Libraries*, and the American Association of School Librarians (AASL), also a section of the ALA. AASL, the most important professional association for school librarianship, publishes one print journal, *Knowledge Quest*, and an online research journal, *School Library Media Research*. In these publications, topics of learning and information seeking appear frequently. There are similar professional associations in other parts of the world, for instance, the Australian and New Zealand Institute for Information Literacy (ANZIIL), and, in the Nordic countries, the Nordic Forum for Information Literacy (NordINFOLIT), all with a common interest in advocating information literacy education. An informative Web log on information literacy is located at <http://information-literacy.blogspot.com/>. The International Association of School Librarianship with the research journal *School Libraries Worldwide* is yet another example. The mentioned associations and networks combine a strong interest in the relationship between learning and information seeking, and strive to link professional interests with research communities through conferences, seminars, and publications.

The Center for International Scholarship in School Librarianship (CISSL) at Rutgers University (<http://cissl.scils.rutgers.edu/>) is an international research and scholarly centre that examines the dynamics and impacts of school libraries on student learning, and has a strong interest in learning and information seeking.

FOCUSING LEARNING THEORIES FOR UNDERSTANDING “LEARNING AND INFORMATION SEEKING”

Studies of how and what individuals learn while seeking information either in an educational setting such as a classroom or a library, through books or through the Web, depend on theoretical assumptions about teaching and learning. These assumptions are based in epistemology and raise issues such as What is knowledge? Where is knowledge? How is knowledge created? What is knowledge about?

Theories of Learning

Basically, three main theoretical assumptions—or waves—underpin the late history of learning. Before we outline constructivism which, in its different forms, is the most current in research today, we shall comment briefly on the other two waves. The first wave—*behaviorist theory*—corresponds to an empirical tradition founded in the assumption that learning is based on physical experience and that individuals tend to repeat behavior linked to positive experiences of satisfaction or reinforcement. B.F. Skinner^[3] was a particularly influential scholar in this tradition, claiming that only behavior itself—not inner processes such as thinking or reflection is considered as available for study. Human learning is seen as a change in external, observable behavior, while cognitive activities are considered unavailable to scientific observation. Research based on behaviorist theory claims that reality is observable and that there is objectivity in all empirical data. The golden age of behaviorist theories of learning lasted until the end of the 1950s.

Cognitive theory—the second wave—challenged behaviorist theory as the dominant paradigm with its restricted application of scientific methods. The main argument was that people are not “programmed animals” that merely respond to environmental stimuli; people are rational beings who actively participate in learning, and whose actions are a consequence of thinking. During the 1960s cognitive-oriented researchers became interested in what takes place in the mind of the learner. Changes in behavior were still observed but only as indications of what occurs in the learner’s mind. Cognitive theory focuses on inner mental activities—opening the “black box” of the human mind is therefore a valuable and necessary contribution to understanding how people learn. Research interests are directed at the exploration of mental processes such as thinking, memory, knowing, problem solving, and information processing. Knowledge is seen as schema or symbolic mental constructions and learning is defined as changes in a learner’s schemata. Cognitivism was strongly inspired by the emerging computer technology, viewing humans as processors of information.^[4]

Constructivism—The Third Wave to Understand Learning

Towards the end of the 1980s a third wave—Constructivism—partly replaced cognitive theory. Today constructivism represents one of the major ideas in education and has been characterized as the dominant philosophy of learning. It proposes that learners need to build their own understanding of new ideas, and that information emerges within these built constructs rather than exists in the external environment. John Dewey^[5] is often cited as the philosophical founder of this approach. Its implications for how teachers teach and learn to teach are enormous. The constructivist approach to teaching and

learning—and also to information seeking—is based on a combination of a subset of research within cognitive psychology and a subset of research within social psychology.

Constructivism embodies two major perspectives, cognitive constructivism, and social constructivism. These perspectives are different in emphasis, but they also share many common views about teaching and learning. Widespread interests in the theory of constructivism have led to a debate between those who emphasize the individual cognitive structuring process and those who emphasize the social context of learning. While Jean Piaget^[6] is considered the major theorist among the cognitive constructivists, Lev Vygotsky^[7,8] is the major theorist among the social constructivists. The core of different theories related to social constructivism goes back to Vygotsky’s cultural historical theory of human development propounded in the 1920s and early 1930s. Standard discussions of the difference between Vygotsky and Piaget place a crucial distinction in the proximal locus of cognitive development. For Piaget, individual children construct knowledge through their actions in the world: to understand is to invent. In contrast, the Vygotskian claim is that understanding is social in origin (see further discussion in Wertsch^[9]). According to Vygotsky,^[8] “Every function in the child’s cultural development appears twice: first, on the social level, and later, on the individual level; the first, between people (interpsychological), and then within the child (intrapsychological).” He claims that this development principally takes place through a form of apprenticeship learning.

Cognitive constructivism

Jean Piaget’s theory of cognitive development suggests that humans cannot be “given” information which they automatically understand and use, they must “construct” their own knowledge. They have to build their knowledge through experience. The role of the teacher is to provide a classroom full of interesting things to encourage students to construct their own knowledge and to develop their ability to explore phenomena in the world. The classroom should offer students the opportunity to construct knowledge through their own experiences. There is less emphasis on directly teaching specific skills and more emphasis on learning in meaningful contexts. Piaget’s ideas concerning active construction, structuring knowledge, and stages of development, have been drawn on for some time in education and especially, during the last decades in the ongoing integration of ICT in education.

Constructivist approach to information seeking research

Some major work has been done on information seeking and learning using constructivist approaches. Carol Kuhlthau’s studies and her ISP model is a prominent example of

information seeking research framed in a constructivist view of learning with an emphasis on individual learners. Kuhlthau articulates information seeking as a process of construction and she emphasizes that her research is directed at intellectual access to information and ideas, implying a close relationship to learning. The model adopts the user's perspective of the information seeking process, and thus places the user as the central actor, constructing meaning through the process.^[10] Kuhlthau's model has been highly influential in LIS research as well as in professional practice.

Limberg studied the interaction between information seeking and learning in the context of upper secondary school using a phenomenographic approach.^[11–13] Phenomenography has a linkage to cognitive constructivism and constitutes a theoretical strand for framing research on information seeking and learning. Similar to cognitive constructivism phenomenography has human experience as its object and investigates people's experiences of phenomena in the world.^[14] From a phenomenographical standpoint the world exists and different people construe it in different ways. The main focus is on the qualitatively different ways in which people experience something or think about something, e.g., photosynthesis or information seeking. Besides Sweden, where a phenomenographic approach has been adopted for studying the interaction between information seeking and learning,^[11–13] phenomenography is also being frequently used among information literacy researchers in Australia and the United Kingdom.^[15–19]

Social constructivism

Lev Vygotsky's claim that social learning precedes development is linked to his focus on the connections between people and the context in which they act and interact through shared experiences. According to Vygotsky, humans use cultural tools, such as speech and writing, to mediate their social environments. Initially children develop such tools in order to function socially as ways of communicating needs. Vygotsky claims that the internalization of these tools leads to higher order thinking skills. For Vygotsky culture provides the child with the cognitive tools needed for development.^[7] Today such tools also include electronic means of information access.

There are some general principles of learning that are derived from social constructivism. These principles are

- Learning is an active process in which the learner uses sensory input and constructs meaning out of it. In the learning process the learner compares new experience with knowledge constructed from previous experience, resulting in the reinforcement or adaptation of knowledge. Knowledge is not a fixed object; the individual constructs it through experience with the object of study.

- Learning is constructing meaning and systems of meaning. Shared meanings develop through negotiation in the learning environment, leading to the development of common or "taken-as-shared" knowledge. According to a constructivist view, knowledge is not "about" the world, but rather "constitutive" of the world.
- Learning involves language, and language and learning are inextricably intertwined.
- Learning is a social activity. It is intimately associated with our connection with other human beings. It takes place within some sociocultural setting. Social interactions within the learning environment are an essential part of this experience and contribute fundamentally to individual knowledge construction.
- Learning is contextual. We learn in relationship to what else we know, to our beliefs, our prejudices, and our fears.

Situated cognition and situated learning

Vygotsky's theories, and those of other developmental psychologists, form the foundation for the concepts of situated cognition and situated learning. Constructivists view cognition as situation-bound and socially distributed rather than as decontextualized tools and products of the mind. It is not possible to separate cognitive tasks from social tasks, because all cognitive tasks have a social component. Thinking is both physically and socially situated and problem tasks can be significantly shaped and changed by the available tools and the social interactions that take place during problem solving. Situated cognition emphasizes apprenticeship, coaching, collaboration, multiple practices, and articulation of learning skills, stories, and technology. Applied to information seeking, this means a variety of ways of seeking and using information linked to various practices. It further implies a wide variety of ways of learning how to seek and use information related to various tasks, tools, and situations.

The concept of situated learning means that knowledge is situated and is partly a product of the activity, context, and culture in which it is used. Situated learning occurs when students work on authentic tasks in real-world settings. Knowledge cannot be taught in the abstract; it can only be constructed in context. Jean Lave^[20] states that learning is a function of the activity, context, and culture in which it occurs, in contrast with most classroom learning which tends to be abstracted from context. Toward the beginning of the 1990s Jean Lave^[21] and Etienne Wenger^[22] developed a model of situated learning proposing that learning involves a process of engagement in a "community of practice." Their basic argument is that communities of practice are everywhere; at work, at school, in the home, or

associated with our civic and leisure interests. The sustained pursuit of a shared enterprise gives rise, over time, to these communities. The concept of “community of practice” has had a huge impact on both research and practices of learning—both formal and informal.

A sociocultural view of learning and information seeking

Parallel to the development of the concepts of situated cognition, situated learning, and community of practice, sociocultural theory has developed and has become a powerful and competitive paradigm in today’s landscape of social and cultural sciences. The core of the sociocultural theory is rooted in Lev Vygotsky’s view of learning as communicative interaction, and it has gained in significance in learning and information seeking research during the last decade. James Wertsch,^[9] one of the main scholars in this research field developed Vygotsky’s theory in relation to contemporary issues and argues, as Vygotsky did, that human mental functions are inextricably situated in social, cultural, institutional, and historical contexts. From a sociocultural standpoint language is seen as the most important cultural tool available to man. It is through communication that sociocultural resources are created, but it is also through communication that they are carried forth.

Sociocultural theorists view learning as integration into a community of practice in which social actions are identified. Learning is seen as the process by which individuals are introduced to a culture by more skilled members. As this happens they “appropriate” cultural tools through their involvement in the activities of this culture.^[23] This implies that the contents of learning (e.g., subject matter of learning assignments), the contexts in which people act (e.g., school, undergraduate education, specific course or discipline, work-life), and the cultural tools (e.g., the Web, Google, databases, journals, textbooks) people have available, must be taken into account in the understanding of what characterizes productive learning. A sociocultural perspective has been increasingly applied in recent studies of information seeking and learning^[24–26] as well as in information literacy research.^[27–30]

Summary

The constructivist paradigm has led us to understand how learning and information seeking may be facilitated through certain types of engaging, constructive activities. This view of learning and information seeking emphasizes meaning-making through active participation in socially, culturally, historically, and politically situated contexts. A crucial element of active participation is dialogue in shared experiences. Situated collaborative activities, such as modeling, discourse, and decision-making,

are necessary to support the negotiation and creation of meaning and understanding.

Theories of Learning in Information Seeking Research and Practice

It is worth pointing out that very few studies on information seeking in learning, or in other contexts, have framed their research within a theoretical perspective of learning. Case’s survey of research on information seeking^[31] lists a number of theories applied in information seeking studies; among the disciplines most frequently used during the last 30 years are sociology, communication, and psychology. Exceptions to this statement have been mentioned above as examples of information seeking research framed in theories of learning.^[10–13,24–26] In a wider perspective we see that constructivism has influenced information science, for instance in the theory of sense-making. However, sense-making has not been specifically linked to learning. Such wider theoretical applications of constructivism go beyond the scope of this entry. A qualified prediction is that constructivist theories of learning will be increasingly applied in future research on information practices, given the growing interplay between information seeking and learning in ICT environments.

While constructivist theory is only beginning to be utilized to frame research in information seeking, the experiences and observations of school and undergraduate education during the last decades, suggest that constructivist ideas have strongly influenced practices in education and librarianship during this period, shaping teaching and learning in ways that engage students in active information seeking for independent, inquiry-based learning. Constructivist views of learning have, thus, contributed to the increased interest in the relationship between learning and information seeking.

INFORMATION SEEKING FOR LEARNING PURPOSES

The issue of information seeking for learning purposes is tied to the context of students’ carrying out learning assignments implying independent information seeking for finding, selecting, evaluating, and using a variety of information sources to construct meaning about some particular knowledge content. Research questions related to such practices concern how students seek, select, and use information for their tasks. How do task requirements interact with students’ information seeking? How do students experience information seeking for learning assignments? Research studies have focused on students’ *searching* behavior that is on their interaction with online information systems and digital tools, as well as on their information *seeking* behavior, that is the series of searches related to the same learning assignment.^[32]

Over the years, thousands of empirical studies have been carried out on students' information seeking in contexts of formal learning at all levels of education, from elementary school to undergraduate levels. Only a few of these take the learning context into close account. Vakkari^[33] criticizes typical studies of university students searching for information without framing these activities within their contexts of learning assignments.

As pointed out above, information seeking for learning purposes characterizes ways and means of learning in classrooms throughout the world in contemporary society. Textbooks and library collections have been replaced by information accessible online, where the World Wide Web is the main resource for access to information, and is widely used in schools and universities all over the globe. Independent learning through active information seeking, however, has a longer history than the World Wide Web. Student-centered learning linked to information seeking is clearly influenced by the constructivist view of learning, which allocates great responsibility for knowledge construction to learners and their exploration of the world through various information resources. Before the breakthrough of the Internet when students were required to seek information independently for their school tasks, information resources were restricted to local collections, where teachers and librarians exerted control over what was available for students. In those days the crucial problem tended to be to find and retrieve any sources relevant for students' various tasks. Librarians and teachers would spend a lot of time building up collections suitable for school curricula and instructional units. In the Internet era corresponding activities of collection building take the form of collections of links to approved information resources or recommended Web sites, hosted by libraries or other knowledge institutions. It is hard to deny that the breakthrough of the Internet has brought dramatic qualitative changes to education and conditions for learning. It is not just a matter of quantities of information but of new ways of interacting with and communicating via digital tools, opening up the walls of classrooms, libraries, and school buildings.

Learning Tasks

A critical issue of information seeking related to learning is the character of the learning tasks that students work with. The concept of task is germane to information seeking in educational and learning contexts. Nevertheless, this area of research does not often present itself as task-based. It seems that the task is more or less implicit in information seeking studies set in learning contexts.

Particular conditions shape the practice of information seeking related to learning tasks in formal education. Two such conditions are that they are always imposed,^[34] and that they are related to the intended learning outcomes of various contents as well as to abilities. The intended learning outcomes are formulated by teachers and ideally

expressed in the goals of an assignment. A typical attribute of learning assignments is that students' work and their mastery of subject matter and various competences, such as information seeking, are subject to assessment by teachers. This indicates the importance of an ever-present norm in education, expressed in assessment and evaluation. This norm implies that there are poorer or better ways of understanding and managing a particular phenomenon, with reference to the cognitive authority^[35] of teachers, curriculum, science, and academia. This necessarily is a critical feature of information seeking related to learning tasks.

Students' Information Seeking

One issue, discussed both in research and in teachers' and librarians' professional practices is that students tend to adopt a restricted fact-finding approach to information seeking for learning tasks. Students' intentions and ensuing approaches tend to be focused on finding enough information and then writing up a report for submission in due course. This is found to be typically linked to learning assignments and shaped within the discursive practice of school.

Since the mid-1990s intensive interest has been devoted to studies on students' information seeking in digital environments, especially the Web. Findings from such studies indicate that students exhibit great self confidence in their own ability to search the Web and find what they are looking for. In spite of this, according to the teachers and librarians as well as to the researchers involved, students' information seeking seems neither adequate nor effective for the purposes of their school-related assignment. Young people seem to be more successful in information seeking for their personal interests and for everyday life. This indicates differences between the cultural practices of school and of students' leisure time and may imply a gap between information practices developed inside and outside school, which in turn might complicate efforts of learning and teaching the critical abilities required for information seeking and use.

A British research group^[36] recently studied the information expertise of the "Google generation," that is those born after 1993. Main questions were whether or not young people are searching for and researching content in new ways, different from the ways that existing scholars carry out their work, and whether this is likely to shape their future behavior as mature researchers. The study was commissioned by the British Library and Information Systems Committee (JISC, U.K.) with the aim to inform and stimulate discussion about the future of libraries in the Internet era. JISC's activities support education and research by promoting innovation in new technologies and by the central support of ICT services. Findings partly confirm previous studies of students' information seeking practices, indicating shortcomings among students both as regards their use of digital tools and search operators and

particularly as regards students' ways of assessing and evaluating information—or rather their lack of conscious and systematic evaluation of information. Students' primary evaluation criterion is the topicality of content. Conclusions drawn from this study, as well as from similar studies, are that they highlight the importance of teaching and learning how to critically evaluate and assess information, related to various contexts and situations.

University students' information seeking has been investigated within a framework of learning theories about differences in learning styles^[37,38] as well as differences between undergraduates' epistemological beliefs.^[39] Findings indicate that different study approaches influence both search strategies and reflective judgment on information sources.

LEARNING AND TEACHING INFORMATION SEEKING

"All information-seeking behaviour is learnt, nothing is innate," according to Wilson.^[40] Linked to constructivist theory of learning information seeking can be viewed as an object of learning, which may be constructed and reconstructed into various shapes or ways of understanding related to the different contexts and situations in which it is carried out.

A constructivist approach to learning emphasizes, as described above, authentic, challenging projects in professional practices that include students, teachers, librarians, and experts in the learning community. Its goal is to create learning communities that are more closely related to the collaborative practice of the real world. In an authentic environment, learners assume responsibility for their own learning, they have to develop metacognitive abilities to monitor and direct learning and performance. When people work collaboratively in an authentic activity, they bring their own framework and perspectives to the activity. They can see a problem from different perspectives, and are able to negotiate and generate meanings and solutions through the activity itself. From this viewpoint it is counterproductive for teachers to make all the vital decisions about what is to be learned and how it should be learned and to be the sole dispenser of information without involving students in the decision process. To then assess students' abilities in constructing knowledge seems to miss the point. In other words, guided instruction is suggested, placing students at the centre of the learning process, and providing guidance and concrete teaching whenever necessary.

Learning Information Seeking

The notion of fact-finding is a widespread way of understanding information seeking, implying searching for facts with the aim of finding correct answers to specific questions, such as: "How many casualties were caused by car

traffic in Sweden in 2006?" or "What are the colors of the South African flag?" However, learning assignments in education as well as in work-life often concern highly complex issues, such as "How can we reduce global warming?" or "How does gender affect work-life in Germany?" Research as well as professional experience show that the notion of information seeking as fact-finding is too restricted in relation to complex questions.^[12,24,41]

Information seeking linked to inquiry-based assignments insists on information *use* rather than seeking and finding, and requires critical and conscious evaluation and analysis of sources for the purpose of constructing meaning through information. Forming an understanding of information seeking and use appropriate for complex learning assignments thus involves examining the way users interpret information for meaningful learning. Christine Bruce emphasizes the interdependence of information use and learning and proposes the term *informed learning* for "engaging in information practices in order to learn" or "engaging with the different ways of using information to learn."^[16] Constructivist ideas about guided instruction in collaborative work on authentic learning tasks form an appropriate theoretical foundation for understanding this type of learning, and has implications for teaching.

Teaching Information Seeking

The idea of information seeking behavior as learned further suggests that education can support people in developing suitable ways and means of seeking and using information. This concerns teaching information seeking practices for learning purposes. Teaching information seeking has a long history with a background in library skills instruction (bibliographic instruction) from the first half of the 1900s, later to be succeeded by information skills instruction from the 1970s. Library skills (bibliographic instruction) tended to encompass knowledge about the use of libraries and its various tools such as catalogs, indexes, and various reference tools (bibliographies, abstracts). Library skills instruction corresponds to what is sometimes called the bibliographic paradigm in LIS, based on the structure and order of collections of documents. The concept of information skills implies less focus on documents, and encompasses instead a wide range of information resources, such as lectures, texts, pictures, field studies, interviews, etc. going beyond the walls of libraries or information centers. An influential model in this tradition is the Big6 Skills (<http://www.big6.com/>) model first presented in the 1980s and since then widely developed and marketed.^[42] Models of information skills instruction tend to be framed in a cognitive view of learning, emphasizing ways of thinking, and mental models.

Since the early 1990s the concept of information literacy has replaced earlier concepts such as information skills or library skills for labeling the art of purposeful and adequate information seeking related to a task or a problem. There

are large numbers of definitions of what constitutes information literacy, which will not be dwelt upon in this entry. Nevertheless, in the context of this entry we wish to draw attention to the links between, on the one hand, learning information seeking, and on the other, the concept of information literacy. The relationship between information seeking and information literacy is inherent in the notion of learning and teaching information seeking. Information literacy implies mastering appropriate ways of seeking and using information for various purposes, and as emphasized above, this ability is an object of learning. In this respect, the interest in the practice of teaching information seeking for information literacy is simultaneously related to a long-term interest in pedagogical issues within librarianship and to the specific condition that contemporary information and communication technologies provide (See the entry, "Information Literacy," p. 2421).

Constructivism has important implications for teaching and of course for scaffolding information seeking. Teaching is not viewed as the transmission of knowledge from the enlightened to the unenlightened; constructivist teachers do not take the role of the "sage on the stage." Instead, constructivist teachers create a context for learning in which students may become engaged in interesting activities that encourage and facilitate learning. The teacher may often guide students as they approach problems, may persuade them to work in groups to think about issues and questions, and support them with encouragement and advice as they tackle problems, adventures, and challenges rooted in real-life situations that are both interesting to the students and satisfying in terms of the result of their work. If learning is based on prior knowledge, then teachers must take that knowledge into account and provide learning environments that exploit inconsistencies between learners' current understandings and the new experiences before them. This challenges teachers, since they cannot assume that all students understand something in the same way. Further, students may need different experiences to advance to different levels of understanding. These constructivist ideas apply equally to different teaching areas, including information seeking.

LEARNING FROM INFORMATION

As mentioned above, the majority of research studies in the area of information seeking and learning restrict their interest to information seeking, not taking learning outcomes into account. However, since the mid-1990s there are examples of studies where the object of research is to explore the interaction between information seeking and learning, including an interest in studying students' learning outcomes related to their information seeking and use.^[12,24,25,41,43] These studies have adopted either a cognitive constructivist or a social constructivist view of learning as a theoretical framework. The research object

of such studies concerns the major question about what characterizes the complex links between information seeking, information use, and knowledge formation, that is the transformation of information into knowledge.

Information Seeking and Learning Outcomes

Findings from such studies identify various approaches that students adopt in information practices for learning purposes. Related to complex learning tasks, a fact-finding approach is found to coincide with a poor learning outcome, characterized by fragmentary pieces of knowledge. Approaching information seeking as analyzing and scrutinizing information for understanding a complex issue, for finding different perspectives, and for identifying values and hidden motives in information sources corresponds with sophisticated learning outcomes. High-quality learning outcomes are characterized by students' abilities to argue coherently about an issue, to discuss matters from different perspectives, and to make consistent inferences based on substantial factual knowledge. Conclusions drawn from these studies are that there is a close relationship between the quality of information seeking and use and the quality of learning outcomes.

Information Use as Text Transport

Observations in practice as well as in various studies of students' information use related to ICT for learning assignments concern the issue of "copy and paste." Learning outcomes as represented in students' papers indicate the common practice of moving text from information sources to students' own texts, sometimes also slightly transforming the original texts through deleting or adding a few word, making the text "their own." Occasionally this text transport is seen as plagiarism by educators. However, studies on students' ways of using information sources to produce their own texts show that the transport and transformation of text may constitute practices developed among students in order to deal with their writing tasks as best they can. The studies also indicate that this practice is part of the discursive practice of school, where copying and memorizing text is a long-standing tradition. The findings indicate that the art of using other people's texts for producing one's own text is an ability that requires purposeful learning, and that teaching this ability needs to be better developed.^[24,25,44]

We conclude that this aspect of information use for producing new text is worthy of further research as well as considerations for ways of changing practice.

Critical Features for Meaningful Learning Outcomes

Studies of the relationship between the quality of information seeking and use and the quality of learning outcomes identify a range of critical features, that is qualities that

make a difference, for meaningful learning. These features relate to various dimensions of learning tasks. It seems essential that learning assignments are based in researchable questions, meaning inquiry-based assignments built on questions that are appropriate for examining complex issues, neither simple fact-finding questions, nor very broad and unspecified topical questions. For meaningful learning it is further underlined that various aspects of information practices should be observed throughout the learning process, implying a shift from an emphasis on information skills instruction toward a stronger accent on the critical use of information. It is considered as vital that the interactions between teachers and librarians on the one hand and students on the other focus strongly on the knowledge contents of an assignment; researchers found that the interaction in information use for learning is often directed at order and procedure rather than at the process of understanding and constructing meaning through information use. Meaningful feedback through assessment on various dimensions of tasks, including aspects of information practices, is further underlined as necessary for supporting meaningful learning.

Learning and Information Seeking Shaped by School Practice

A sociocultural view of information seeking and learning sheds light on the interplay between the described practices of information seeking and learning. We may assume that authentic exploration of complex tasks in school settings is contrary to the tradition of schooling. The limitations and shortcomings of information practices and learning outcomes observed in a number of studies set in school contexts may be explained by the idea that information seeking and learning are shaped by the discursive practice of school, where the traditional mission has been to deliver “the right knowledge” and for students to learn “the right answers.” Studies that take the entire process from task initiation to learning outcomes as their research object, observing information practices embedded in the learning task, contribute to multifaceted understandings of the intricately interwoven process of learning and information seeking. The different strands of information seeking and learning shed light on each other. Through the identification of important critical features required for meaningful learning to occur, these studies imply that the discursive practice of school may be reshaped through reflective and conscious ways of designing, shaping, and managing situations for authentic learning.

CONCLUSIONS

Our presentation of learning and information seeking is founded on the view that these strands of human activity are inextricably intertwined, mutually shaping each other.

The analysis has shown that current constructivist theories strongly influence learning and information practices, emphasizing the perspective of students or users. These changes of practice currently contribute to a gradual change within librarianship underscoring the pedagogical aspects of the profession. The analysis also suggests that there is a powerful potential in the use of learning theories for framing studies of information practices. This development strongly interacts with ICT technologies and practices.

Based on these conclusions we propose that ideas for future research will need to explore concepts such as the reshaping of the authority and expertise of information, information sharing, and the professional role of librarians. All three topics are related to further innovation in ICT, and the development of new digital tools for information use and learning.

In postmodern society individuals are allocated great responsibility for their own active choices. This means that public institutions, such as libraries and schools, are in a process of transformation from controlling knowledge processes to supporting people’s own decision-making about where to find information and how and what to learn. One implication of this change concerns the view of expertise, the authority of knowledge, and the control of information constituted by the new digital tools and media, especially the Internet. Authority issues currently receive much attention not only in information science but also in other fields, including education, human–computer interaction, and computer science. The essence of cognitive authority^[35] is that people primarily depend on others for ideas as well as for information outside the range of direct experience. The concept of cognitive authority provides an important framework for understanding the basis on which information users decide whether a particular information source is credible or not, and we anticipate further exploration in matters of the authority of information as essential for issues of knowledge, learning, and information at all levels of society.

It is obvious that new digital tools for information seeking and learning change the form, the content, and the infrastructure for learning in our society. New tools, such as those associated with the concept Web 2.0, which allow the production, interaction, and sharing of information, blur the boundaries between producers, mediators, and consumers of information and knowledge. Relevant research questions to investigate may concern how students handle the issue of formal expertise and control of information in Web 2.0 tools, and how people in current and future online environments—such as Web 3.0—create trust and reflect upon authority.

Another anticipated research area concerns *information sharing*. Our view is that research on collaborative information seeking and learning is of vital importance for further understanding of the essence of learning and information seeking in postmodern society. We see

information seeking and learning as firmly embedded in work and other social practices. This view intertwines work practice with information practice and information technologies. The social and collective aspects of human knowledge and experiences involve both information seeking on a collective level, and the relationship between people and the sharing of other people's knowledge and experiences. From this perspective we see a mutually shaping relationship between information and collaboration practices and the tools developed for the purposes of communication and knowledge sharing. A central issue is how can learning by sharing information be developed and supported in the future?

It has been repeatedly pointed out in this entry that the intensified interest in the relationship between learning and information seeking, caused by constructivist theories as well as the development of ICT, has contributed to reshaping the occupational practice of librarianship, emphasizing the pedagogical aspects of the profession. The research topics suggested above about the shift from authority and control of information to sharing responsibilities of authority and expertise with users reinforce the changing professional role of librarians, and need further exploration through research. Web 2.0 tools constitute a heated issue in current librarianship. Research questions that need further exploration in relation to this topic concern the characteristics of librarians' expertise in relation to users' information seeking and learning in Web 2.0 environments, as well as the characteristics of the negotiation of the professional expertise of librarianship in relation to other knowledge professions such as teachers and journalists.

These are but a few ideas for future research in the dynamic field of learning and information seeking. We want to conclude by insisting on the potential for understanding information practices through further examination of the multifaceted and intricate relationship between learning and information seeking.

Libraries

Jennifer Weil Arns

School of Library and Information Science, University of South Carolina, Columbia, South Carolina, U.S.A.

Abstract

People have recorded information in many ways for many centuries. The media used for these activities have changed with social circumstances and technological developments, as have the opportunities and means to collect and organize recorded knowledge. As a result, libraries have taken many forms over time, moving most recently from primarily paper-based collections to collections that house a wide range of media and experiment with new technologies. Library services have evolved also, and they now engage multiple communities, including children, young adults, and a wide range of educational, governmental, and corporate organizations. Library missions, however, have remained relatively constant: identifying, collecting, organizing, and providing access to materials with personal or social value.

While generally defined as a collection of materials organized so that they may be easily identified and used by an individual or group, libraries have actually taken many forms over time, reflecting the cultures in which they are embedded and propelled by technological innovations and social currents. The commonalities that have survived these changes pertain to collection, organization, and mission, however, even these continue to produce lively discussion.

LIBRARIES OF THE ANCIENT WORLD

In ancient times, merchants and farmers recorded their activities, accounts, possessions, and experiences using materials that needed to be preserved and organized in order to record events and construct meaning. Examples of these include early Sumerian clay tablets dating from 3000 B.C. that contain pictorial representations and, eventually, more standardized symbols; <http://www.upenn.edu/museum/Games/cuneiform.html>).^[1] Excavations conducted at Ugarit, Syria have unearthed deposits of tablets, thought to date close to 1200 B.C., that appear to have served palace and temple as well as personal record keeping purposes.^[2] Another palace collection, the Royal Library of Ashurbanipal, included thousands of tablets dating from the seventh century B.C. The subjects presented in these, found in northern Mesopotamia, ranged widely, including religious texts, poetry, royal decrees, and incantations.^[3] There is some evidence of purposeful collection and subject organization, and the collection is now housed at the British Museum (http://www.britishmuseum.org/research/research_projects/ashurbanipal_library_phase_1.aspx).

Historical records provide more information concerning the famous Royal Library of Alexandria. Assembled both

thoughtfully and aggressively, the collection is believed to have been the largest of its time. The library's contents mirrored the subjects that characterized Greek literature during this period, and works in other languages were frequently copied and translated in order to broaden the scope of the collection. In addition to its unmatched size and scope, this library is notable for the presence of both a cataloging system that provided some degree of subject access and the presence of designated librarians.^[3–5]

As the Roman Empire expanded, few libraries flourished. Those that did so relied on the interests of a small group of powerful leaders and wealthy individuals who moved parts of the plundered Greek collections that interested them to locations of their choosing. In some cases, these libraries appear to have been open to scholars and members of the literate public; however, with the sacking of Rome and decline of the empire most were destroyed or abandoned. The literature they contained, including materials once housed in the Greek libraries, was lost to those who did not live in the Byzantine and Moslem empires.^[6]

MEDIEVAL LIBRARIES

Within the disordered society that followed, the preservation of information was often more explicitly linked to the power of memory than to the security of shelves and buildings. Common cognitive frameworks likened experiences and facts to objects that could be stored in imagined rooms containing categorical or symbolic pointers that facilitated recollection through visualization. Memory-making was a recognized craft, with tools and techniques that were specifically taught and particularly valued within the monastic culture for public use in sermons and personal meditations. Imaginative literature,

including stories, poems, and popular histories, were similarly stored and restored in memory as they evolved through retelling.^[7]

The traditional libraries of this period were typically created and maintained by religious orders. Their collections, often mixtures of scrolls (rolled pieces of paper or papyrus) and codices (an early form of the book, with pages cut and bound together), were usually modest and stored in chests or cupboards with little need for special attention or finding aids. Larger collections accumulated in religious and commercial settings, and in these situations, physical subdivision was typically used to indicate variations in use or topic. Physical descriptions were also sometimes recorded, and a degree of subject classification occurred in some of the larger libraries, including the collections housed at Christchurch, Canterbury, and Durham Cathedral in England.^[8] The value of the collections varied. Reading, and consequently, transcription, was emphasized within the Benedictine order. In some instances, the act of transcription was connected to religious experience.

RENAISSANCE AND EARLY MODERN LIBRARIES

The expansion of trade, the rediscovery of classical literature, and the formation of secular political states combined to contribute to a decline in the relevance of small monastic libraries and the emergence of more familiar modern models. The first, the extensive private library, was directly associated with the concentration of wealth that characterized the Renaissance period. These libraries housed collections created by the Renaissance rulers and commercial princes, including the Laurentian Library commissioned by the Medici pope Clement VII and the personal library of the Duke of Urbino. A royal library may be found today at Windsor Castle (<http://www.royalcollection.org.uk/default.asp?action=article&ID=21>).

The intellectual and artistic awakening that characterized the Renaissance also propelled and transformed university education, almost doubling the number of universities functioning in Europe.^[9] The curricula at the famous universities that were already in place, including the University of Bologna, the University of Paris, and Oxford and Cambridge Universities, were also developing rapidly; and these changes, as well as new pedagogical methods, increased the influence and size of university libraries. The growing availability of printed books also favored larger collections, the appointment of librarians, and the development of printed catalogs.

The national libraries that emerged toward the end of this period were typically created for custodial as well as educational purposes. In many cases, their contents were drawn from the private collections of monarchs, scholars, and statesmen, including Charles the V of France, whose

personal library is linked to the founding of the Bibliothèque Nationale, located in Paris. The Royal Danish Library was built similarly upon gifts from Frederick III of Denmark, and the Vatican Library benefited from the attention of popes Nicholas V and Sixtus IV in the fifteenth century. The British Museum Library was likewise partially assembled from collections owned by the family of Sir Robert Cotton and the Old Royal Library of the English sovereigns. The United States Library of Congress benefited similarly from the collections of President Thomas Jefferson and the scholar Peter Force. Many smaller libraries today benefit from contributions of time and funds from library benefactors. The Placitas Community Library in the U.S. state of New Mexico provides an example of a library that has been created by community members and is staffed primarily by volunteers.

Municipal and town reference libraries also offered limited collections for public use in European cities as early as the sixteenth and seventeenth centuries. However, their contents are reported to have been typically limited to materials of moderate interest. As in the case of the national libraries, the collections were often bequeathed, rather than purposely purchased, and not frequently tended by librarians. Private and circulating libraries were, in contrast, more stable and provided materials of considerable interest.^[3]

NINETEENTH CENTURY LIBRARIES

By the midpoint of the nineteenth century, remnants of each of these models could be easily seen in the libraries that provided services in the United States. Proprietary and subscription libraries, such as the Library Company of Philadelphia, the Boston Athenaeum, and the Charleston Library Society were already well established and provided reading materials, including popular texts and fiction, to their members and subscribers. Mercantile and mechanic's libraries also housed collections intended for the use of young men entering business, commercial tradesmen, and aspiring artisans. In 1850, contemporary reports indicated these libraries numbered over 100, and their joint collections were thought to be in the range of 600,000 volumes.^[10] Although fewer in number today, several of these libraries, including the Boston Athenaeum, continue to provide services on a subscription basis. Technical and business libraries are also a common feature and vital factor within the business and technical communities.

Writers also link Edward Everett and George Ticknor's continental education and familiarity with the great university libraries of Europe to the establishment of the first major public library in the United States in the city of Boston. The influence of the Boston Athenaeum is also evident. Of the members of the Joint City Council

Committee appointed to consider this question and the five citizens appointed to the first Board of Trustees, the mayor, four of the appointed trustees, and five of the City Council members were Athenaeum proprietors. New perspectives concerning the value of workingmen, social and intellectual mobility, and the importance of social harmony and prosperity to an emerging nation provided additional contextual impetus.^[11,12]

Education also figured prominently in the words of those who favored the establishment of public libraries in the United States.^[13] By mid-century, the public school movement, led by Horace Mann, Henry Barnard, and others had gained substantial momentum, and the benefits of extending public education provided a persuasive argument for the establishment of equally public libraries. The growing prominence of an international scientific community based on the premise of collective advancement, acculturation issues related to an increasingly urban and immigrant population, and modern concepts related to the values of democracy and moral stewardship also pointed to a need to extend basic scholarship and educational opportunity. By the end of the nineteenth century, children's reading rooms had been opened in Brookline, Massachusetts, Minneapolis, and Denver. Publicly supported school libraries followed slowly, although in some states, including New York, funds were allocated for this purpose.

MODERN LIBRARIES

Although these categories sometimes overlap, modern libraries typically fall into one of four groupings: school, academic, public, and special.^[6,14] School library media centers are usually located within primary and secondary schools. Their collections are diverse, including children's and young adult materials intended to support classroom activities and curriculum development. School library media centers are also often technology intensive. Their services are intended to be an integral part of their school's instructional process, and their programs contribute through reading guidance and technology instruction to the personal, social, and intellectual development of the students in their schools.

Academic libraries maintain collections and provide services that further the purpose and mission of the higher education institutions to which they belong. Their collections and services are geared to promote faculty research, teaching excellence, and student learning. In recent years, academic libraries have taken advantage of new technologies through contract arrangements that allow them to purchase and provide journals, books, and other materials in electronic format directly to dorms, faculty offices, and student's homes. They also teach technology courses that introduce students to electronic classroom resources, and they often participate in shared acquisition arrangements

through university library consortia that provide some relief from rapidly rising journal prices.

Public libraries in the United States are generally tax-supported institutions with service areas that usually coincide with city and county boundaries. In other cases, public libraries are operated as special district libraries. In both cases, public libraries play a crucial role in their communities, providing services intended to meet the social, educational, and recreational needs of the people residing in their service areas. Their collections typically span the interests of all age groups. Public libraries often produce educational programs, such as the National Endowment for the Humanities Picturing America programs that bring great American art directly to schools and libraries across the United States (<http://www.neh.gov/news/archive/20080227.html>). Public libraries also forge an important link between communities and local, state, and federal government agencies by assuring access to governmental documents and providing access to information about government rules and regulations. In the United States, public, academic and school libraries share a common professional association in the American Library Association (ALA), founded in 1876.

Special libraries vary considerably, but are generally defined by a special purpose and clientele. They are common in business and industry, government, nongovernmental organizations, and associations. Special libraries generally have deep coverage of narrow subject areas of interest to their parent organization, with restricted coverage of other subject areas. Common examples of special libraries are law libraries, medical and hospital libraries, corporate libraries, and museum and research institute libraries. Government agencies, especially at the Federal level, have many specialized libraries as well. Examples of special libraries in the United States include the American Medical Association Library, the Fashion Institute of Technology Gladys Marcus Library, the John F. Kennedy Museum and Library, the Newberry Library (an independent humanities research library), the National Air and Space Museum Library, and the Mayo Clinic Libraries. They are alternatively referred to as information and knowledge centers.

Special libraries are usually funded by their parent organization to meet the needs of that organization. In private industry, the staff and resources are evaluated on the basis of their contribution to the bottom line, as well as their contributions to research, development, and operations. In 1909, special librarians in the United States founded their own association apart from the ALA, and called it the Special Libraries Association.

LIBRARY FUNCTIONS

The tasks required to provide access and services in most of these libraries are generally organized around a set of

core functions typically referred to as technical services, public services, and management. The first of these, technical services, is associated with the identification, assessment, procurement, cataloging, classification, preparation, and maintenance of the materials that constitute the collection. At this time, many of these activities are aided by automation systems and cataloging utilities. Public services include reference services, bibliographic instruction, reader's advisory assistance, community programming, and other services where library staff interact directly with those who use the library. Management functions include marketing, planning, financial management, and human resources development.

The size of these libraries and the content and complexity of their collections typically determine the size and stratification of the staff that performs these activities. However, in most cases there is at least one individual whose duties include some portion or combination of those listed under the heading of *Librarian* once developed for *Dictionary of Occupational Titles* as follows:

Maintains library collections of books, serial publications, documents, audiovisual, and other materials, and assists groups and individuals in locating and obtaining materials: Furnishes information on library activities, facilities, rules, and services. Explains and assists in use of reference sources, such as card or book catalog or book and periodical indexes to locate information. Describes or demonstrates procedures for searching catalog files. Searches catalog files and shelves to locate information. Issues and receives materials for circulation or for use in library. Assembles and arranges displays of books and other library materials. Maintains reference and circulation materials. Answers correspondence on special reference subjects. May compile list of library materials according to subject or interests, using computer. May select, order, catalog, and classify materials. May prepare or assist in preparation of budget. May plan and direct or carry out special projects involving library promotion and outreach activity and be designated Outreach Librarian (library). May be designated according to specialized function as Circulation Librarian (library); Readers'-Advisory-Service Librarian (library); or Reference Librarian (library).
—Source: <http://www.occupationalinfo.org/10/100127014.html> (accessed October 10, 2001)

In the United States, the title *Librarian* is generally reserved for individuals who hold a Masters degree from graduate programs accredited by the ALA. These programs also provide continuing education workshops that introduce new concepts and techniques to currently practicing librarians. Other staffing levels are paraprofessionals and library aids. These individuals perform many duties that are critical to library operations, including shelving, interlibrary loan, circulation, and basic reference activities.

Librarians and others who work in traditional libraries also receive support from a network of professional

associations that represent their interests, facilitate the development of professional standards, create public forums, and provide continuing education materials and opportunities. Most countries have professional library associations, as do many states and provinces. The International Federation of Library Associations and Institutions (founded in 1927) attracts members from a wide range of nations and provides similar services at the international level.

LIBRARY BUILDINGS

Library buildings vary in design and construction. They generally include spaces for their collections, electronic work stations, meeting rooms, staff work rooms, and public reading areas. New building and renovation projects tend to be ongoing, and annual data places the number of public library projects completed in the United States between July 1, 2007 and June 30, 2008, at 183 and the number of new academic libraries at 30. In the case of academic libraries, project costs for new libraries ranged from \$6,190,300 to \$92,000,000. New public library project costs ranged more widely, including project costs close to \$250,000 and \$64,000,000.^[15] Although many communities in the United States enjoy and are proud of libraries built with support from the Carnegie Foundation at the turn of the century,^[16] new libraries and renovation allow libraries to create spaces for the electronic services, children's programs, and community activities, while making their facilities more accessible in terms of the design standards provided in the Americans with Disabilities Act at 28 CFR Part 36, as revised July 1, 1994 (<http://www.ada.gov>). New buildings also provide opportunities to experiment with designs and incorporate modern "green" building materials, often with striking and award-winning architectural results (<http://www.oclc.org/pallas2.tcl.sc.edu/nextspace/010/advocacy.htm>; <http://www.ala.org/ala/mgrps/divs/llama/llamaawards/aiaalibrarybuildings.cfm>).

LIBRARY NUMBERS

While it is difficult to determine the number of entities currently providing library services due to variations in reporting procedures, information related to library operations is typically collected and periodically reported. In the United States, these data are currently provided through a cooperative arrangement between the Institute of Museum and Library Services and the National Center for Education Statistics. The most recent information available places the number of academic libraries in the United States in 2006 at 3617 with holdings estimated at over 1 billion items.^[17] The number of public libraries in 2006 exceeded 9000 with the number of library visits estimated at 1.4 billion and the number of circulation

transactions at slightly over 2 billion.^[18] Similar figures indicate that the number of public schools with library media centers in 2000 approached 77,000, representing 92% of U.S. public schools.^[19]

Similar data are collected for European libraries by LIBECON, an organization funded by the Directorate General for the Information Society of the European Commission within the 5th Framework Programme for Research. Other sources include surveys administered by UNESCO and nationally available statistics. A 2003 synthesis of data collected from these sources by the International Federation of Library Associations provides the following estimates based on service points, which are defined as any library in which a service for users is provided in separate quarters, whether it is an independent library or part of a large administration unit (http://www.uis.unesco.org/ev.php?ID=5622_201&ID2=DO_TOPIC). The data were developed using the numbers most recently reported by each country in the data set used for calculation (see Table 1).

RECENT DEVELOPMENTS AND THE TWENTY-FIRST CENTURY

As libraries developed over many centuries from a very small number to hundreds of thousands, the media they employed to record information also grew and changed significantly. In the early days and over a period of centuries, collected knowledge moved from clay tablets to papyrus to parchment to paper. More recently, over just a few decades, libraries have become homes for audio recordings, games, interactive educational materials, videos, and many other forms of digitized information that can be downloaded and accessed using computers, smart phones, and other devices. There have also been remarkable changes in library services, and many people are now using libraries differently, especially young people who have grown up surrounded by digital media.

Recently, the changes in media have focused on the concept of digital libraries, a term that became popularized

among librarians in 1993 with the publication of a special issue of the *Journal of the American Society for Information Science*. The digitized collections to which the term refers have grown in number for over a decade, and they include small projects such as the historic photographs in the South Carolina Georgetown County Library Digital Library (<http://www.gcdigital.org/browse/index.php#brookgreen>) and large collections, such as the award winning Valley of the Shadows digital library developed by the Institute for Advanced Technology in the Humanities at the University of Virginia (<http://valley.vcdh.virginia.edu>). Both of these collections are of general interest to students and adults who enjoy exploring historical documents. Personal music digital libraries are also popular, and collections of this type fold easily into and extend the traditional purposes of libraries: the identification, collection, and organization of materials in a way that makes information easily available.^[20]

In some cases, the items in digital library collections are originally created in electronic format. In others, the accession of an item involves scanning a physical object into memory and editing the image as needed to produce the highest possible quality. Additional steps include describing the properties and content of the image (adding data about the information resource, known as metadata, for effective retrieval); creating backup copies; and planning for the preservation of the image as systems, software, and standards change over time.

Many traditional “brick and mortar” libraries have also been transformed by these developments, and most are actively adding digital content, including audiovisual material, electronic journals, Web pages, and databases, to their collections for use both on their premises and at remote locations. Downloadable digitized books, self-service functions (such as book renewals and interlibrary loans), and electronic reference services delivered through e-mail or instant messaging offer patrons new levels of convenience and effectively extend these libraries, too, beyond their physical confines.

Innovative libraries are also using a wide range of Web 2.0 technologies, including social networking platforms, podcasts, mashups, and gaming to maintain the centrality of their positions within their communities and foster interactive learning. Building on the popularity of MySpace, Flickr, Wikipedia, and YouTube, these libraries have developed new forms of library programming that extend the walls of traditional libraries and enrich their interiors with opportunities to create knowledge and foster digital learning in an environment that matches busy lifestyles and connects people to people around the world. Digital media and learning is of particular interest to the John D. and Catherine T. MacArthur Foundation (http://digitallearning.macfound.org/site/c.enJLKQNiFiG/b.2029199/k.94AC/Latest_News.htm), and libraries such as the Kankakee Public Library in Illinois are exploring these new library technologies (<http://www.kankakee.lib.il.us/>).

Table 1 Libraries serving the public.

Region	Public	Education	School	National	Total
Library service points					
Africa	797	266	51	15	1,129
Asia	37,063	6,909	29,992	66	74,030

Abstract

Library and information science (LIS) is an interdisciplinary domain concerned with the creation, management, and uses of information in all its forms. Emerging from parallel developments in libraries and in information science, the field now encompasses diverse activities that are part of the information transfer cycle—such as the creation, instantiation, communication, acquisition, organization, management, regulation, preservation, distribution, and use of information. This entry traces the development of LIS from its beginnings in thinking about libraries and the growth of library science as a field. It then explores the nature of information science and the interweaving paths of the two—which eventually encountered the field of communications. The entry concludes with current trends and emerging areas in the field that present both challenges and opportunities in terms of defining LIS as a vast, interdisciplinary area.

INTRODUCTION

Library and information science (LIS) is an interdisciplinary domain concerned with the creation, management, and uses of information in all its forms. Taught in colleges and universities at the undergraduate and graduate levels and a subject of research in both industry and academia, LIS brings together a variety of theoretical approaches. Its focus is on representations of information—the documentary evidence of civilization—as well as on the technologies and organizations through which information becomes accessible.

The research domain is young, beginning in the late 1960s and early 1970s, but its roots lie in the nineteenth century. As can be seen in Fig. 1, LIS represents the intersection of library science, information science (originally called documentation), and communications. The first, library science, has sought to solve the problems of organizing and providing access to collections of materials. The second, information science, seeks to understand the properties of information and how to manage it. Aspects of the field of communication, always a facet of the first two, became interwoven with both as library science and information science matured and increasingly intersected with one another.

The field of LIS can be characterized as “user-focused.” The concern is not just for the isolated information artifact—for example, data, reports, books, video, and museum objects. Instead, the social, technical, and cultural systems that structure recorded knowledge, making it available and useful to the people who want or need it—or even happen upon it—are considered. Historically LIS

has focused on technical systems, such as cataloging and classification, as well as organization systems such as the development and management of collections and user services. Legal systems that structure information access such as licensing, intellectual property rights, and information policy are central to the domain, particularly in the current information landscape that relies heavily on digital information and Internet technologies. LIS researchers also study ways in which the use of indexes, citations, and other bibliographic information can reveal such things as the relationship between disciplines, networks of scholarship, and the value of information in decision-making. LIS encompasses research on the social and cultural contexts of information, considering implications of race, ethnicity, class, gender, and sexuality for information creation, transfer, and use. Such questions lead beyond the initial concerns of the field, demonstrating the flexibility of LIS to meet the changing role of information in society.

The LIS domain extends to the structures of the institutions that make information available and usable—such as libraries, archives, and museums, whose primary purpose is collecting, preserving, organizing, and making useful information and cultural artifacts. The field also includes systems—such as information resource management—within business and organizations.

LIS grew out of philosophies of the Enlightenment. Its foundations were built in the United States in the late eighteenth and throughout the nineteenth century. Thomas Jefferson, James Madison, and other founders viewed both libraries and information as important to the new democracy. The Library of Congress was established in 1800

Fig. 1 The domain of LIS.

during the administration of John Adams; article 1, section 8 of the Constitution established copyright protection to “promote science and the useful arts.” Government support for the U.S. mail system, including roads over which the mail was carried, and for national surveys (including the Lewis and Clark expedition) are among the ways in which the new federal government promoted the creation and dissemination of information.

During the nineteenth century, scientific discovery and exploration grew rapidly, fueled by government subsidies and industrial growth. The U.S. government published 100,000 different titles between 1774 and 1881,^[1] and the Government Printing Office printed 41 million copies of their publications by 1894. Research universities and library collections grew exponentially. Between 1850 and 1875, local communities and philanthropists created 2240 public libraries.^[2]

FOUNDATIONS: 1880–1960

Library Science

Libraries are collections of recorded knowledge, organized for use. Libraries may exist in buildings of bricks and mortar or as digital collections held in the memory of one or more connected computers. Whatever the form or format, libraries are intended to provide access to cultural and scientific materials for an audience—for users who will take that information for enjoyment, increased understanding, or as the basis for creating new information.

The nineteenth century was a productive period for the development of tools for organizing information. These included William Frederick Poole’s (1821–1894) *Index to Periodical Literature*, begun in 1848, and several important indexing and abstracting services, among them *Index*

Medicus (1879) and *Engineering Index* (1896). The *Library of Congress Classification* and *Dewey Decimal Classification* systems were developed in the late nineteenth century to help manage the growth of library collections. By the early twentieth century, the Library of Congress published catalog records from their collections for use by other libraries, a practice that encouraged standardization in library practice and contributed to the possibilities of automating library work.

In 1887 library science took the first step from education by apprenticeship—the usual way one gained occupational competence in nineteenth century America—to an academic area within higher education. Melvil Dewey (1851–1931) created the School of Library Economy at Columbia University in 1887.^[3–4] At its inception, library science focused on history and bibliography—the description and classification of recorded knowledge. (These areas remain the primary focus of library science in many countries, particularly those countries formerly associated with the Soviet Union.) The academic field did not begin to develop until the Carnegie Corporation funded two critical studies on the quality of library science education. The second of these, *Training for Library Service* (1923), by Charles C. Williamson (1877–1965), is often credited with bringing about the changes necessary for library science to become a mature academic field.^[5]

In 1926 the Carnegie Corporation provided funding to create the Graduate Library School (GLS) at the University of Chicago. It was the first such program to offer a doctoral program and played a significant role in opening the field to change during the 1930s. Library science became more interdisciplinary and began to develop deeper theoretical foundations and more substantive research. The GLS faculty included Pierce Butler (1884–1953), Douglas Waples (1893–1978) and, for a time, Bernard Berelson (1912–1979) who received his doctoral degree from the GLS in 1941. These three applied various methods from the social and behavioral sciences to the examination of libraries. Their differing views were widely influential, partly because of their doctoral students and partly because of their research, including *The Library’s Public* (1949), of which Berelson was a principal author. The monograph was one of seven resulting from a significant social science investigation known as *The Public Library Inquiry*.

Two of those Chicago graduate students became faculty colleagues at Western Reserve University. Dean Jesse Shera (1903–1982) and Professor Margaret Egan (1905–1959) played a critical role in bringing the bibliographic history of library science together with communication. In a classic 1952 article,^[6] they argue that bibliography has a social purpose: an approach they called “social epistemology.” Bibliography does not exist for a small group of users, but is the way in which graphic communications move through society and contribute to shaping that society.

Information Science

Information Science is concerned with information itself and its representations—what information is; how to represent it; how to understand its functions; how it is used; and how to design systems to organize, classify, and retrieve information. Noted information scientist Harold Borko stated, it “is that discipline that investigates the properties and behavior of information, the forces governing the flow of information, and the means of processing information for optimum accessibility and usability.”^[7]

The history of information science embodies technological developments, notably those in computing, theoretical advances in mathematics and finding ways to measure information, and innovations in retrieving information for research and scholarship. Historically, much of the work of information science was concerned with scientific, technical, and medical information.

Belgian lawyer Paul Otlet (1868–1944) is credited with identifying the field of documentation, a term more commonly used in Europe and the precursor to the phrase “information science.” With his colleague Henri La Fontaine (1854–1943), Otlet founded the Institut International de Bibliographie in 1895 and created the multilingual *Universal Decimal Classification* (1905). Both were created to provide universal access to all recorded knowledge, to support Otlet’s ambition to promote world peace.

It was not until the founding of the American Documentation Institute (ADI) in 1937 by Watson Davis (1896–1967) that the field began to coalesce in America. Prior to its founding, developments in information science were primarily the result of individual invention, such as the Hollerith punch cards for sorting data or independent organizations, and work of scholarly societies like the American Chemical Society. Originally a service organization with particular interest in microform technology, ADI’s membership began with representatives from the government, professional societies, and foundations concerned about similar problems in information management. With a particular interest in scientific communication, ADI fostered collaboration among its members and sponsored research. In 1952, ADI also became a professional society by admitting individual members.

Most of the early developers of documentation and information science had a background in science and industry, and were involved in trying to solve problems of managing large amounts of data and information resources, often for the government. A driving force for their work was scientific research and development during and after World War II, with the attendant growth in the publication of scientific information. The military and defense industries provided significant funding not only for technical but also theoretical research in information storage and retrieval.

Information science historians often credit two researchers with post–World War II advances in their field. The first, Vannevar Bush (1890–1974), described his conception of the memex system, outlined in *As We May Think*.^[8] The system, based on microform technology, was intended to make human knowledge easily and widely accessible. Contemporary scholars note that Otlet promoted many of Bush’s ideas earlier, but it is Bush who has received most of the credit for anticipating the development of the World Wide Web and other contemporary technologies.

The second was Claude Shannon (1916–2001), whose 1948 paper *A Mathematical Theory of Communication*^[9] provided the foundation for information scientists seeking to quantify information and to understand its properties. His book, written with communications researcher Warren Weaver (1894–1978), also entitled *A Mathematical Theory of Communication*,^[10] became the basis for significant research and change in social science work in communication. The field of LIS expanded well beyond these original models as it embraced the field of communications in its broader forms.

Communications

Literacy, book history, reading—tools for communicating history, culture, and information—have always been inextricably connected to libraries. By the late nineteenth century, librarians were considering their role in communicating with users, not just conserving materials. At the first American Library Association conference in 1876, for example, Samuel Green (1837–1918), then director of the Worcester Free Public Library, presented a paper entitled “The Desirability of Establishing Personal Intercourse and Relations between Librarian and Reader in Popular Libraries.”^[11] As early as 1910 librarians conducted studies of the types of books their users were reading; such studies became common in both the United States and Europe.

Both library science and documentation were historically thought to be related to communication, but communications research did not begin to mature until the 1940s. Histories of communication frequently mention the contributions of University of Chicago Professor Douglas Waples’ studies of reading conducted in the 1930s and 1940s. One of the areas of research in The Public Library Inquiry was *The Effects of the Mass Media* (1949)—a study on what was happening to popular taste and its effects on book reading and other library-related matters.

In 1955, Western Reserve University created the Center for Documentation and Communication Research with an explicit intention to bring those two disciplines—information science and communications—together. Allen Kent (1921–) became associate director of the Center, performing important experiments in information

retrieval before moving to the University of Pittsburgh (1963) where he established the Department of Information Science in 1970. It would not be until the 1960s and 1970s that researchers began significant research representing communication, library science, and information science linked together.

EMERGENCE OF LIS

LIS theory and research coalesced over the last 40 years of the twentieth century. It was a time of rapid technological development that made more complex both managing information and making it accessible. In the early 1960s, works like Marshall McLuhan's (1911–1980) *Gutenberg Galaxy* (1962) and Fritz Machlup's (1902–1983) *The Production and Distribution of Knowledge in the United States*, (1962) spurred public imagination about the role of information in society. The problems of classifying and organizing data, of creating tools for retrieval, and of designing them so they could be used became the concern of many other researchers disconnected from the LIS community. Responses by a number of the U.S. and European library schools to this implicit challenge became important to LIS development.

In the early 1960s, two U.S. LIS schools developed research centers: the Library Research Center at the University of Illinois (1961) and the Institute of Library Research at the University of California (1964). Each provided research opportunities for faculty and student. At the University of Sheffield, England, the Centre for Research in User Studies (CRUS) within the Postgraduate School of Librarianship and Information Studies (1976) provided a similar foundation.

Federal funding for doctoral studies in LIS and for research in both LIS increased dramatically beginning in the 1960s. Over less than a decade, the profile of LIS faculty shifted dramatically with an increasing number holding doctoral degrees and actively engaged in research.^[12]

Some of the leading post–World War II information scientists left government, business, and industry for faculty positions in LIS. Besides Allen Kent's association with Case Western and Pittsburgh Universities, other examples are Robert Hayes (1926–), president of Advanced Information Systems joining the University of California at Los Angeles's faculty, Pauline Cochrane's (1929–) move from the American Institute of Physics to Syracuse University (1966), and F.W. Lancaster's (1933–) recruitment to the University of Illinois in 1970 after experience with the Cranfield Experiments (1962) and the *MEDLARS Evaluation Project of the National Library of Medicine* (1965–1968).

Cross-disciplinary faculty teaching was equally enriching to LIS programs. Stanford University communications professor William Paisley taught, for example, at

Berkeley's School of Librarianship. Doctoral students from Syracuse University's newly named School of Information Studies took advantage of computer scientist Gerald Salton's lectures at Cornell University.

Most significant for what LIS has become today was not, however, the addition of information science to the library science curriculum, but LIS's shift away from a focus on libraries and scholarly communication to one on information. Research ranged from that on information retrieval to the accuracy of reference service. Throughout the 1970s many of the schools, formerly considered "library schools" added the word information to their name and broadened their curricula. In 1968, the American Documentation Institute became the American Society for Information Science. In 1970, a U.S. Government agency, The National Commission for Library and Information Science, was formally charged with research and policy regarding the two.

Robert S. Taylor (1919–2009), who in 1972 became dean of what is now the School of Information Studies at Syracuse University, led the evolution of LIS from a library-centered field to one that revolves around the cycle of information transfer (see Fig. 2). In this model, LIS is concerned with all of the processes and institutions that finally make recorded knowledge available and accessible. These include not only the publication of scholarship and creative works, but also information storage and retrieval and libraries as a medium of distribution. Information transfer depends, for example, on social policy, including copyright law and censorship activities; it depends on the design of buildings or websites and user education to make information easy to use, and on the coding and formatting of electronic materials so they might be retrieved. The adoption of this new model was not immediate and has not been adopted by all LIS schools, but it represents what LIS has become as a domain.

The use of information and its users has become a central concern of the domain in the process of this shift.

Fig. 2 The information transfer cycle.

Research of communication scholars like Paisley and Brenda Dervin (1938–) and their students became increasingly important to LIS research. Dervin and Nilan's seminal 1986 article^[13] identified the shift in LIS research, building on Taylor and Paisley, to widespread concern about information needs, seeking, and use. This more theoretically grounded research has led LIS education toward its user focus.

A particularly rich example of this change is the work of information behavior researchers who are both interdisciplinary in their theoretical approaches and also in the community of scholars with which they associate. Their work is presented at Information Seeking in Context (ISIC) conferences as well as in information science journals such as the *Journal of Documentation* and the *Journal of the American Society for Information Science and Technology*. This research stream has matured well beyond Shannon and Weaver through the work of such theorists as T.D. Wilson (models of information behavior), Brenda Dervin^[13] (evolving sense-making theory), and Carol Kuhlthau^[14] (information search process). Chun Wei Choo has provided one integrated model of information behavior research.^[15]

As the field became more theoretically grounded, interdisciplinary ties among researchers were strengthened. One important way that these linkages have been expressed is through the institutional structuring of LIS education, with some LIS programs being housed in schools or colleges of education or communication. For example, in 1982 Rutgers Graduate School of Library and Information Studies merged with the School of Communication Studies and the Department of Urban Journalism to form a new School of Communication and Information. Currently, there are approximately 15 accredited LIS programs following similar institutional models as part of education or communication schools and colleges. These interdisciplinary mergers are often controversial from a domain perspective, though they can serve to highlight some of the shared values across LIS and sister disciplines. In terms of LIS and communication fields, there are particular synergies to be found between LIS and journalism, both of which share a mission of training professionals according to an ethical code; value access to information; and are highly responsive to a rapidly changing information technology landscape.

Equally important, as the field has become more theoretical, LIS research has become cumulative and deeper, utilizing a diversity of theories and methods that were not historically emphasized in the discipline. For instance, the inclusion of theoretical approaches from critical studies, cultural studies, ethnic studies, and gender studies has helped LIS researchers approach domain-specific problems from new perspectives. These perspectives serve important functions in privileging under-represented voices in the field, surfacing counter narratives, and revealing the ideological commitments undergirding LIS

technologies and practices as in Hope Olson's^[16] work on gender and classification.

Shifting away from libraries as the center of LIS research and education did not remove libraries from the domain. Library and information science is built on such areas as cataloging, classification, and collection development that derive from library research, theory, and practice. Libraries, both virtual and concrete, are critical repositories of information in all forms. At the same time the shift in LIS programs starting in the 1970s has highlighted longstanding tensions between library science and information science. The signature for librarians is their code of ethics that emphasizes a commitment to intellectual freedom, resistance to censorship, user privacy, and equity of access to information. Information science, with its roots in business and industry, is without such a commitment. Some librarians express concerns that LIS has abandoned them by removing libraries from their center and, in the process, abandoning professional norms. Of particular concern is whether LIS programs adequately prepare students for practice in libraries.

LIS educators historically have sought to analyze and improve professional practice in libraries. That has not diminished today, although important developments of research in information retrieval, human–computer interaction, and other such areas may be invisible in day-to-day practice. Most visible and immediately important to librarians is work such as that of Kuhlthau (1937–)^[14] on the information search process of users. Notable also are the strong contributions to the practice of reference, including the work of Dervin and Dewdney,^[17] Durrance's many works on community information needs and services, and most recently analyses of the return on investment in public libraries carried out by Jose-Marie Griffiths and Donald W. King (1932–).

The growth of the Internet and of digital collections have reinforced the continued importance of libraries to LIS. They also made LIS an increasingly attractive target of opportunity for disciplines outside LIS. In 1996 the National Science Foundation (NSF) awarded the first round of four-year grants under its “digital library initiative.” The purpose of NSF was to “dramatically advance the means to collect, store, and organize information in digital forms, and make it available for searching, retrieval, and processing via communication networks—all in user-friendly ways.” The initiative, lasting eight years, along with a similar joint effort of NSF and the Joint Information Systems Committee in the United Kingdom, advanced research in LIS, stabilized the domain, and enhanced collaborations outside traditional LIS schools.

Federal funding for LIS in the 1960s and 1970s helped transform LIS in the United States by spurring research and doctoral study. Similarly, funding in the 1990s later contributed to expanding the domain of LIS and provided strong incentives for other disciplines to take up problems in LIS. Andrew Abbott's 1988 study, *The System of*

Professions,^[18] remains one of the most cogent sociological analyses of the challenges LIS has faced.

In 2005 a group of university programs in LIS, informatics, computer science, communications, and public policy formed the “iSchools caucus” which governs the iSchools organization, currently over 55 member schools, internationally. The website of the caucus refers to their focus on “iField,” an academic area of study and professional preparation in the intersection of technology, information, and people. Almost two-thirds of caucus members offer a program to prepare librarians that is accredited by the American Library Association. The focus of the iSchools, however, is on the broad domain knowledge of LIS. The iSchools reflect a movement to rebrand LIS as an “information” field, which remains widely debated in the field. Some librarians and library researchers fear that the rebranding represents a move toward higher status corporate partners, potentially marginalizing the position of libraries as a public good and threatening the core mission of service in the profession.

THE PRESENT

Throughout LIS’s history of creating and establishing itself, scholars have debated such questions as how to define information and communication and whether there is evidence that the related fields are truly converging. These questions are beyond the scope of this entry. Despite the debates, LIS teaching and research continues to expand into newly developing areas of information organization and use. Among those areas of expansion are discipline-specific applications of informatics—for example, medical informatics, social informatics, and community informatics—the study of design, application, and use of information technology within specific domains. Another domain-specific area of development is data curation—the management of data through the information transfer cycle including data creation, management, preservation, and use. The fields of application are new, but essentially replicate in new disciplines approaches that historically were applied to libraries, and information retrieval research is now addressing issues in digital humanities that raise new questions about ontologies and retrieval of text.

CONCLUSION

The field of LIS began in the United States; it grew initially out of the interaction of library science and information science. Although the development of LIS in countries outside the United States has been constrained by different educational systems, scholars particularly in the Nordic countries and Britain have conducted significant LIS research, notably in the Department of Information Studies

at Sheffield University (England) and the Danish Royal School of Library and Information Science. Within the past two decades, both Finnish and Norwegian universities have created schools and departments apart from library education devoted to information science.

In the United States, a wide range of Federal agencies, foundations, and businesses now support LIS research. These reflect the new questions being raised in both teaching and research within the domain. In early 2015, a conference sponsored by the Institute of Museum and Library Services focused on “Re-visioning Library and Information Science Education.” Bringing together leaders from the multiple domains of LIS, the conference considered trends shaping LIS and LIS education such as the growth of digital content, social media, search tools, big data, mobile technologies, diversity, and globalization. This conference reflects a strong commitment within LIS to “not only keep pace, but take the lead.”^[19]

Library and Information Technology Association (LITA)

Rachel E. Vacek

University of Michigan, Ann Arbor, Michigan, U.S.A.

Abstract

The Library and Information Technology Association (LITA) is a division of the American Library Association (ALA), established in 1966. Through publishing, programs, training, national conferences, and strategic partnerships, LITA educates, serves, and reaches out to its members, ALA members and divisions, and the entire library and information technology community through the promotion and implementation of library automation and technology.

INTRODUCTION

The Library and Information Technology Association (LITA) is a division of the American Library Association (ALA). The division began in 1966 as the Information Science and Automation Division (ISAD) and became LITA in 1972. LITA's mission statement, adopted in May 1999, begins with its strategic mission "to educate, serve, and reach out" to the library community through the use and promotion of information technology. LITA celebrated its fiftieth anniversary in 2016.

LITA VISION

As the center of expertise about information technology, LITA leads in exploring and enabling new technologies to empower libraries. LITA members use the promise of technology to deliver dynamic library collections and services.

LITA MISSION

LITA educates, serves, and reaches out to its members, other ALA members and divisions, and the entire library and information community through its publications, programs, and other activities designed to promote, develop, and aid in the implementation of library and information technology.

FUNCTION STATEMENT

LITA is concerned with the planning, development, design, application, and integration of technologies within the library and information environment, with the impact of emerging technologies on library service, and with the effect of automated technologies on people. Its major

focus is on interdisciplinary issues and emerging technologies. LITA disseminates information, provides educational opportunities for learning about information technologies and forums for the discussion of common concerns, monitors new technologies with potential applications in information science, encourages and fosters research, promotes the development of technical standards, and examines the effects of library systems and networks.

MEMBERSHIP

LITA membership (Table 1), like any organization, has increased and decreased over the course of its existence. Although LITA was established in 1966, members were not able to join until 1967. Initial membership started at 2334 people, and LITA membership peaked in 1993 with 5802 members. LITA's membership, like all the other ALA divisions, has been in decline since the early 2000s.

GOVERNING STRUCTURE

LITA is governed by a Board of Directors headed by the president (Table 2). In addition to the president, the Board includes the vice-president/president-elect, the immediate past president, the LITA/ALA councilor (representative of LITA on ALA's governing council), and seven directors at large. Ex officio members include the executive director (Table 3) of the division, the chair of the Bylaws and Organization Committee, and the chair of the Financial Advisory Committee.

The Executive Committee of the board is composed of the president, the vice-president, the past president, the LITA/ALA councilor, and one director chosen by the board each year, with the executive director being an ex officio member. The Board of Directors meets virtually and at every ALA Annual and Midwinter Conference, as

2001	4,910
2000	4,757

does the Executive Committee. In addition, the Executive Committee meets virtually every spring and in-person in the fall near the ALA headquarters in Chicago, IL. The functions of LITA are carried out by approximately 50 committees and interest groups, most of which conduct business and hold meetings virtually, as well as at every ALA Conference.

HISTORY

Early Years

LITA's history, through approximately 1973, was delineated in the first edition of the *Encyclopedia of Library and Information Sciences*; the entry was entitled "Information Science and Automation Division (ISAD)." Going back to its earliest incarnation as the autonomous and unaffiliated "Coalition on Library Automation (COLA)" in the early 1960s, the group that would lay the foundation for today's LITA grappled with an issue that is still with the division today, that is, interest in technology runs across existing ALA divisions and types of libraries. From its inception, LITA has maintained a balance of service to other divisions, the library technology, and vendor community, and the ALA membership as a whole. To that end, LITA has consistently worked to develop and maintain a flexible, adaptable structure that focuses on facilitating education and information exchange to help those interested in the use of computer technology in library and information-related organizations to better perform their work.

In the same year as the retirement of ISAD's first executive secretary, 1973, then division president Ralph Shoffner appointed an Objectives Committee chaired by Stephen Salmon, ISAD's first president, to determine whether the division should continue. Concluding that the division's functions warranted continuation, new

Following the restatement of purpose, and with the approval of the membership, ISAD changed its name to the Library and Information Technology Association. Various early division periodical publications were subsumed in 1973 into the referred *Journal of Library Automation (JOLA)*. In 1982, the journal's editors selected a new name more reflective of the name change of the division and *JOLA* became *Information Technology and Libraries (ITAL)*; Table 4). A *LITA Newsletter* was published from 1979 to 2000. Issues from Spring 1995 to Summer 2000 were published electronically, with issues from Winter 1997 to Summer 2000 being available only in electronic format. An abbreviated supplement, *LITA Notes*, was published as part of *ITAL* from 1997 through March 2000. The *LITA Newsletter* editors included Pat Barkalow, Carol Parkhurst, Walt Crawford, Gail Junion-Metz, and Martin Kalfatovic. Since 2000, the LITA news function has been subsumed by the divisional website and blog, as well as periodic electronic mailings to the membership.

With the goal of greater member participation in the division, and with objectives and a name change firmly in place, LITA underwent a major reorganization in 1984–1985. Many of the committees were restructured, and LITA went back to its COLA discussion group roots to encourage the creation of varied interest groups. Ten or more LITA members could petition to form an interest group in a library/information technology topic; if the

interest group's formation was approved—and the vast majority are to this day—by the LITA Board, the group can elect officers, organize discussions, put on programs, create publications, and perform other educational and information exchange functions. New interest groups are formed and disbanded on a regular basis; at any given time, 15–20 interest groups are active in the division. This model reflects the ever-changing landscape in information technology.

Another major initiative that began in the late 1970s/early 1980s is the provision of sponsored awards and scholarships that support achievement and study in library and information technology. Stemming from this time period are the LITA/Gaylord Award for Achievement in Library and Information Technology, LITA participation in the multidivisional Hugh C. Atkinson Memorial Award, and the LITA/Computer Library Services, Inc. (later the LITA/GEAC) scholarship to encourage entry into the library automation field.

High demand for workshops and face-to-face discussions also led to the creation of National Conferences in the 1980s and 1990s. These large-scale multiple-day gatherings involved presentation of papers, vendor exhibits, workshops, and computer demonstrations. The national conferences in Baltimore (1983), Boston (1988), and Denver (1992) were well attended and financially successful.

The Internet Era

Trends within the LITA division can be tracked along with those throughout the other divisions, libraries, and even the world at large. These trends and influences include the decline of the spending power of libraries, an increasingly rapid pace of change in technology, the growing attention to empowering diverse population groups, the advent and spectacular growth of the Internet as a worldwide network, the rapid improvements in computing power, and a resulting exponential increase in the amount of available electronic content.

As it became clear that no area of libraries—and no type of library—would be untouched by information technology, and, therefore, that most library organizations became concerned by technology topics, LITA shifted its focus and identity to leadership in the more advanced use of technology in libraries and other related organizations. The 1990s also cemented the role of systems librarians—degreed professionals with added expertise in hardware, software, networks, and computing—establishing LITA as the logical division for these professionals' participation. LITA also emerged as a home for a growing number of information science and IT professionals who are not librarians.

In 1996, the supposed last LITA National Conference was cosponsored by the Library Administration and Management Association division and held in Pittsburgh,

Pennsylvania. Despite good attendance and feedback from participants, the expenses and the 3-yr planning cycle of the endeavor led LITA to determine that this was not the best method for continuing its own major conference. In 1998, LITA had its first annual National Forum. Taking place in Oakland, California, the more focused format was an immediate success. Education opportunities, attendee satisfaction, divisional revenue, and the development of training opportunities through regional institutes and preconferences continue to make LITA Forum a popular annual event (Table 5).

LITA became an early supporter of the move to encourage diversity in the library profession by creating the LITA/OCLC and LITA/Library Systems and Services, Inc. minority scholarships in Library and Information Technology. Additional awards and scholarships created in the 1990s have included the LITA/Ex Libris Student Writing Award, the Frederick G. Kilgour Award for Research in Library and Information Technology (jointly sponsored by LITA and OCLC), and the LITA/Christian Larew Memorial Scholarship (sponsored by Baker & Taylor). The LITA/Library Hi Tech Award (sponsored by LITA and Emerald Press) rewards innovation and scholarship in library technology. Awarded each year, these competitive awards not only engage the partnership of sponsors, but give a meaningful leg up to new professionals and reward those most active in library technology. The LITA/Brett Butler Entrepreneurship Award (sponsored by LITA and Gale) was retired in 2009.

LITA was also a pioneer among library associations in the area of electronic communications. An electronic edition of the *LITA Newsletter* was first published in 1995. The first electronic-only serial publication by a division of ALA, Telecommunication Electronic Reviews (TER), appeared in 1994 and spawned many imitators. In 2009, LITA retired TER in favor of community-based blog and wiki communication platforms. LITA garnered the thanks of ALA members at large by originating Internet rooms at ALA conferences, setting up and managing the Internet rooms at seven ALA Annual and Midwinter conferences from 1993 through 1996.

In 1996, the LITA website, <http://www.lita.org>, was created, as was the LITA electronic discussion list, LITA-L. In 1998, LITA created an online jobs list—"Jobs in Library and Information Technology" that has been heavily used by job posters and job seekers since then.

Twenty-First Century

With the advent of weblogs, social software, and group-edited wiki sites, LITA established an online presence for open participation and discussion of library technology issues with its LITA Blog (litablog.org) in 2005 and LITA Wiki (wikis.ala.org/lita) in 2006. Many of the members instrumental in establishing a foothold with these technologies established the Blogs, Interactive Groupware Wikis Interest Group (BIGWIG). In 2008, BIGWIG launched Your BIGWIG (yourbigwig.com) and established itself as the leading social software discussion group within ALA. BIGWIG hosted the extremely well attended Social Software Showcase, an "unconference" that occurred both virtually and physically at every ALA Annual Conference. However, as more structure for social technology was needed within LITA, and as other divisions, roundtables, committees, and interest groups embraced social software, BIGWIG's purpose had been served, and in 2011, the interest group retired.

In 2009, ALA had also created a new tool called ALA Connect (connect.ala.org), which was intended to be the centralized space where both unofficial and official ALA groups are able to work together online. This content management system, built on the open-source Drupal platform, greatly impacted LITA. Having multiple web-based tools for different purposes can be helpful, but managing content and having working spaces across a blog, wiki, website, and within ALA Connect seemed to be a few too many places. It became unclear on each tool's purpose. It was decided in 2011 that the LITA Web Coordinating Committee would manage the Blog and Wiki. Then in 2012, the Wiki was retired and LITA members were encouraged to use ALA Connect as a workspace for all committee and interest group business.

ALA Connect has also served the LITA Board and Executive Committee as a place to organize and share meeting notes, vote on issues, and engage with the

community in new ways. Posts can be marked as public or private, and users can add comments, attachments, create polls, make meeting time requests, or even chat, all within ALA Connect. It has significantly helped make more accessible the intuitional memory of LITA's digital presence.

During the mid-2000s, capturing and then immediately sharing the digital recordings of speakers, board meetings, and major events like the Top Technology Trends, the President's Program, or keynote speakers at the LITA Forum became extremely important to LITA. Travel to conferences was financially challenging for many people at this time due to library travel funds being reduced or cut completely. Consequently, the desire to participate virtually (such as watching a live stream while discussing the event through a Twitter backchannel) was increasing. Many of LITA's educational events were streamed live, or were recorded and made available at later times. Jason Griffey, LITA Board Member (2011–2014), was the primary source for audio and video equipment, provided the recording expertise and posted the digitized events for LITA for most of the past decade.

During the late 2000s, LITA's online presence continued to expand. LITA engaged and informed current and potential members on social media sites like YouTube, Twitter, and Facebook. Additionally, more educational opportunities were being created for virtual consumption. Perhaps the most significant online transition was that of LITA's peer-reviewed journal, *Information Technology and Libraries (ITAL)*, which moved from a print format to a free journal with unrestricted online access. The transition to being an open-access journal took approximately 2 yrs, between 2010 and 2012. Embarking on an e-publishing model only has helped ensure the long-term viability of *ITAL* by making it more accessible, more current, more relevant, and more environmentally friendly. *ITAL* continues to feature high-quality articles that have undergone a rigorous peer-review process, but it also expanded content to include more case studies, commentary, and information about topics and trends of interest to the LITA community and beyond. Although many LITA members helped with the open-access transition, key people included Kristin Antelman, Bob Gerrity, Maurice York, and Michelle Frisque.

Over the past 15 yrs, almost all the divisions of ALA experienced financial challenges and saw a trend of flat or declining membership, and LITA was no exception. In 2012, the LITA Financial Strategies Task Force was established under President Zoe Stewart-Marshall (2012–2013) to reexamine existing financial strategies and revenue sources for the Division and identify strategies based upon a sustainable infrastructure to allow LITA to continue to provide valued networking and educational opportunities by and to its members. Their final report, full of short-term and long-term recommendations, was presented to the Board in early 2014. Later that year,

under President Cindi Blyberg (2013–2014), the Financial Advisory Committee was established. Many of the recommendations will continue to be reviewed and implemented in years to come.

In addition to creation of the Financial Advisory Committee, other changes were made to LITA committees in the 2000s and early part of the decade. In 2008, the Assessment and Research Committee was formed to work with other LITA groups to assess progress against the strategic goals through the collection and assessment of data and feedback. This committee, like many others, originally started out as a task force that was charged to conduct research and present a final report to the Board with future recommendations.

In 2012, a Metadata Standards Committee was established that has appointed membership from LITA, the Association for Library Collections & Technical Services, and the Reference & User Services Association. In 2014, the Board voted to disband both the International Relations Committee and the Technology and Access Committee because much of the work of these committees was being done at the ALA level, and these committees had been created at a time when there was not as much focus on these topics in libraries.

Later in 2014, president Rachel Vacek saw the need to help LITA streamline, improve branding, and more effectively communicate across LITA's virtual presence and proposed to the Board a committee to help with these efforts. In October 2014, the Communications and Marketing Committee was created. To compliment these communication efforts, the Web Coordinating Committee also hired a blog manager, Brianna Marshall, who along with a dozen dedicated blog writers, have a goal to revitalize LITA's blog and social media presence. In a short few months, organic reach and engagement had explosive growth and positive feedback from members and non-members alike.

STRATEGIC FUNCTIONS AND MAIN PROGRAMS

In 1998–1999, under the presidency of Barbra Buckner Higginbotham and the leadership of president-elect and future ALA president Michael Gorman, LITA went through a process of reexamining its strategic directions, resulting in a sharpened and renewed focus on educating, serving, and reaching out. Many LITA activities fulfill more than one of these objectives that help LITA maintain its status for IT leadership within ALA in particular and libraries in general.

Under the initial leadership of president Colby Riggs (2004–2005), the LITA Board of Directors approved its first detailed strategic plan for the years 2005–2008. Establishing the Mission, Vision, and Function of the division, the plan set a tactical objective to fulfill its strategy to educate, serve, and reach out, established in the late 1990s.

President Michelle Frisque (2009–2010) and the LITA Board led the creation of LITA's second ambitious strategic plan for the years 2008–2011 that focused on the organization, innovation, training and continuing education, collaboration and outreach, and advocacy and policy. Input was gathered through surveys, open forums, and the LITA Town Meetings at ALA Midwinter conferences. From 2013 to 2015, the work of the LITA Board focused on four goal statements from the previous Strategic Plan. The division's principal focus on education, publishing, and networking remained the same, but other ideas including collaboration, advocacy, and infrastructure were incorporated. These concepts have been central to the Board's and the membership's work over the past several years and reflect the LITA gestalt.

EDUCATION

In the area of education, LITA presents 15–20 programs at every ALA Annual Conference on a wide variety of technology-related topics, such data management, linked data, web analytics, search engine optimization, user experience, digital libraries, graphical information systems, and languages like Python or XML. Popular programs, such as Top Technology Trends, the Ultimate Debate, and the President's Program draw large crowds and are immensely popular. In addition, two preconferences are scheduled along with every Annual Conference, allowing more in-depth presentations of specific topics. Such day-long workshops are also sometimes presented as regional institutes, as previously noted, often in partnership with other associations and agencies. The annual LITA National Forum is perhaps the most popular educational venue.

However, despite all success of the in-person educational offerings, the advent of new technologies has also given LITA the opportunity to create new strategies for virtual education, unconstrained by time and place. These strategies have created numerous opportunities for members and nonmembers alike. Webinars and online courses taught over the course of multiple weeks and utilizing Adobe Connect, a web conferencing platform, have become increasingly popular and have become a great revenue-generating avenue for LITA to explore more and expand.

LITA's publications have long served as a source of excellent education in library and information technology. In addition to the open-access periodical, *ITAL*, almost since its inception, LITA has published monographic works of great value to the library and information technology community, and many LITA members are active in library science publishing. A drop-off in the production and profitability of monographic publishing has led LITA to focus on the publication of brief, practical, useful handbooks—*LITA Guides*—for the use of technology in

libraries and related institutions. *ITAL* continues to attract serious scholarly additions to the field of library automation, digital libraries, systems, and web technology.

SERVICE

Of course, the efforts listed under the function of education can also be considered part of LITA's service objective. The LITA website has become the focus of LITA's provision of services to the library and information technology community. In addition to the previously mentioned online "Jobs in Library and Information Technology" site, LITA has drawn on the expertise of individual members and subgroups of LITA to provide information and recommendations on a variety of subjects.

In addition to the resources available on the main LITA website, the library and information technology community continually benefits from virtual activities of LITA members. Most conference activities are actively blogged and tweeted by participants, not only creating a record of the activity, but a forum in which those not in attendance can be updated and participate in topical discussions.

LITA has sponsored one or two LITA members almost every year to participate in ALA Emerging Leaders program. The Emerging Leaders program is designed to develop the next generation of library leaders from across the country to participate in problem-solving workgroups, network with peers, gain an inside look into ALA structure, and have an opportunity to serve the profession in a leadership capacity. By sponsoring ALA Emerging Leaders, LITA has an opportunity to help create new leaders while benefiting from the participation of that new leader in the work of the division. Projects are approved by the Board and have focused on service to LITA through creating documentation, workflows, orientation materials, and new programs, as well as providing recommendations on branding, collaborations, and web tools. These emerging leaders have been instrumental to moving forward new ideas and needed change within the organization, and continuing to support this valuable initiative has been a priority of the LITA Board since the programs' inception in 2007.

OUTREACH

LITA's outreach objective is aimed at "a broad membership, new professionals, systems librarians, library administrators, and vendors." Of course, many of the projects mentioned above are also efforts to reach out. In addition, LITA works closely with ALA's Office for Information Technology Policy and is a member of other related organizations, such as the Coalition for Networked Information and EDUCAUSE.

LITA is also involved with the creation, promotion, and endorsement of newly developed standards and maintains a close working relationship with the National Information Standards Organization. New initiatives aimed at more technical audiences, such as Code4Lib, and administered by groups such as the Digital Library Federation also include the participation of many LITA members and volunteers.

FUTURE DIRECTIONS

LITA will continue other efforts to make use of electronic communication practices, social software use, and online education and publication to support organization activities. “Virtual membership” and participation on committees continue to increase, and many groups within LITA conduct business between meetings via virtual methods. LITA’s web presence—website, blog, ALA Connect, and social media channels—will continue to be the home of new educational efforts and useful material for LITA members. LITA is also an eager partner with ALA in its efforts to improve virtual membership and participation, including online communities, e-commerce functions, and social networking. LITA will also continue to partner with ALA in finding solutions to technology challenges such as net neutrality, E-Rate, broadband, copyright, and open access to digital content.

Moving forward with the development of a new strategic direction under the leadership of president Thomas

Dowling (2015–2016), LITA will continue its theme of educating, serving, and advocating, even if the tactics in doing so change. Continued recruitment to the division of nonlibrarians, other divisional members, and professionals new to the field will be vital in moving forward. LITA is a division whose direction comes from its leaders and staff, but whose strength comes from its volunteer membership.

Library Anxiety

Diane Mizrahi

University Libraries, University of California–Los Angeles, Los Angeles, California, U.S.A.

Abstract

Library anxiety is the negative, overwhelming feelings and emotions often experienced when needing to use a library that was first studied by Constance Mellon in 1986. She identified four sources for the students' anxieties: 1) the relative size of the library; 2) not knowing where resources were located; 3) not knowing how to begin library research; and 4) not knowing how to proceed with library research. Earlier studies had begun to investigate library interactions from the users' viewpoint, and the widespread recognition of Mellon's findings invigorated further exploration of this particular phenomenon. The development of the Library Anxiety Scale enabled quantitative measurements among large groups of students in the United States and abroad. Researchers using the LAS found five factors of library anxiety and identified characteristics and antecedents most closely associated with this occurrence. Knowing which groups of users are most at risk and developing the most appropriate approaches for intervention and alleviation are important steps to efficient library service to all.

INTRODUCTION

"A former Olympic silver medalist, known to be fearless in her sport, was a college student in a library session I taught. Afterwards she confided to me, 'I really recognized myself when you spoke of library anxiety. I've always been scared of libraries.' She was unafraid to perform in front of the whole world but afraid of libraries, a perfect illustration of how fear can be an individual and very personal construct." (Personal experience of the author, January 2014.)

Library anxiety is the feeling of being overwhelmed, intimidated, nervous, uncertain, or confused when using or contemplating use of the library and its resources to satisfy an information need. It is a state-based anxiety that can result in misconceptions or misapplications of library resources, procrastination, and avoidance of library tasks. Public service librarians have long noticed this type of behavior, and pioneering studies of the reference interview process and users' perceptions of libraries and librarians provided impetus for theoretical development. In 1986, Constance Mellon published her seminal study in which she compared her own analysis to similarities found in the education and psychology fields on math and test anxiety, and coined the term "library anxiety." Librarians and researchers were quick to recognize it as a distinct phenomenon of library user behavior.

Development of the Library Anxiety Scale (LAS) by Sharon Bostick in 1992 enabled researchers to measure this phenomenon quantitatively and explore the factors and characteristics of library anxiety among a broad population. It was discovered that library anxiety and its debilitating effects are found among all levels of undergraduates, graduates, and doctoral students, as well as among students

in different countries. Some researchers have looked at library anxiety within the context of the information seeking process (ISP) and its respective cognitive and emotional aspects as defined by Carol Kuhlthau in her ISP model. Since the publication of Mellon's grounded theory, a knowledge base for understanding the characteristics of those affected by library anxiety, and its factors, antecedents, and outcomes has been developed, but there still remain many questions and areas for further research and exploration.

HISTORY AND THEORETICAL BASIS

Historically, the research of public service librarianship focused on measurements of system interactions, circulation statistics, patron demographics, and policy developments without much investigation into library user experiences. By the late 1960s, theoreticians began calling for librarians to think about services from their users' perspective. Issues raised for consideration included patron's cognitive state when thinking about an information need, the question-negotiation process of the reference interview, causes of user frustration when seeking information, and why patrons might decide not to seek assistance at all. A greater emphasis on communication and interpersonal skills training for librarians and attention to the social dynamics of the user community were suggested in order to increase understanding and lessen both librarian and user frustration. Many factors later recognized as components of library anxiety surfaced in pioneering studies of the 1970s. These included the perception of librarians as being preoccupied or rude, and patron reluctance to ask for help for fear of ridicule by librarians. One study

found that 65% of the students would not ask a librarian for assistance with their specific need because they did not want to disturb the librarian, felt their questions were too basic, or had experienced dissatisfaction with a previous librarian interaction.^[1] Such findings help explain the conclusion of another study that up to half of all patrons leave the library without obtaining the book they are seeking.^[2] Yet researchers continued to decry the significant lack of user studies among the literature, particularly behavioral research into how people interact with information and libraries. By the early 1980s, information increased in complexity and availability, and became more crucial in people's everyday lives. Libraries were employing new automated and computerized systems and patrons were faced with the challenges of learning to cope in this rapidly changing environment. New theories and methodologies were needed to research how people react with information, which was obviously more complicated than just "getting it" or "having it."^[3]

Brenda Dervin and Michael Nilan reviewed the literature on research of information needs and uses from 1978 to 1986 and note a subtle but noticeable change in the epistemological approaches of library and information researchers. They perceive a gradual shift to the inclusion of more varieties of measurements and methods; from the strictly traditional scientific approach that measures user interaction with information through quantitative means, to more alternative approaches that recognize information as constructed by humans whose behavior can and should be measured through qualitative as well as quantitative methods. Calling this shift a "quantum and conceptual leap" in the field, they encouraged more researchers to take up their challenge to invent "new ways of looking at users and linking systems to them."^[4]

MELLON'S GROUNDED THEORY OF LIBRARY ANXIETY

Like many public service librarians, Constance Mellon had long noticed the anxieties and hesitations many students displayed when using the library. She felt a more efficient library instruction program would help alleviate the problem, but had to convince skeptic faculty and administration of the need. For 2 years, she analyzed the journals of over 6000 first-year English composition students in which they recorded their process and emotions as they conducted research for their term papers. Entries from these journals were analyzed using the constant comparative method by which recurrent themes were discovered. Mellon found that 75%–85% of her student participants described their initial library encounters in terms of anxiety and fear.

Terms like *scary*, *overpowering*, *lost*, *helpless*, *overwhelming*, *confused*, and *fear of the unknown* were used

repeatedly by the students. She noticed a striking similarity to research in math and test anxieties, and felt that this new phenomena should also be considered within the anxiety framework. Mellon called her grounded theory "library anxiety."^[5]

Mellon identified four sources for the students' anxieties: 1) the relative size of the library; 2) not knowing where resources were located; 3) not knowing how to begin library research; and 4) not knowing how to proceed with library research. Embarrassment over their lack of competence drove their anxieties deeper; it seemed that all the other students knew what to do in the library and only they did not. They felt their lack of library skills was shameful and were afraid to reveal their inadequacies, or "look dumb," by asking a librarian for assistance. She states that students became so overwhelmed and "anxious about having to gather information in a library for their research paper that they are unable to approach the problem logically or effectively."^[6]

Professionals in library and academic fields have successfully used libraries for many years and may not remember or realize how intimidating the institution can be for many people. Mellon stresses that librarians and educators must acknowledge library anxiety as a common, legitimate phenomenon, and create encouraging and successful experiences for the students in order to alleviate the anxiety. She notes that students' anxieties lessened after encounters with professional librarians and encourages more personal contact between librarians and students to help them see the library as truly relevant to their academic needs with friendly and helpful professionals to assist them.^[5]

THE ISP

Two years after the publication of Mellon's seminal study, Carol Kuhlthau began publishing results of her groundbreaking investigations into the emotional aspects of research. The two studies do not indicate any influence of one on the other, but similar methodologies were used and parallel results were found. Kuhlthau based her epistemology primarily upon ideas of personal construct theory. She developed a model of six stages of the ISP and describes the emotions, thoughts, tasks, and actions typical of each. Kuhlthau identified stages 3 and 4 of the ISP, exploration and formulation, as critical from the seekers' emotional perspective. She found the exploration stage, when seekers are looking for general information about their topic in order to broaden their own understandings and construct new knowledge into their already existing knowledge, as fraught with increasing feelings of doubt, uncertainty, and confusion. The users often become discouraged and, especially at this stage, their sense of inadequacy may be so heightened that they abandon their task altogether. By the next stage, formulation, the users have

succeeded in breaking through the threatening doubts of their earlier explorations and managed to focus their topic and the information they retrieve.^[7] These anxious feelings found in the ISP, especially at the information exploration stage, strengthen Mellon's findings of the highly emotional experiences of many students when conducting library research.

Librarians had long observed behaviors of library anxiety and knew anecdotally that it existed, but no one before Mellon had so precisely studied and labeled it. Recognition of Mellon's theory generated numerous discussions and studies of the influence of library user behavior, library graphics, bibliographic instruction, and the ISP on library anxiety. By 1992, a reliable instrument was developed to measure library anxiety quantitatively.

BOSTICK'S LIBRARY ANXIETY SCALE

Influenced by Mellon's research identifying library anxiety, Sharon Bostick developed the LAS in order to discover whether the phenomena could be measured quantitatively. It is a questionnaire consisting of 43 Likert-type statements relying on self-reporting by the participants and tested an internal consistency of 0.80 using Cronbach's alpha coefficient. Through her study, Bostick identified five dimensions of library anxiety:

1. *Barriers with the staff*: Feelings by students that the librarians and library staff were preoccupied or unapproachable for assistance
2. *Affective barriers*: The "not knowing what to do in the library" situation first identified by Mellon
3. *Comfort with the library*: The physical comfort level students felt in the library building
4. *Knowledge of the library*: Knowing where things are located and how to find their way around in the building
5. *Mechanical barriers*: The perceived reliability and ease of using the library's printers, photocopiers, computers, etc.^[8]

In subsequent studies, reliability measures of the complete LAS have been as high as Cronbach's alpha 0.92,^[9] and independent measurements of each of the five dimensions all confirm the scale's reliability. Since the advent of more online, electronic and offsite library resources and services, there have been calls and attempts to modify the LAS to better reflect this new environment. The Multidimensional Library Anxiety Scale (MLAS) integrates online research attitudes and the principles of Kuhlthau's ISP into the original LAS, specifically for measuring library anxiety and perceptions among doctoral students.^[10] Most subsequent quantitative studies use the LAS, MLAS, or modified versions of either.

JIAO AND ONWUEGBUZIE QUANTITATIVE STUDIES

Through their prolific studies using the LAS, Anthony J. Onwuegbuzie and Qun G. Jiao have identified many of the characteristics and situations of students most at risk for library anxiety; demographic patterns, learning preferences, personality traits, study habits and behavioral characteristics most closely associated with library anxiety; and the relationship between social interdependence and library anxiety. Participants in their studies include undergraduates, graduate and doctoral students, and results indicate that library anxiety is found among all segments of these populations—it is not a phenomenon limited to first-year students and novice researchers. Jiao and Onwuegbuzie conducted much of their research by surveying large groups of students using the LAS and one or more other instruments that measure behavioral or demographic characteristics. They were thus able to identify major factors associated with each of Bostick's five dimensions of library anxiety as well factors relating to library anxiety in general.^[11]

Major factors associated with high levels of library anxiety include

- A non-English native language
- Working full- or part-time while studying
- Not being a frequent visitor to the library
- Being a high achiever
- Displaying high levels of perfectionism
- Not receiving library instruction
- Negative self-perception in scholastic competence, intellectual ability, creativity, and social acceptance
- Low cooperative attitudes in group tasks
- Poor study habits

Another important finding is that library anxiety is a state-based anxiety, an independent phenomenon from trait anxiety, meaning that being affected by library anxiety does not necessarily indicate having a high-anxiety personality.

Onwuegbuzie, Jiao, and Bostick gathered findings from several studies into three categories of antecedents that interact to determine the overall level of library anxiety:

- Dispositional—particular personality traits
- Situational—the environment of the particular stimulus
- Environmental—the demographic factors

This is illustrated in their model of conceptualization of antecedents of library anxiety in Fig. 1.^[12]

INTERNATIONAL STUDENTS IN US INSTITUTIONS

Studies involving international students in American universities consistently show their levels of library anxiety to be much higher than their American peers. International

Fig. 1 Conceptualization of antecedents of library anxiety.

students visit the library more frequently and are more likely to participate in library instruction sessions than American students, so their anxiety is not related to those factors nor do they result in avoidance behavior. But there are many cultural differences, communication barriers, and challenges using English-language resources and search strategies with which these students must cope in their new environment. They often arrive with erroneous beliefs about the functions of American academic libraries such as the purposes for using the library and types of services offered, which may be very different from what they are used to in their home countries. Multiple sessions of information literacy instruction were shown to help alleviate library anxiety in one study.^[13] But while there are many studies of international students' library behavior, only a few focus on library anxiety among this population. More research is needed to further identify the specific antecedents and develop mechanisms to help alleviate their anxieties.^[14]

INTERNATIONAL STUDIES

Academic libraries worldwide vary greatly in their organization, cultures, philosophies, function within their institutions, user expectations, and interaction styles with their patrons. Until the early 2000s, nearly all studies of library anxiety were performed in American universities and institutions. Based on the research of Mellon, Bostick, Jiao,

Onwuegbuzie and others, researchers began exploring library anxiety outside of the United States, and results indicate that it is indeed an international phenomenon. Studies performed in England, Israel, Kuwait, Malaysia, Sudan, Canada, Poland, and China^[15–22] show that while cultural differences do exist, students worldwide are affected by similar anxieties when using their academic libraries. Researchers used translations and modifications of Bostick's LAS in order to better reflect local culture. Analysis in each study produced slightly different factor groupings than the American studies, and the findings suggest that although library anxiety may be an international phenomenon, cultural context must always be considered when studying and measuring it.

INTERVENTIONS

Libraries engage in many proactive strategies to help educate their users and bring in new ones. They may not consciously be seeking specific mechanisms for reducing library anxiety, but with enough careful thought and planning, each individual effort can make a difference. Onwuegbuzie, Jiao, and Bostick categorize procedures into three types of approaches: library facilities and resources management, library instruction, and mediated informational services. Within each category, they place specific intervention strategies that address the various dimensions of library anxiety.^[23]

Library facilities and resources: This category includes all the strategies that librarians and library managers employ to make their facility and resources as user friendly and welcoming as possible, ensuring a pleasant atmosphere within the physical compound that will encourage the patron to return often and without hesitation. It directly addresses the third factor of library anxiety identified by Bostick, “comfort with the library,” and can help alleviate Bostick’s fourth factor, “knowledge of the library,” and the fifth, “mechanical barriers.” Strategies in this category include effective library signage and graphics, logical space and furniture arrangements, library tours, in-library computing labs, laptop stations and wireless availability, laptop lending, small group workrooms, coffee bars and snack areas, efficient document delivery systems, and fully functioning library consortia.

Even in this age of electronic library collections that enable users the convenience of accessing many resources and materials online, students still value the library building as a learning and study space. Outreach efforts to bring them into the library and help them become comfortable with staff and the facilities often include methods not formally associated with academic libraries. Toward the end of the term and during final exams for example, many libraries offer extended hours as well as free healthy snacks and other study-break treats known as stress busters—therapy dogs, free massages, origami and crafts corners, meditation, etc. Throughout the academic year, libraries also hold events including concerts, dances, poetry readings, contests, displays of student research, and exhibits targeted to student interest, all designed to raise library awareness, interest, and comfort levels.^[24–26]

Library instruction: This category includes all types of information literacy instruction—teaching users how to identify an information need, locate, evaluate, and use information effectively and ethically. It directly addresses the cognitive obstructions that Bostick termed “affective barriers.” Most instructional strategies, however, involve professional library staff, and this librarian/patron interaction can also help alleviate Bostick’s first factor, “barriers with staff.” Academic libraries today see instruction as one of their primary tasks, and they perform this through numerous ways such as classroom instruction; online tutorials; drop-in workshops; print and online help guides, and through multimedia technologies such as television broadcasts, webcasts, streaming video, and podcasts. Targeted outreach and marketing campaigns to raise student awareness of library resources and services, “putting a familiar face with the place,” are also being used. Studies on the impact of bibliographic instruction on library anxiety show that in-person instruction can significantly reduce library anxiety among college students.^[27–29]

Mediated informational services: This category includes the traditional reference services such as mediated reference assistance at the reference or information desk, active reference roving, and individualized information consultation,

but also includes chat reference services, reference through instant messaging, email, and online social network services.^[30] Successful interactions with staff will help alleviate the “barriers with staff” factor, but depending on the content of reference or information query, the interaction may help dissipate any of Bostick’s five factors.

The best strategies and procedures are secondary, of course, to a friendly, patient, welcoming, and effective library staff. The most efficient services and instruction devoid of any warmth solidifies preconceived perceptions of the rude and uncaring librarian and an intimidating institution.^[31]

CONCLUSION

“Of all forms of academic-related anxiety, library anxiety appears to be the most common.”^[32] When Constance Mellon published her breakthrough study in which she systematically identified library anxiety two decades ago, practicing librarians finally had a name for the behavioral phenomenon they had observed for years. The library environment has experienced rapid change during this time, but the hesitations, inhibitions, confusion, and lack of self-confidence students often display when using or contemplating use of the library for an academic need are still in evidence. Various epistemological approaches and theories have been used to explore and explain this area of library and information user behavior. Through the use of Bostick’s LAS and other research methods, library anxiety has been studied quantitatively among large heterogeneous groups of students, and prominent characteristics and antecedents of students most at risk for library anxiety have been identified. Studies of international students in American universities and research conducted outside the United States indicate that while cultural variations exist library anxiety is a global phenomenon.

Research of college students in academic libraries dominates the literature. Library anxiety among other populations, including people with disabilities, who are homeless, have immigrant status, or are elderly, and among other institutions such as public and school library users still need to be explored. In an age demanding information literate citizens, library anxiety research and understanding can be integrated into current information literacy initiatives and help shape information policy decisions.

Library Architecture and Design

Charlene S. Hurt

University Library, Georgia State University, Atlanta, Georgia, U.S.A.

Thomas L. Findley

Leo A. Daly/Architects & Engineers, Omaha, Nebraska, U.S.A.

Abstract

A survey of the evolution of library architecture and interior design during the latter half of the twentieth and early twenty-first centuries focuses on the change from libraries primarily designed to hold paper collections, sometimes used only in the library, to libraries primarily designed to provide access to technology, digitally stored information, and research and learning spaces. The societal changes that led to the growing role of libraries as places for building community, collaborating, and engaging in independent learning are also discussed. The major components of the design process for libraries are discussed, and the design impacts on the core areas of the library are described.

The past several decades have brought about radical changes in all types of library buildings, driven primarily by technical and cultural/societal changes. Libraries have been changing over the centuries as the formats for inscribing and preserving the written record of human history have changed, and as the concept of public libraries developed alongside the earlier concept of private libraries. Seen from that perspective, the evolution of library design in the twentieth and early twenty-first century does not seem revolutionary, although the speed with which it has taken place may be unprecedented. The changes are the result of several factors: changes in the format of materials, changes in the audience for libraries, and changes in the role libraries play in the community at large.

The current transition is driven by the increasing dominance of various means of electronic storage of materials, the demand for easily accessible computers for library patrons, and a declining emphasis on physical collections as the primary purpose for the library building. The changes are deeper than that, however, and respond to a range of developments in the social and economic environment that would have required adjustment under any circumstances. It may well be that the advent of the digital age, contrary to the early fears that it would destroy the library, actually saved libraries from having to choose between their missions to store the world's knowledge and their need to provide their supportive communities with the services they demand.

IMPACT OF TECHNOLOGY

Design of library buildings during the nineteenth and much of the twentieth century tended to focus on the need to hold the growing physical collections that resulted from

the mass production of books and periodicals. A thorough discussion of this type of library architecture can be found in Schell's "Buildings, Library," in the 1970 edition (volume 3) of *Encyclopedia of Library and Information Sciences*.^[1] Beginning with the post-World War II era, that classic design, often referred to as the Carnegie rectangle, was challenged by the increased presence of various types of technology, each creating their own demands: microfilm, with its need for darkened space for viewing; various forms of media, each needing appropriate equipment to use; and copy machines, requiring spaces to store paper and handle financial transactions. Computers, which first appeared in the workrooms of libraries as tools for managing the paper resources, moved out to the public areas of the library, beginning with online catalogs, and the computers became sources of information for library staff and patrons. This change has escalated rapidly, requiring libraries to bring electrical and network connections to large public spaces, and putting pressure on spaces designed to hold stacks and readers that frequently had minimal power and network connections available. Meanwhile, the paper collections continued to grow, and in many libraries traditional reader space was sacrificed to make room for collection growth.

The changes required by technology had an impact on all types of libraries, but in many ways, the smaller public and school libraries were initially better able to adjust, not being burdened by the need for comprehensive archival collections. Many had moved toward providing more media equipment for patron use and encouraging more active patron engagement in various programs. The school libraries that became part of elementary and secondary school design were often viewed as teaching libraries, and frequently served as media centers. Public libraries built smaller branch libraries closer to their users than the

larger central libraries, and responded to the popularity of their children's collections and the growing demands of young adult patrons with specially designed spaces more suited to housing children's and young adults' books, media, and computer equipment. These newer buildings were more likely to incorporate better power and network connectivity in their design, although the breadth of need was not at first anticipated.

The growth of public computer installations in research libraries, both public and academic, continued alongside the growth of their collections, leading library planners to face decisions about how to develop new, flexible, highly wired space in buildings poorly suited to that purpose. For librarians, the choice sometimes seemed to be between their collections and the needs of their changing mission. The solutions varied according to the availability of other space, the resources of the libraries, and their missions. A variety of solutions developed, including the development of separate undergraduate libraries, much less focused on archival collections and often located in the older original libraries, allowing the large collections and technologically demanding resources to move to new facilities. Another trend has been the development of storage facilities for the less-heavily used collections, sometimes serving multiple institutions, such as the Washington Research Library Consortium's storage facility in the DC area. One technology that helped libraries with collection growth was the development of compact shelving for less-heavily used collections, which began in Europe and Japan before moving to the United States in the 1960s.^[2] These movable stacks can compress collections into approximately one half of the space otherwise needed, but installation of compact shelving into many extant library buildings is impractical because of the need for heavy load-bearing floors.

The recent development of radio frequency identification technology for tagging books has enhanced the possibilities of storage of collections, including the use of robotized facilities, such as the stacks in the University of Nevada Las Vegas Library, where the automated book retrieval system is across from the Circulation Desk and can be viewed through a large glass window (see Fig. 1).

IMPACT OF CULTURAL CHANGES

Changes in the culture have also created new demands on libraries. The growth of the free public library and the impetus given to that by the large-scale construction of Carnegie libraries in the early twentieth century initiated those changes as the size and diversity of the population expecting access to libraries and the resources they provide began to grow. In the past 15 years, public libraries, often with significant support from foundations such as the Bill and Melinda Gates Foundation, have become primary

vehicles for providing public access to computing for those who do not have such access readily available. Libraries serving large immigrant populations have also begun providing books, periodicals, and services in languages frequently used in their service area, which creates new collections and service space requirements. For academic libraries, there has been a rapid growth in the student population and, in recent years, an increasing emphasis on international studies, resources, and students. Libraries which previously collected only in English are called upon to collect materials in other languages, and provide access to them. Changes in the methods of instruction have had a significant impact on what kinds of library space students desire, as the use of online courses and supplemental materials grew and the emphasis on group projects expanded.

An extremely important aspect of cultural change that is driving the evolution of library architecture is the

emergence of the library as a place for community. This is most pronounced in public libraries, where library as a meeting place for various community groups and as a provider of information-related and special population programming has taken on a very important role. Public libraries devote considerable space and staff to serving children, usually in specially furnished areas designed to attract children and their parents (see Fig. 2), and to areas designed to appeal to their young adult users, often needing a place to study, do research, and be with friends in a safe space when not in school. In many ways, this population is much like the academic population of users in academic libraries.

The role of libraries as spaces for community is an increasing focus on academic campuses, where the end of the “quiet study only” library and the emergence of the library coffee shop have created a sense of the library as the place for “academic community,” as opposed to the social community spaces in student centers or the recreational community spaces in gyms and recreation facilities. Since the Leavey Library opened at the University of Southern California in 1994, there has been a trend to build Information Commons or Learning Commons, each designed slightly differently but all having in common very large, technologically intensive space which seeks to meet the student need for computers and assistance in using those computers and the information they deliver in highly visible and social space.

Many students prefer to work in very public spaces, and want to be within view of someone who can help them, and they will congregate in heavily traveled areas

where they can see and be seen. The degree to which these common areas include such things as paper collections, lounging areas, group study areas, and specialized technology environments varies from library to library, and the ultimate evolution of these spaces remains to be seen.

University campuses still may contain specialized libraries that are often quite different from the central library, although the effects of technology and differing expectations of students have similarly affected their design. The most common examples are law school libraries and music libraries.

A growing trend is to build multipurpose facilities that house more than the library. For many public libraries, this consists of a cluster of community spaces, including recreational space, municipal offices, performance space, and the public library. Examples include the Asker Public Library outside of Oslo, Norway, which combines an art gallery, theater, and restaurant, and the Largo Public Library in the heart of that Florida city’s Central Park. Combined public and school libraries are also popular. Combined public and university libraries are also emerging, such as the libraries of San Jose State University and the City of San Jose and the combined Royal Library, National Library of Denmark and Copenhagen University Library (see Fig. 3).

Community college libraries are often colocated with other learning facilities, such as counseling and tutoring centers, and sometimes share their buildings with various student services like registration and financial aid. Academic libraries, such as the library of the University of Otago in New Zealand, are creating spaces to share with

the Instructional Technology Divisions, with Centers for Teaching and Learning, and with various student services such as Writing Centers and English as a Second Language (ESL) tutors. Some academic libraries are linked to student unions, such as the Johnson Center at George Mason University. In all cases, the mix of facilities is driven by the local needs of the environment, and ideally by the perception of librarians as to what services students need that can be best colocated in their libraries.

Whatever the combinations, the realities of different missions, user base, collection priorities, specialty areas, and hours and services present significant challenges and call for careful planning and a great deal of diplomacy and flexibility. The rewards can be substantial, both in cost savings and better services to library users and the communities.

Libraries have always emphasized security, but until recently the biggest concern was keeping collections safe from theft. The very concept of libraries as places where all the users have equal access to the information they provide has created another security requirement: keeping the patrons of the library secure. The growth of large homeless populations has made this a particularly difficult issue in large downtown libraries, but there are few libraries that have not had to deal with this issue. Locations of service desks and computer clusters are driven by the need for visibility, and small nooks and private spaces need to be in areas where traffic regularly passes.

Other impacts on libraries and therefore their buildings have been related to equal access and services for disabled patrons, which has been both enhanced and made more complex by the many technologies available to assist them. Power wheelchairs allow increased mobility, but

their size usually exceeds that of manual wheelchairs and should be taken into consideration in sizing of aisles.

A fairly recent trend in library architecture and interior design has been the emphasis on sustainable design, also known as greening the library. Librarians and architects share an interest in using building materials that emphasize recycled and environmentally friendly components, and design focused on energy conservation and effective use of materials that will not need frequent replacement. Meeting the challenge of greater natural light and showcasing the activities within a library to passers-by without energy loss is a particular challenge, and has led to some of the more creative design solutions, such as can be seen at the Phoenix Central Library.^[3] Interior designers seek finishes and furniture that are made from recycled materials, such as old tires or seatbelts, and from renewable resources such as cork and bamboo. Construction companies are developing more environmentally friendly ways of excavating the site and reusing or disposing of materials used in the building process. Some campuses, such as Emory University in Atlanta, have committed to building all new structures and renovations using the guidelines of sustainable design. Libraries increasingly seek to be certified by the Leadership and Energy Environmental Design Green Building Rating System (LEED) at one of the four levels: certified, silver, gold, or platinum, and calls for proposals for designing and constructing their facilities where evidence of LEED-certified team members and methodology is a requirement.

The rise in popularity of coffee shops as parts of libraries began in the 1990s, and has become an expected part of almost all new or renovated academic library planning and many public libraries. This trend arose as librarians realized the futility of keeping food and drinks entirely out of their libraries, and tried instead to contain some of the possible damage by encouraging use of covered containers, providing adequate trash facilities, and specifying certain areas where a ban on food and beverages will be enforced—often around computers. The prevalence of food and beverages in the library has particular impact on the selection of interior finishes and furniture, as they must be able to handle beverage and food stains and be easily cleaned. Provision for waste disposal and recycling also needs to be made.^[4]

MAJOR COMPONENTS OF THE DESIGN PROCESS

The architecture of the modern library is clearly evolving from the old Carnegie boxes of earlier centuries, and we see in recent library design a number of solutions to the changes outlined above. The keys to successful library planning in the twenty-first century are careful analysis of the needs of the population to be served and their expectations, a building program that is informed by an awareness

of future trends and how they might impact on the building being designed, recognition that one cannot anticipate everything that the library will become, a firm commitment to flexibility of space and furnishings, and deep library staff involvement in the planning process. These qualities will be seen in each aspect of the final design, and take specific form in each aspect of the plan.

The Master Planning Process

Involvement of librarians in the architectural decisions of library buildings needs to begin early and continue throughout the process, culminating in the occupation of the new space. Often that planning process begins with a survey of the user community to determine their interests and needs. Under ideal circumstances, the library building is part of a master plan for related spaces around it, which recognizes the need for common traffic control, security, and parking facilities. For large libraries or library systems, there is often a master plan that considers their overall development, and anticipates changes in spaces of buildings that are not part of the original plan.

Developing the Building Program

The core document in a library's design process is the library building program. This may be developed by the library in conjunction with planning consultants or the architectural design team, or both. A well-prepared library staff begins preparation long before this process with internal discussions of what the library needs, where the library anticipates change, and what the library staff dreams of in their new facility. Imaging the future sessions are often used during this process.

The programmers will work closely with staff, asking them to describe their current space and think about how they would like their new space to work. Careful attention is given to adjacencies, which areas need to be next to which, importance of public access, and special furnishing, equipment, and security needs. This document is often described as the bible for what comes afterward, and it is essential that the final document is thorough and looks toward the future.

Consulting with External Experts

External experts are often employed to bring their perspectives and knowledge to the project. Most commonly consulted are library building consultants, structural engineers (often part of the design team), Audio-Visual (AV)/Media Specialists, Acoustical Consultants, Security Consultants, Library Move Management Consultants, and Way-finding/Signage Consultants. The need for each of these varies with the library under design.

One specialized area of knowledge that cannot be neglected is knowledge of the building regulations related

to access and safety. These tend to vary by geographic location, and failure to plan for them can be very expensive. In addition to the usual requirements for power, plumbing, and structural integrity, there are regulations related to emergency egress and disabled access.

Impact of Library Architecture on the Community

Although the usability of the building on the inside is the primary consideration, planners need to recognize and be sensitive to the importance of the appearance of the library in its environment. It is not uncommon for the library to be one of the largest buildings in the area, and a beautifully designed library can enhance the area around it, make a statement about the organization to which it belongs, provide a centerpiece for a larger cluster of buildings, and serve as a beacon to the community. Dramatic public libraries like the main library in Salt Lake City and the recently opened Seattle Public Library become destinations and objects of pride for the cities. On a smaller scale, public libraries seek to reflect their communities, such as the Spanish Spring Library in Nevada with its Native American design and interior treatments-based images in the nearby environment.

Aesthetics, Display Space, and Signs

Geoff Freeman, architect for many innovative library buildings, has talked about the increased expectations for "immeasurables that only a library can provide." These include how the spaces feel, "how they attract, and how they stimulate and inspire as well as give pause for reflection and focus." These immeasurables are considerations in all stages of the library's design, and are key to the interior design.^[5] Good interior design will have a significant impact on the library's aesthetics and will impact the behavior, use, and security of library buildings. Library patrons will welcome opportunities to offer their opinions on the types of furniture that are used and the color palates that are chosen. It has become common to ask furniture companies to provide sample furniture that can demonstrate how well it holds up to use and gives patrons opportunities to comment on comfort and "look and feel." This can help create excitement about the new space, and assure the planners that they have correctly interpreted their patrons' needs.

The important consideration of traffic flow can be much enhanced by use of appropriate finishes that help identify and guide patrons through the various spaces of the library. Good signage is also essential, and use of technological methods for delivering information, such as video and computer screens, is becoming common.

In addition to the buildings and furnishings, libraries often have important display space and large empty walls inviting installation of art. The selection and purchase of art for libraries has the potential to develop good

partnerships with art departments and the local arts community, and possibly attract financial support. There are also the practical aspects of design, such as budgeting for, and coordinating, receptacles for recycling and trash during the overall building design.

Construction

Newer methods of design and construction of buildings, such as design/build construction and guaranteed maximum price construction, have tended to blend the entire process, making it much more interactive between planners and builders. Working with such projects varies greatly from the earlier model of buildings planned and designed and then turned over to the contractors for bidding and construction. More than ever, it is essential that all members of the team remain informed, involved, and available during this process, although the involvement of librarians will lessen as the process continues, but iterative decision making continues throughout, and unexpected compromises or pleasant surprises can have a major impact on the final building.

DESIGN IMPACTS ON CORE AREAS OF LIBRARIES

This process will not result in a group of identical libraries because the strengths, expectations, and ambitions of each library vary in important ways. Nevertheless, there are specific factors that apply to the major areas of the library: public service areas; teaching, training, and meeting space; individual and group work space; collections space; specialized collections and services areas; staff space; technology support areas; and building support and security.

Public Service Areas

The increasing complexity of library resources and the concomitant education and training required by those providing assistance to library patrons have led to reorganizations of these services, a trend which continues to evolve. Factors, which impact on the architecture of the library, include a variety of solutions as to size and placement of service desks, increasing provision for small group work and individual consultation, and technologically sophisticated teaching and learning spaces. Some libraries have a variety of public service desks, often characterized by the type of assistance being given: security enforcement, general information, research assistance, technology assistance, and circulation of materials. Others have only one combined desk, and some have eliminated the traditional reference desk. The degree to which professional assistance is available at service counters varies considerably, with some libraries trending toward most professional

librarian assistance delivered in consultation rooms and offices, with service desks staffed with trained assistants who have various specializations, including technology. Some libraries are experimenting with roving assistance rather than centralized desk assistance, and self-check-out equipment is being provided for routine circulation transactions. The nature of the community of users and their service expectations need to be carefully and realistically analyzed to determine how public service areas should be designed. Desks that can be reconfigured as needs change will provide maximum flexibility.

Teaching, Training, and Meeting Space

Libraries have long recognized that there are substantial efficiencies in teaching groups of patrons rather than teaching the same thing to one patron at a time, but often lack dedicated and appropriate teaching space in which that instruction can be scheduled. There is also a growing need for training space for library staff, and spaces for offering training on various technologies to the library's patron groups. For many patrons, the first contact with a library may be through attendance at a class, training session, or public event in the library's space, and there is strong evidence to suggest that they are much more likely to return once they have seen the richness of the library's resources. Newer libraries are dedicating much more space to these functions, which is partially enabled by the lessening pressure of physical collection growth. These spaces vary according to their purposes and availability of technology, but common characteristics are provision of an installed computer base with presentation technology, multipurpose rooms that can be used with or without computers at each workstation, and attractive public meeting space for conferences, media presentations, performances, and various types of meetings. Recent improvements in wireless technology and the growing downsizing of computers make flexibility easier to achieve, and reliance on laptops, which can be installed in the furniture and made accessible on an as-needed basis, is becoming more common. The location of teaching space is ideally very visible and easily reached from outside of the library, but the large dimensions of that space and need for technology also must be considered.

Individual and Group Work Space

A substantial and outspoken group of library patrons still come to the library to find quiet spaces for reading and study. Planning in advance for areas designed to meet their needs is essential, and needs to be done in a way that does not discourage library use by patrons seeking other kinds of space. Libraries can designate specific areas for quiet study, sometimes creating special rooms for that purpose. They can also utilize furniture types and overall environments to encourage quiet, taking advantage of

stacks that can act as sound buffers, specifying more remote areas for quiet study, using sound absorbing materials such as upholstery and carpet, and providing individual study carrels with high panels on both sides. Some libraries have installed white noise technology in their buildings to lessen the impact of various sources of noise.

For many library users, especially students, the library is seen as a place to meet with groups, work together on projects, and practice presentations of their work, almost always with technology near at hand and often with whiteboards or other space for posting their work in progress. Student demands are likely to include needs for multimedia creation, collaborative computer use, digitizing equipment, color printers, and places to plug in personal electronic devices. Information and Learning Commons are usually designed with these users in mind, as are the proliferation of group study rooms and various types of media-equipped rooms (see Fig. 4). Design of these spaces will continue to evolve as technology develops; the trend toward smaller devices with more connectivity will surely impact how those spaces are configured and furnished. For maximum flexibility, careful

thought needs to be given to provision of raised floors, wiring channels, and dropped ceilings.

In general, libraries need to provide a variety of types and configurations of seating, including classic library tables and chairs, carrels of various types, computer pods, group study tables, lounge furniture, and possibly benches or booths. Patrons tend to adapt what is provided to their needs, and so furniture which can be moved and reconfigured should be considered. There is a large contingent of people who prefer working in a busy and very visible environment, preferably with lots of natural light. Taking advantage of windows and traffic patterns can help planners meet this need.

As a general rule, all of the library should be accessible to disabled patrons, but there may be a section of seating which provides various assistive technologies. Throughout the library consideration should be given to providing seating that can meet the needs of patrons with special needs.

Space for Collections

Libraries need a variety of shelving configurations for differing types of collections, including less-immediately accessible space for seldom-used materials and a mix of shelving for collections that need to be associated with equipment required to access the information they contain. Common shelving configurations include standard stacks, compact shelving units, folio stacks, reference stacks, atlases and maps, browsing materials, and media. Consideration should be given to the possibility that space now configured for a particular collection (reference, for example) may shrink, grow unexpectedly, or be relocated, or that the total amount of shelving will be reduced in order to create space for new needs.

Specialized Collections and Service Areas

Specialized collections include children's collections, media collections, maps, government documents, and archives and special collections. Each of these has unique requirements for storage and use of materials, and some of them may offer independent service points. Shelving which is appropriate for the children's collection is different from that for other book collections, and may include media storage. Seating in these areas is also unique to children's needs, as are many of the interior design features. Some of the other collections are primarily different in their shelving requirements, but media collections may be in unique space in order to meet the equipment, security, and assistance needs of those collections.

Archives and special collections have unique needs for security, service, and appearance, and are often in a space

Fig. 4 Georgia State University Learning Commons.
Source: Photograph by Visko Hatfield. Used with permission of Visko Hatfield and Leo A. Daly, Architects.

separated from the rest of the library. There is a trend toward greater visibility of these collections, as exemplified by the housing of the King's Library (King George III's collection) in a smoked glass tower at the British Library, visible from the main entrance hall and various areas of the library.^[6] As archival and special collections make increasing use of digital technologies, it is reasonable to assume that users of the digitized materials in these collections may also migrate into the common public areas, creating additional service requirements and greater demand to see the original materials from which these images are derived.

Staff Areas

Staff spaces need to be highly configurable and flexible. The nature of library work has been evolving for many years, and that evolution probably has not been completed. The trend is to a more open architecture, with fewer private offices and more readily rearranged furniture and equipment. Shared small conference rooms for consultation are often provided. Space that can be repurposed for technology and/or individual or online patron assistance may supplant space now used for the decreasing traditional physical processing of materials. Staff spaces should also allow for the highly collaborative, teamwork approach to modern library work, and for the realities of today's workforce, which may include working parents, disabled employees, and staff working a large variety of schedules. Security of staff, their personal possessions, and library equipment and supplies must be an important consideration. Absolutely essential is a pleasant staff lounge with appropriate equipment for employee use. Some libraries provide a private space for nursing mothers.

Technology Support Areas

The growth of the use of technology in all areas of the library will likely continue to expand the staffing of these areas, and the need for various kinds of equipment for such activities as digitizing collections, designing Web pages, managing online systems, equipment repair and updating, and multimedia creation and viewing. Design of that space will need to allow for intense power and network connections, careful security, specialized spaces for any equipment needing constant environmental control, and collaborative work spaces, including room for groups to work on a common screen. The exact nature of this space continues to change as the technology changes, and more compact equipment may lead to differing space and heating, ventilating, and air conditioning needs. It is particularly important that these areas are built as flexibly as possible, with easy upgrading of power and connectivity needs.

Security and Building Support Spaces

The open nature of libraries creates unique needs for security, and heavy usage provides a substantial challenge to maintaining the facility. In addition to control gates at exits, planners may control entrance to the library. Workstations open to all users may be placed in locations close to staffing and security points. Building managers and custodians need accessible and strategically placed facilities.

CONCLUSION

Fortunately for library planners, there are many prominent and innovative architects and interior designers who are interested in designing library buildings and renovation projects, including a number of firms that have groups of library specialists. Libraries are one of a small group of public buildings that still offer the challenge of creating an important space for a large community, and their design is a matter of great interest to the communities in which they are built. Libraries today are characterized by large, light-filled spaces, showcasing their contents and services and featuring welcoming facades. Often their design needs to be part of an overall master plan for the area in which they are built, and which fits with the overall architectural vocabulary. There are so many notable new library buildings that it is difficult to provide a selected list; there are numerous lists of notable library buildings, including the annual Architecture issue of *Library Journal* and the Design Issue of *American Libraries* and a wide variety of articles on new buildings in library and higher education literature, as well as in local and campus newspapers. The Web pages of libraries in the process of new or renovated buildings also provide a wealth of information. A brief list of books that are valuable resources for understanding the evolution of library architecture and the continuing requirements of library buildings appears below.

Winston Churchill said: "We shape our buildings; thereafter they shape us." At the heart of the evolution of library buildings is the evolution of library services and staff, and library planners will often discover that by the time they occupy their new space, their needs would have already changed in various ways. The familiar admonition to think outside of the box applies especially to the process of designing libraries, as does the need to recognize that the perfect library has yet to be built.

Library Architecture: History

Nan Christian Ploug Dahlkild

Royal School of Library and Information Science, Copenhagen, Denmark

Abstract

The history of library architecture goes back to the third millennium before Christ. Library architecture has been closely related to the development of library collections and their materials: from the clay tablets and papyri of temple libraries to the stately interiors of noble and royal libraries and the rationally organized stacks of the twentieth century research libraries. However, in the twentieth century and around the millennium many libraries have also developed into multipurpose or multispace cultural and public centers. Important steps in the development of the modern library have been: Gabriel Naudé's *Advice* from 1627, the library visions of the Age of Enlightenment, the open access of the public libraries, and the opening of the library space of the twentieth century. Around the millennium physical library space is challenged by "the library without walls."

There is a close connection between the development of books and media and the development of library architecture and interiors. Existing library buildings, historical libraries, and library projects can be seen as expressions of the politics of culture, knowledge, and information of different societies and historical periods from the first written documents to the digital challenges to the physical library space.

CLASSICAL, MONASTIC, AND ROYAL LIBRARIES

The history of library buildings goes back to the third millennium before Christ, where clay tablets were kept in rooms in palace compounds in Mesopotamia. In Egypt, papyrus scrolls were kept in both palace and temple libraries. In China, bamboo slips, panels of silk, and paper scrolls were stored in libraries. In Greece and Rome, the standardization of simple alphabets leads to the growth of popular literacy, and along with the democratization of the reading process public library buildings occurred. Often these public libraries were constructed as parts of public meeting places in the communities such as public baths, stoas, forums, and basilicas. In the third century after Christ the codex form increasingly came into use. Examples of library buildings from this period are the great library in Alexandria, the library in Ephesus in The Middle East, and the library in Timgad in North Africa. The Trajan's Forum with Bibliotheca Ulpia was built as a twin library with colonnade facades around the Trajan Column, which could in itself be read as a library document. Here the library was connected to a coherent urban space.

In the middle ages libraries were related to monasteries and cathedrals. There was a close connection between the writing of documents in a scriptorium and the collection of

documents in an armarium. In the ideal plan for the abbey of St. Gall from c. 820 there was a two-storeyed library building with a scriptorium below and a library above. Often the reading took place in stalls with chained books. Still existing libraries of this type are the Corpus Christi College in Oxford and The Hereford Cathedral Library. A more spacious example is the Bibliotheca Maletestiana in the city of Cesena in Northern Italy with lecterns in a row from 1452. Universities and university libraries were established in the thirteenth century along with the growth of commerce and towns and the beginning secularization of knowledge. At the University Library in Leiden (Fig. 1) readers were placed at lecterns with chained books that were divided into seven sciences: theology, literature, philosophy, mathematics, law, medicine, and history.

Typically collections from the Renaissance period included books, art, antiquities, religious relics, and objects of geology and natural history. Often these early encyclopedic collections with various categories had the character of a Cabinet of curiosities or Wunderkammer. The arrangement of objects could also be defined as a memory theater. Later collections were divided into more specialized archives, libraries, and different kinds of museums.

The art of printing gradually changed the amount of documents from the fifteenth century and influenced the selling, collecting, and lending of books. A few libraries were opened to the public, and the chaining of books became more seldom. The first comprehensive theory of library organization was formulated in 1627 by the Renaissance physician and librarian Gabriel Naudé in his *Advice* from 1627. Naudé was the librarian of the French Cardinal Mazarin and created his library. His theory was characterized by Renaissance humanism, emphasizing thorough and comprehensive studies. It presented all-round guidelines not only for arranging library collections,

Fig. 1 The University Library in Leiden in 1610 with chained books, divided into seven sciences.
Source: Carlssons.

but also for furnishing and equipping library premises and making them accessible to the public. He introduced modern principles such as open access, representing opposite viewpoints in the collection and professional order. He recommended a practical design of the library and preferred a quiet location, possibly near a beautiful garden. He praised contemporary libraries of Sir Thomas Bodley in Oxford, of Cardinal Borromeo in Milano and the Augustin brothers in Rome for their open access. The library of the Medici in Florence was “beautiful and admirable.”

The long hall of the Medici Library, designed by Michelangelo 1523–1571, was a Renaissance library with rows of lecterns, flanking the central aisle. The architectural experience was shaped by the steady rhythm of corresponding lecterns and windows. The books were stored permanently at the lecterns. Therefore the reader had to move from one lectern to another to read different books. Another important Renaissance library of the same type was the Sansovino Library in Venice with its impressive façade at Piazza San Marco. The library building was begun by Sansovino in 1536 and completed in 1591 by Scamozzi.

The hall or Saal library developed together with the Baroque and Rococo styles in the seventeenth and eighteenth centuries in monastic, noble and royal libraries, with their stately interiors and distinguished collections. In these libraries both the collection and the interior served representative purposes of the owner or patron. Books were typically stored in shelves along the walls, impressing the viewer with the extent of the collection. Fine examples are the Hofbibliothek from 1726 in Vienna with its huge Prunksaal at the size of a cathedral with Baroque frescoes, showing Glory with a pyramid in the middle, the Monastic Library of Wiblingen in Germany from 1757 with its symbolic sculptures, and the

Benedictine Abbey Library at Admont in Austria with its collection and interior in white and gold. Experimental geometrical forms have the Wolfenbüttel Library from 1710 and the Radcliffe Camera in Oxford from 1749. The Herzogin Anna Amalia Library from 1766 in Weimar is interesting because of its almost oval library within the library.

Also in the oriental tradition, libraries represented places of learning and contemplation. The contemporary Tinayi Ge Library in China, built 1561–1566 by minister of the Ming dynasty Fan Quin, was placed in a garden with a small pool, connected to a lake, not only for recreation, but also to avoid fire. The building around a small yard has double eaves and gable roofs. The library was divided into six parts, corresponding to the idea, that the earth was formed in six parts. The collection of books had labels such as Gentle, Respectful, Modest, Sun, Moon, Time, Dragon and characters, referring to Chinese music.

THE ENLIGHTENMENT AND THE GRAND LIBRARY DESIGN

In the age of the enlightenment a new notion of public libraries arose against the background of an expanding readership and a growth in the number of published books and scientific, literary, and political journals. The ideas of the enlightenment were expressed in a series of grand utopian projects. The French enlightenment architect Étienne-Louis Boullée envisaged a universal library in a grand design in 1784. Boullée’s library project was called the *Bibliothèque du Roi* (Fig. 2). Before the French revolution the king and the state were so closely intertwined that one could interpret the *Bibliothèque du Roi* as an institution in which the state began to assume responsibility for providing books to the people. Like the French

Fig. 2 Étienne-Louis Boullée's utopian library project from around 1780.

encyclopedia it should gather, order, and disseminate all available knowledge. Boullée's revolutionary library project was a manifesto for the kind of building that would promote access to knowledge and educated thinking—the prerequisites for an enlightened and critical public discourse. It acquired significance as the model for a series of grand library buildings of the nineteenth century, and gave libraries and other cultural institutions a new, hitherto undreamt centrality in the urban landscape.

At the same time educational parks were established such as the Woerlitz Park at Dessau in Germany with both examples of agricultural cultivating methods and a small library building with agricultural and horticultural literature. Visitors could bring the library's books with them to the park, both enjoying and being educated by the surroundings. In Beverwijk in the Netherlands, the female writer Bethje Wolff built a small hut with a library in her garden (Fig. 3). This decentralization of the dissemination

of knowledge was possible because of the easier access and transportation of smaller books.

The library visions of Étienne-Louis Boullée inspired the grand library design of the nineteenth century.

In 1850 Henry Labrouste finished his *Bibliothèque St. Genevieve* in Paris. He conceived the building as a monument over the history of civilization and knowledge. The exterior was covered with plates, showing inscriptions of names of 810 names of international authors, philosophers, and scientists from Moses to the Swedish chemist Berzelius in chronological order, almost like a catalog in stones. Thus the building itself became a document, a book. The interior of the building had iron columns and decorative iron arches over the vast reading room one story above ground level. In 1875 Labrouste finished a new building for the *Bibliothèque Nationale*. In the reading room, 16 iron columns carried 9 domes of faience and glass. Murals were painted with wooden motives with blue skies. In Copenhagen, J.D. Herholdt designed a new University Library in 1855–1861 with elegantly slim iron columns and a tunnel vault, painted in pastel colors. Fine examples of the library architecture of the industrial age are also the cupola of the British Library in London from 1857 by Panizzi/Smirke and the Library of Congress in Washington from 1897 by Smithmeyer and Pelz. The reading rooms were panoptically arranged, respectively radial and concentric. Many public institutions from this period were built as panopticons, where you could supervise the building from its center. The Library of Congress also had a monumental staircase, which was a new representative element in library architecture.

THE ANGLO-AMERICAN MODEL

In the course of the nineteenth century a more publicly oriented form of library developed in England and in the

United States. The “free public library” had its roots in places that served simultaneously as bookshops, subscription libraries, readers’ associations, and literary salons. In both countries the social background for the development of the new public library movement was the mass industrialization and urbanization of the nineteenth century. An important conception was the library’s central role in education, enlightenment, and democracy. The ideal was that library materials should be available to all, regardless of class, race, origin, language, or education. These libraries were often founded and funded by private patrons of culture and education (Fig. 4).

In terms of architecture and interior design library buildings became steadily grander, more numerous and more prominent as features of the cityscape, with monumental facades in historical styles, often including classical elements that expressed the enlightenment tradition. Whereas the reading room had been the central feature of the classic European libraries, the lending department now became the most important room of the library. At the same time the introduction of new technology and the

increase in the number of users, including women and children, led to greater specialization in the use of space.

Women and children were by no means unknown in the subscription libraries. Special women’s reading associations were organized and special departments were established in the public libraries, which served as respectable public meeting places for women and reflected the Victorian segregation of the sexes in all sorts of contexts, from schools to public beaches. Women’s reading rooms tended to be furnished in a more homely style, with carpets, polished furniture, curtains, fan palms, and fireplaces. By the end of the nineteenth century special library rooms with appropriate furniture were established for children in both England and the United States. Many large libraries had both academic and public sections.

Serving a larger public, libraries began to organize their space and their methods of distribution more strictly and professionally. Lending to larger numbers of people meant standardizing classification, arrangement and marking of books and routinizing library procedures, including those for borrowing and returning. Advanced systems were introduced for physical transport of books and information both inside and outside the new libraries. The big American public libraries developed all-purpose systems involving small carts for moving books around internally and horse-drawn vehicles, later superseded by cars, for external transport. At the same time extensive systems of branch libraries and deposit stations, mobile libraries, traveling libraries, and book distribution boxes were developed.

In several American cities, including Boston, Chicago, New York, Detroit, and Indianapolis, striking new free-standing buildings were erected to house the libraries. Boston Public Library was built between 1887 and 1895 as a “people’s palace” by the architects McKim, Mead, and White. The facade and parts of the plan were clearly inspired by the *Bibliothèque St. Genevieve*, which in turn had been inspired by Boullée’s projects. This inspiration was evident in both the exterior and the interior: in both the main facade and in the placing of the large reading room, Bates Hall, on the first floor. Divided into Bates Hall, with its scholarly literature and donated special collections, and Lower Hall, with its public book collection, the library integrated elements of both the scholarly libraries and the modern public libraries. Book ordering was automated, with the orders delivered by pneumatic post to the stacks, whence the books were transported in little wagons by miniature electric railway. The library moreover had 10 ancillary branches and a total of 17 lending facilities.

While these large library buildings were built as compact “boxes” in classical or renaissance style, or in the special style dubbed “renaissance classicism” that referred to the classical cultural tradition, the architect Henry Hobson Richardson built a number of libraries in free Mediaeval style, with especially Romanesque elements

Fig. 4 Duffield’s and Weller’s Public Library and Literary Salon was founded in Cheltenham in 1822 as a bookshop, subscription library, and literary salon. It was not until the late nineteenth century that larger and more monumental public library buildings were erected in cities in England and America. Copperplate from circa 1850.

such as the Winn Memorial Library (1877–1878) and the Crane Memorial Library (1880–1883). The exteriors of these buildings were expressive and rustic, with rough-hewn stone, solid round arches, high gables, and asymmetrically placed turrets; inside, however, logic reigned, with the rooms all following in orderly sequence. Richardson's style was associated internationally with the Anglo-American library model and can be seen as the prototype for early Scandinavian public buildings, including the Dickson Public Library from 1897 in Gothenburg in Sweden and the Bergen Public Library from 1917 in Norway.

In addition, the Scottish–American steel magnate Andrew Carnegie funded no fewer than 2509 libraries throughout the English-speaking world. These libraries, built as miniature temples of knowledge, belong to a distinctive category of their own. To begin with Carnegie supported a plethora of charitable initiatives. In his essay *The Best Fields for Philanthropy* he listed seven fields: universities, libraries, hospitals, public parks, meeting and concert halls, public baths, and churches. But the best gift that could be made to a local community, he argued, was a public library.

In the first decades of the twentieth century some libraries were built as high-rise buildings as for example the John Crerar Library in Chicago (1920) and Yale's Sterling Memorial Library (1930), which provided an effective means of storing and transporting an ever-growing number of books. The John Crerar Library had a central location in Chicago next to the Chicago Public Library. It occupied premises from the 6th to the 14th floor, with reading rooms on the top two floors and each floor containing roughly 110,000 books.

In the interwar period library architecture and design were simplified and modernized. A good example can be seen in Los Angeles' all-white Art Deco main library, built by Bertram Goodhue in 1926. The exterior reflected both Indian and Mexican elements, which were combined with symbols of knowledge from Western cultural history. Inside, the cupola of the big central rotunda was decorated in 1927–1932 with murals depicting themes from California's history through the ages. Four different panels illustrated, respectively, the discovery of California, the Spanish mission, the Americanization of the state, and the founding of Los Angeles. At the top of the building's pyramid-shaped roof a gilded hand held a man-sized torch in turquoise terracotta—The Light of Learning—to express the library's mission of enlightenment.

OPEN ACCESS

The introduction of “open shelves” or “open access” around the turn of the last century was an important and much-discussed prerequisite for the development of modern public libraries. Open access heralded a whole new

form of library space, but gave rise to great debate and was usually introduced in several phases.

In the United States, open shelves in the modern sense were introduced from 1890 onwards, with the libraries in Boston and Cleveland leading the way, while in England they appeared for the first time in 1894 at the Clerkenwell Public Library in north London. In Denmark, they were introduced in 1902 with the establishment of the State Library in Aarhus, where the reading room was equipped with a special lending department. In 1909, a 1:1 model library, that was presented at a national exhibition and was intended as a prototype for future library buildings, was equipped with open shelves. The library was built in conjunction with a public meeting hall and served as a working model during the exhibition period. In England, only 70 out of 550 public libraries had open shelves in 1910, but from 1916 onwards open access became the norm. Thus the development was almost synchronous in North America, England, and Scandinavia.

Internationally the introduction of open access gave rise to heated debate. Advocates of the new system emphasized that it was a democratic, public-minded initiative that allowed borrowers to choose books on a more informed basis. Opponents put forward a great many arguments: there was a greater risk of theft or of books being misplaced and becoming impossible to re-locate. They also criticized lazy librarians who were bound to stay at their desks and not bother to help borrowers. There was a danger indeed that librarians would become redundant and perhaps be paid lower wages. There was a debate as to whether open shelves were more educational, since they allowed borrowers to orient themselves (though only among books that were not lent out) or whether, on the contrary, the closed-stacks system was better, because it forced borrowers to search systematically in the catalogs.

This discussion was accompanied by a number of compromises between open and closed shelves, usually in the form of gates at the counter or shelves protected by wire netting. Special book “cages” with wire netting were developed, that allowed the borrowers to see the backs of the books displayed with the relevant number or short text. In the Deichman Library in Oslo a special “cage” was set up in the youth department, so that children and young people could point out to the librarian the books stacked behind the net (Fig. 5). The Town Hall library in Copenhagen (built 1905) with shelves protected by netting offers a good example of the transitional methods adopted at the time. The introduction of open shelves was accompanied by a panoptic organization of the library, in which the librarian was placed at a counter at the center of a fan-shaped arrangement of bookshelves. This enabled him to survey the entire room so that he could assist borrowers in their searches and counter any problems with misplaced books or theft. The panoptic arrangement of libraries culminated in the 1920s.

Fig. 5 Book cage in the Youth Department of the Deichman Library in Oslo from around 1900.
Source: Aschehoug.

To serve the growing library readership efficiently a modern counter was introduced that became the centerpiece of the panoptic arrangement of furniture. This type of counter incorporated a number of practical functions relating to lending and correspondence and could be used in many types of premises, serving the borrowers as they passed to and from the open shelves. Gradually it became necessary to extend the library's initially rather small office area, and some of the pressure on the many functions of the counter was relieved.

Open access was thus an important part of the creation of a new library space in which the borrowers could walk freely about the premises, browse among the shelves, and chat with one another. They could find and read the books they were looking for, but they could also stumble on something unexpected. These possibilities were important aspects of a new type of library and a new library identity that the room itself both expressed and helped to create. This new openness would later be related to the open, flowing, and transparent space of modernist architecture. Borrowers were no longer bound to present their wish lists to a librarian behind a closed counter. Borrowing was simplified by replacing long forms with the simple method of stamping a loan card.

THE LIBRARY AS A TEMPLE OF KNOWLEDGE

With the open-shelf system, new library technology and the standardization of library routines for cataloging, classifying, and lending books, an international model was created that had a crucial influence on the development of the physical design of public libraries in the first half of the twentieth century. An important aspect of this library model was the almost standard division into an adults' lending library, a reading room and a children's lending library/reading room.

Both in terms of architecture and interior design the many Carnegie Libraries—often quite small, yet monumental and temple-like in appearance—became highly influential internationally, offering model planning solutions for libraries of various types and sizes. Andrew Carnegie's secretary James Bertram drew up a set of guidelines in his *Notes on the Erection of Library Buildings*. Here he set out six practical planning solutions for libraries of various sizes, which with suitable advice could be freely adapted by local architects to meet local needs. A feature common to all these plans was a flight of steps at the center of the building, leading up to an elevated ground floor with a reading room on one side, an adult library with a centrally placed counter in the middle, and a children's library on the other side. Together, the steps and columns emphasized the loftiness of knowledge (Fig. 6).

The ideal form of the classical "temple of knowledge," "temple of enlightenment," or "temple of books" involved a symmetrical ground plan, shaped like a "butterfly" with the entrance and the adult lending library representing the body in the middle axis, and the adult reading room and children's library forming the "wings." The form could be compact like a basilica with a central nave, with the wings folded into the body, or the wings could be spread out to form a T-shape. Often the middle axis served to connect the library building with its surroundings. This classical monumentality was further underscored by the high steps that led up to the entrance, often with columns. The symmetrical design continued into the front hall and on into the adult lending library, culminating in the counter or librarian's desk, which commanded a view of the whole room.

The main catalog with its record of the library's holdings was likewise placed on the middle axis, and frequently a clock embellished the center of the end wall as well; these features symbolized order—in both time and

Fig. 6 Carnegie Library in Decatur, Alabama, built 1903.
Source:<http://www.plannersweb.com/publicbldgs/LIB-DecaturAL.html>.

space—in the library’s comprehensive collections. The ground plan of the building, its interior design and furnishings and the arrangement of the books all served to express objectivity, stability, and solidity.

The “trinity” formed by the division into adult lending library, reading room and children’s library became the archetypal plan of the temple of knowledge. From the outside, the ground plan and the building itself could be read as forming a secularized temple of enlightenment and the interior a secularized basilica, based on the model of the mediaeval church with a nave and aisles. Thus the temple of knowledge was at the same time sacred and secular, both in terms of architecture and interior design. Moreover, the three types of library rooms were distinct in terms of function, codes of behavior, and the identity of the librarians who served in them. The distinction between the three types, however, was stronger in Europe than in America.

The adult lending library was the central room of the public library. It usually took the form of a symmetrical gallery with high windows or top lighting. This arrangement emphasized the loftiness of the room and the many meanings of light. With its open shelves the adult lending library represented the library’s intention to reach out to the great reading public, to whom it offered professional guidance and modern methods of lending. The borrowers could search and browse freely among the shelves and it was possible to converse normally. The ideal librarian of the adult lending department was seen as an active communicator of culture, with special experience and skills in choosing the collection of books.

The reading room was the place for enlightenment, concentration, and reflection, and often included special rooms for study. It was also associated with reference work, which in its modern form was an important part of the identity of the library profession. With rules enjoining users to converse in low voices and move around quietly, it was also the room with the most regulated behavior. It

contained a collection of practical, informative reference books designed for purposeful study. Newspapers could also be read here if there was no special newspaper room. Newspaper reading harked back to the recreational reading rooms, often designed to be social places where the public could take shelter in the warmth. Although newspapers played an important role in the political arena, the perusal of newspapers did not enjoy the same high status in the library world at the time, with its lofty ideology of enlightenment, as did the use of reference books. Moreover, newspaper reading could disturb the peace and concentration of the reading room. Often newspapers were stored in tall reading stands, which precluded barely tolerated users from sitting down, getting comfortable, and wiling away the hours.

Finally, the children’s library was oriented toward the reading, education, and enlightenment of the coming generation. Initially, libraries simply provided special shelves with books for children. Later, special children’s rooms were introduced, which in larger libraries were further divided into a lending department and a reading room. Although the children’s library was the liveliest and freest room, it was furnished in the same style as the adult library, albeit on a smaller scale. However, the children’s library was often specially decorated and in some cases equipped with a story-telling space for reading aloud.

Among the qualities of the temples of knowledge were their recognizability, regularity, clear functional division, spaciousness, and airy premises with good high ceilings. It is somewhat paradoxical, however, that the public library as a supremely democratic institution should become associated with a relatively closed and pompous style of building.

The Stockholm City Library offers a good example of the way in which the temple of knowledge was architectonically refined. It was designed by the Swedish architect Gunnar Asplund and built between 1924 and 1928. The simple geometric ground plan consisted of a circle inscribed in a quadrangle, corresponding to the central cylindrical building which rises above the four wings. The monumentality of this cylinder corresponded to the cupola of the British Library and the cupola of the Library of Congress in Washington. The building had four virtually identical facades. From the entrance hall one ascended a long, narrow “scala regia” which lead like a dark passage to the great, light lending room, formed as a rotunda with two circular book galleries, containing Swedish and international fiction, poetry, and drama. Non-fiction, which was considered the highest form of educational literature, was placed in two halls in the side wings; here you could find reference books and borrow scholarly or technical works on different subjects. The division of books into different subject areas, and the amalgamation of reference and lending collections, were novelties in librarianship.

PUBLIC LIBRARIES IN CENTRAL EUROPE

In Central Europe the closed-stacks system remained the rule in public libraries right up to the decades after World War II. A German survey of library buildings in 1930, *Der Volksbüchereibau*, explained the reasoning behind the closed system and illustrated its use in German public libraries. It was alleged that the English “Freihandbibliothek” (“free-hand library”) deprived readers of the opportunity for individual, qualitative, in-depth enlightenment that was the hallmark of the German public library’s educative tradition. It was criticized that in the English open-access library the reader did not engage directly with a librarian. German public libraries in the Weimar period retained their closed stacks with sober dispatch rooms for ordering and borrowing books. Whereas the adult lending room was the main room in the Anglo-American and Scandinavian open-shelf libraries, the closed stacks, often with several dispatch rooms attached, were given pride of place in the German public library buildings of the time.

It is interesting to note that the first public libraries with open shelves in Germany were introduced in Bremen in 1939 and in Hamburg in 1940 under the Nazi regime. The Nazis were eager to have a public-minded and effective library service in which they fully controlled the contents, just as they recognized the benefit of using mass media such as film and radio for propaganda purposes. After World War II, the Amerika Gedenkbibliothek, established in West Berlin in 1954, was equipped with open shelves that served as a model for public libraries in post-war democratic Germany.

In Austria the social democratic workers movement introduced large-scale buildings of public housing in “Red Vienna.” These great buildings consisted of numerous small apartments that were designed to solve the city’s housing problems, but at the same time included a number of communal facilities such as kindergartens, public baths, and libraries that reflected the ideological emphasis on health and culture. The libraries in these Viennese apartment blocks were generally the same size as an ordinary apartment and furnished as reading rooms without direct access to the actual books. Reflecting the ideological and political significance of knowledge, the library in Sandleitenhof had the following inscription on the wall: “Bücher haben uns in die Sklaverei gebracht. Bücher werden uns wieder befreien.” (“Books have enslaved us. Books should liberate us again”). The Viennese workers’ libraries are interesting because they were conceived as part of an overall cultural-political plan that embraced all aspects of leisure: health, body culture, reading, adult education, enlightenment, and political activities. The Viennese apartment block libraries exemplified politicized institutions, as did, to an even greater extent, the Soviet workers’ clubs, which were dominated by Communist Party propaganda, but which were also at the beginning an arena for experiment in architecture and interior design.

RUSSIAN EXPERIMENTS

After the Russian Revolution in 1917, libraries were seen as an important prerequisite for creating a new socialist society in the Soviet Union. The Russian constructivists contributed to a number of projects in this regard, ranging from utopian cultural centers built in soaring avant-garde style to practical proposals for the design of “workers’ clubs” that were conceived as breeding grounds for the new culture. For the Soviet Union’s exhibition pavilion at the World Exhibition in Paris in 1925 the artist and designer Alexander Rodchenko had set up a model of such a workers’ club. The idea behind the project was that after a long day’s work the worker could relax with some politically enlightening reading, chess and good fellowship in simple proletarian surroundings without bourgeois carpets, polished furniture, or curtains. The club was furnished extremely austere with a long narrow table and chairs, shelves for journals and magazines, a chess table with seating for players, a blackboard and photographs of Lenin. One wall could be used for slide shows. Rodchenko’s proposal was never put into practice and never exhibited in the Soviet Union.

One of the most experimental library projects in the 1920s was Ivan Leonidov’s 1927 model for a Lenin Library or Lenin Institute of Librarianship in Moscow, which together with Tatlin’s tower and El Lissitzky’s Proun room became one of the icons of Russian constructivism. The Institute was conceived as the Soviet Union’s collective information center with space for 15 million books, 5 reading rooms with seating capacity for 500–1000 people, and an institute of librarianship. The project also included a balloon-shaped planetarium and flexible auditoria. The library would be automated, with systems for transporting books horizontally and vertically. As a building complex, it was composed of various soaring geometrical shapes with plenty of potential for expansion. The materials to be used were glass, steel and concrete, and the library would be connected with the city via the metro and aerodrome, and with the world at large via a large-scale radio station. It was also an interesting novelty to conjoin a working library with an institute of librarianship. Leonidov’s “information architecture” without doubt constituted the most advanced library project in the interwar period. Quite how advanced it was, can be seen if one compares it, for example, with the main libraries in Los Angeles and Stockholm from the same period. Leonidov’s library, on the other hand, was never actually built.

Leonidov also developed open plans for cultural centers and “clubs of a new social type,” in which film and radio would function as “living newspapers.” His projects were criticized for being too utopian, and he was charged with “left deviationism.” Leonidov’s advanced projects, in which the library was seen as a universal communications center in an experimental information architecture of iron

and glass constructions anticipated present challenges to the traditional library space.

In 1928–1939 the Lenin Library in Moscow, designed by Shchuko and Gelfreikh, was erected in Moscow as the national library of the Soviet Union. This was a far more traditional and classical building than that envisaged in Leonidov's project. The entrance was constructed with pillars in polished black granite bearing a frieze of workers and peasants. The library interior, which served traditional library functions, was designed in the same historic style as the Moscow metro stations of the same period, with polished stone floors, pillars, circular chandeliers, and coffered ceilings.

THE SCANDINAVIAN MODEL

During the interwar years a new type of Scandinavian library arose, that reflected the growth of the welfare state, the cultural movements and the modern architecture of the time. It was less monumental and more oriented toward ordinary everyday life than the temples of knowledge. The hallmark of the Scandinavian model was its combination of modernistic experiment with traditional library design.

International modernism was first introduced in library architecture by Alvar Aalto's library from 1935 in Viborg/Viipuri in Finland, which at that time was Finland's second largest city. The building consisted of white cubic shapes with a large entrance in glass, but also had inner organic features. The library was set in a park, and Aalto envisaged the white walls being brought alive both in summer and winter by the shadows of the park's trees.

From the entrance one went up to the lending library, where the counter stood as the culminating point, modeled as a small mountain of the Finnish landscape, at the end of a symmetrical staircase. The sunken part of the lending library offered a new interpretation of the classic gallery library. Natural and traditional light wooden materials were used extensively, and the wooden ceiling in the lecture hall was organically folded. The idea was to distribute the sound in the long auditorium and thus make the room more democratic, with everyone being able to hear everyone else. Aalto later designed several libraries.

Nyborg Public Library was one of the last new libraries to be built in Denmark in the interwar period, and with its combination of tradition and modernity it represented in several ways a synthesis of Scandinavian cultural politics and library architecture of the period. The library was designed by Erik Møller and Flemming Lassen and was completed in 1939. It consisted of two red brick wings, joined by a low glass passage, which formed the entrance to the library and its garden, and like a greenhouse united the exterior with the interior. The simple entrance was markedly different from the grand steps and high doors that characterized the temple of knowledge.

The library's various functions were carefully designed with regard to both overall unity and the needs of the individual user. The interior was designed especially for Nyborg Public Library with the assistance of furniture designer Hans J. Wegner. Chairs, tables, bookshelves, and wall panels were made of sycamore wood. The free-standing shelves projected out from the walls, allowing a view through the windows to the town's houses and canals (Fig. 7).

This open, user-friendly architecture and design brought the library closer to everyday life. With its accommodating form, it was a break with the monumental tradition of the time and became an example of a new type of library architecture where easy access, freedom of movement, spacious rooms, and the use of light wooden furniture were expressions of democratization and public enlightenment. The Scandinavian model with its open, informal, and familiar-looking library buildings, often of high architectonic quality, became an inspiration for library architecture in the following decades.

FLEXIBILITY, FUNCTIONALITY, AND MODULARITY

After World War II library buildings expanded, influenced by the ideas of modernist architecture and rational planning of space and functions. Modernism influenced library architecture in the direction of the sober and down-to-earth: "No columns, no pillars, no arches, no ornament, no contrived monumentality" as the architectural historian Nikolaus Pevsner put it. After the war there was a movement toward library environments that were "light, spacious, and informal." Library space became even more open and transparent. In urban planning, these modern libraries became part of the new cultural centers of the suburban landscape.

Another aspect of modernism in library architecture, but also as a consequence of a new rationality in library planning, was the development of modular systems with structural columns. These systems made massive load-bearing walls unnecessary and at the same time they made flexible interior functions and furnishings possible. Walls were temporal and could be removed according to changing needs and functions. The idea of the module was twofold: to ensure that the bookshelves could be located anywhere in the library (providing flexibility) and to position the structural columns so they would not interfere with the spacing of bookshelves (providing functionality). The keywords of library planning in the decades after the war became flexibility, functionality, and modularity.

Much attention was paid to standards of space and furnishing. Needs of space for staff and users were defined. As seminar-style teaching became more common, it seemed important to merge study space with book storage space in libraries with educational purposes. The

Source: Folkebibliotekernes Bibliografiske Kontor.

ideals of library service and design were to create inviting and pleasant as well as efficient interiors, combined with well-organized and coordinated architectural elements. While the ideals were very attractive and progressive, the buildings themselves—with consistent ceiling heights, large floor-plates, and artificial lighting—tended to become monotonous. Rectangular buildings and furnishings became typical with the book as “the real library module.”

An artistic and minimalistic version of the modular library in glass and steel is the Martin Luther King Jr. Memorial Library in Washington DC, designed by Ludwig Mies van der Rohe and completed in 1972. A special and elegant expression, that is only modular in its architectural expression, is The Beinecke Rare Book & Manuscript Library from 1963 at Yale, designed by Gordon Bunshaft from Skidmore, Owings, and Merrill. A six-story above-ground tower of book stacks is surrounded by a rectangular windowless building with walls made of a translucent marble, which transmit subdued lighting and provide protection of the historical collections from direct light. The marble wall makes the building look quite different from the outside and from the inside.

An almost futuristic example of library architecture from this period is The Marin County Civic Centre in San Rafael in California from 1960, designed by Frank Lloyd Wright and containing public administration, library, and auditorium. The grand tunnel-like arches make the center look both classic and modern. Worth mentioning in this context is also the extension of The Boston Public Library from 1967 to 1971 by Philip Johnson, built in the same pink granite as the historical building and repeating the architectural elements in simple and abstract forms. The extension houses the circulating parts of the library. With its massive walls, it is often compared to a mausoleum. The “half-moon” windows and “rounded columns” are almost post-modern. The Exeter Library in New Hampshire by Louis I. Kahn from 1967 to 1972 has some of the

same monumentality with square form and brick piers. In the inner space, the reading room is a central hall encircled by balconies with books and study alcoves. The reading room is overlooked through giant circular openings in the interior screen walls. The light comes from above through a diagonal cross of concrete. All constructions and materials are visible.

In Berlin, the State Library from 1967 to 1978 by Hans Sharoun represents the period of late-modern architecture, but not the modular thinking. On the contrary the State Library like the nearby Berlin Philharmonic Hall, also by Sharoun, are examples of modern expressionistic architecture, going back to alpine and crystalline architectural visions from Sharoun’s youth in the early decades of the century. The exterior of both buildings is covered with aluminium plates, colored yellow. Inside the State Library the reading room is located on the third floor, with triple floor height of 9 m. Hanging mezzanines with sharp edges are part of the inner complex constructions. Books are delivered from a closed-stack system by request.

SPECTACULAR LIBRARIES AS PUBLIC PLACES

Around the turn of the millennium new tendencies in library architecture and design have occurred. The development of new media and digital information technology has challenged the traditional library with different visions of “the library without walls,” but it has not weakened, rather apparently heightened international interest in the library as a physical space.

Especially, a series of grand metropolitan libraries has been built around the millennium. Almost as “icons” these “new downtown libraries” as well as museums and other spectacular buildings have become a parameter in the competition between great cities of branding themselves and attracting the creative and wealthy classes. However, the intentions are also to revitalize the inner districts of the

metropolitan areas. The post-modern architectural expressions, interiors, media collections, and organization of these highly visible buildings may vary. Typically libraries develop as multiuse public spaces, where collections of books and other materials are important, but in connexion with educational, cultural, and social activities. Often libraries are defined as “third places” in society between home and work. In some of these initiatives the experience economy plays an important role. In other contexts the significance of the library as a place of retreat and reflection is emphasized. The concept of “open access” and “open space” has thus become even more important in library architecture.

Whereas the decades of modular libraries were dominated by ideals of systematic planning, also for the future, the millennium period is characterized by rapidly changing functions and experiments. The architectural styles go from classical symmetrical buildings with columns and decoration, almost like the historical Carnegie libraries, such as the new libraries in Chicago and Nashville, to the deconstructed colosseum of the library in Vancouver and the ice pack of glass and steel that marks the library in Seattle.

Especially the new public library of Seattle from 2004, designed by architect Rem Koolhaas of the Dutch firm OMA (Office for Metropolitan Architecture) has been discussed as example of the new iconic library architecture. The history of Seattle’s main library is in itself a show-case of the development of twentieth century library architecture at the same site in downtown Seattle. A Central Carnegie Library was opened in 1906 as a typical temple of knowledge in Beaux-Arts design. It was replaced in 1960 by a modular library in five stories in international style that contained special facilities such as a drive-in service window, where patrons who ordered books in advance could pick them up without having to get out of their cars. The library from 2004 is an 11-story crystalline building with striking appearance among the high-rise office buildings of the area. The glass and steel net is the skin around the inner floating platforms. At ground level you find the Microsoft auditorium and on the third floor the open “living room” with several activities including reading. From here the escalator will take you to the “mixing chamber” with a computers and professional help, and you can continue to the four-story “book spiral,” where the non-fiction collection is placed in a continuous series of shelves according to the Dewey Decimal System, without breaking the collection up onto different floors or sections. On Level 10 you find quiet areas of reading, local history, and administration. As an ideal the library design tries to combine fixed and flexible functions.

The iconic status is corresponding to other spectacular downtown library buildings such as Chicago, Denver, Las Vegas, Los Angeles, Nashville, Salt Lake City, and San Francisco, trying to be part of the experience economy, to

create multiuse public spaces and to anchor community development of inner city areas.

In a smaller scale the public library of Cerritos, south of Los Angeles near Disneyland, is an example of an experience and learning library, where each room of the library tells a story. Already outside the library you are met by futuristic sounds, old films, or public announcements. Inside the ground floor is organized around a “Main Street” with palm trees. To your right you find “The Old World Reading Room” with soft carpet on the floor, a fireplace, chandeliers, and dark wooden shelves with old editions, inviting you to sit down and read. To your left is the spectacular children’s library with an entrance of over-size children’s books, saltwater aquarium, a dinosaur reconstruction, a lighthouse, and a changing sky. Moving through Art Deco-shelves of the central book collection or proceeding up the escalator you will reach the twenty-first century level in futuristic design with computer stations and study rooms. This postmodern library design represents the opposite of the modular library other more minimalistic tendencies around the millennium.

Also in Europe a series of spectacular libraries have been built. In Paris the Bibliothèque Nationale de France was erected 1988–1995, designed by Dominique Perrault. The library is situated in a former industrial wasteland at the banks of the Seine. The four corner towers of the building can be interpreted as open books with symbolic meaning, and the inner courtyard with trees can be experienced in relation to Naudé’s thoughts about the importance of library gardens and Labrousse’s painted artificial landscapes. Around the garden specialized libraries are arranged on mezzanine levels with deliverance from the towers, that are housing stacks and administration.

In London the British Library near St. Pancras Station was begun in 1982 and opened in 1997, designed by Sir Colin St. John Wilson. Red brick materials and colors are corresponding the old station, but the modernism of the new library building is contrasting the Neo-Gothical Hotel and Station. The library is situated in central London. The portico, the piazza, and the amphitheater connect the library with the surrounding urban space. The building has four floors below ground. The exhibition galleries with easy general access are located at two floors at ground level and the three top floors contain reading rooms with daylight. The library is crowned by a roof garden.

In Copenhagen “The Black Diamond” was built as an extension to The Royal Library as part of the creation of a new harbor promenade with several cultural activities and institutions. It was designed by the architects Schmidt, Hammer, and Lassen and opened in 1999. The name refers to the sharp prismatic edges and its surface of black granite and glass, reflecting the water of the harbor. The black surface is contrasting the inner open spaces with reading rooms in light wooden materials in Scandinavian style. From the wave-like balconies of the central foyer, that cuts into the building as a 24-m high atrium, there is a

panoramic view over the harbor. The seven floors of the building contain not only traditional library functions such as the four reading rooms, but also a concert hall, exhibition galleries, bookshop, café and restaurant. A small Jewish Museum, designed by Daniel Libeskind, has been integrated in the old red brick library cathedral from 1906, designed by Hans J. Holm.

Other examples of metropolitan libraries are the Main Library of Amsterdam by Jo Coenen from 2007 with multimedia and multiuse space and the main Library of Vienna by Ernst Mayr from 2003, built over the underground system. A special experiment in library architecture is the Library of the Delft University of Technology by Mecanoo from 1993 to 1997, where the roof of the library is transformed into a green campus. The futuristic design makes the library look like a landed spaceship. The Madrid Regional Documentary Center by Mansilla + Tunón from 1994 to 2002 is an example of adapted reuse of historical industrial architecture, in this case a former brewery.

GLOBALIZATION

Another important issue of library architecture around the millennium is globalization, both of communication networks and access to information, but also of library architecture and design. Especially in Japan, China, and South East Asia new library buildings are expanding and experimenting with the possibilities of new information technologies. Some of these buildings are built in regional styles, but often they are representing the same “monumental futurism” as the library buildings of the west. In 2003, the international library organization IFLA published *New Library Buildings of the World*, that is an international survey of spectacular new library buildings, documenting this development, where library architecture is becoming increasingly international.

An interesting example of Japanese library architecture is the Sendai Mediatheque, designed by Toyo Ito and completed in 2000. This “mediatheque” complex combines a library, an art gallery, and a media center of visual images. The open space building is defined by three elements: “plate,” “tube,” and “skin.” The “plates” are the six horizontal squares, representing the different media, connected by the 13 vertical “tubes” with flow of information, energy, water, light, and sound.

The “skin” is the outer layer, separating indoors and outdoors of the building. The glass façade is facing the main street, making visual contact possible both from the outside and the inside.

In China some of the new library buildings are reflecting regional architectural traditions such as the National Library from 1987 and the Peking University Library from 1998. The Shenzhen Library 1998–2003 is designed by the Japanese architect Arata Isozaki. It is a

Fig. 8 The Bibliotheca Alexandrina at the Mediterranean Sea.
Source: webmaster@nile.co.za.

cultural center that also contains a concert hall. The large open spaces have visible constructions and hanging escalators.

One of the most ambitious cross-continental and cross-cultural library initiatives is the new library of Alexandria. The Bibliotheca Alexandrina was designed by the Norwegian drawing office Snøhetta and opened in 2002. The library is sited by the water front avenue in the same district, where Greco-Roman remains were uncovered in 1996, and overlooks the Mediterranean Sea. As the ancient Egyptian image of the sun the library concept is a circular building, inclined toward the sea and submerged into a pool of water. The wall is of Aswan granite with calligraphy, inscriptions and signs from alphabets and civilizations from all over the world. The ideals of the library are both to combine history with the present and to connect different cultures, languages and parts of the world (Fig. 8).

Library Automation: History

Robert M. Hayes

Department of Information Studies, University of California, Los Angeles, Los Angeles, California, U.S.A.

Abstract

This entry provides a review of the history of developments in library automation in the United States. It discusses four contexts within which library automation should be seen, and does so within each of six time periods: 1) pre-1945; 2) 1945–1960; 3) 1960–1975; 4) 1975–1990; 5) 1990–2008; and (6) post-2008. In each time period, it reviews the societal context and the information technology context, and then two library contexts—technical services and information services.

INTRODUCTION

This entry provides a review of the history of developments in library automation in the United States (It is based in part on an earlier one: Hayes^[1]). It discusses four contexts within which library automation should be seen, and does so within each of six time periods: 1) pre-1945; 2) 1945–1960; 3) 1960–1975; 4) 1975–1990; 5) 1990–2008; and 6) post-2008.

Two of the contexts are external to libraries. One is the societal context, including publishing and the perceived role of libraries. This context is important for understanding the development of library automation because it is the environment within which libraries function. The other is that of the information technologies, the hardware and software that are the tools used in library automation.

Two of the contexts are internal to libraries. They include its management and technical services, on the one hand, and information services, on the other. For the purposes of this entry, “technical services” include those library operations involved in management of the materials acquired by the library: the processes in acquisition itself, in cataloging and classifying, in preservation and conservation, in collection control, including circulation. “Information services” include reference services, instructional services and guidance in use of the library’s collections, and access to databases and other electronic materials and services, both within the library and through the Internet.

The timelines for these contexts all interact and affect each other, and the discussion will highlight some of the interactions. Of special importance were developments in the commercial, industrial, and consumer sectors in society of parallels to those in the library and information science sectors. In many respects, though almost unheralded, developments of automation in libraries served as means for demonstrating the feasibility of their application in the larger arena. A specific example was the leadership of the

National Library of Medicine in proving the feasibility of high quality typographic output from computers, thus demonstrating that computer-controlled photocomposition was feasible. The use of online reference data services was first demonstrated in libraries and then found great acceptance in industry. As we proceed through this history, those kinds of interactions should be evident.

Also of special importance has been the effect of technological capabilities upon not only what could be done but upon the very perception of how to do it. This was evident in the early years, when the limits of punched card technology as well as the means for logical processing it embodied largely determined how people thought about using technology.

PRECURSORS OF LIBRARY AUTOMATION: PRE-1945

Although automation in libraries, as one normally thinks of it, is a phenomenon of the last 50–60 years, it is of value to recognize that there are precursors. Three of them represent elements of continuing importance.

First, Charles Coffin Jewett, as Librarian and Assistant Secretary of the Smithsonian Institution visualized a union catalog of the libraries in the United States. In 1852, he proposed the use of “stereotype plates” as the means for maintenance and production of such a union catalog^[2] (A stereotype plate is a metal plate containing a raised image of a page of type or engraving from which prints can be made). Clearly this represents an early stage in the development of automation, but it is more than that since it also represents the theme of cataloging as one of continuing importance that arises during each of the subsequent time periods.

Second, Dr. John Shaw Billings, head of the Library of the Surgeon General’s Office (which in 1956 metamorphosed into the National Library of Medicine, as will be

discussed later) was credited by Herman Hollerith with the basic idea of punched cards as means for data processing. According to Hollerith, Billings said to him, "There ought to be some mechanical way of doing this job (i.e., processing 1880 census data), something on the principle of the Jacquard loom, whereby holes in a card regulate the pattern to be woven."^[3] And indeed, Hollerith developed such a punched card system which was then used for the data processing of the 1890 census. His company, Tabulating Machine Company, later became IBM, and the Hollerith card dominated data processing throughout the world for 50 years. The punched card represents one stage, perhaps the first stage, in the development of means for data processing as a theme in this review of the history of library automation.

Third, microphotography dates from 1839 and was seen, from at least the early 1850s, as a means for preservation of library materials.^[4] In the ensuing 100 years and more, microforms (whether as microfilm, microcards or microfiche, aperture cards, or other forms) were increasingly used by libraries not only for preservation but as a means for acquisition and compact storage of materials, newspapers in particular. Microforms thus represent another continuing theme: developments of alternative means for publication and for acquisition and storage of library materials. In 1938, Eugene Power founded University Microfilms to serve as such a publisher.^[5] In 1943, Power and Watson Davis established the National Microfilm Association as means for furthering development of microforms for publication and for managing and using document collections.

Even earlier, in 1937, Watson Davis was instrumental in establishing ADI (American Documentation Institute, in 1963 renamed American Society for Information Science, ASIS, and in 1999, ASIS & Technology, ASIS&T) which was one of the professional societies instrumental in the development of library automation.^[6] Other professional societies key to that development were the Association for Computing Machinery, founded in 1947,^[7] and the Library and Information Technology Association (LITA, but originally Information Science and Automation Division, ISAD, of the American Library Association), founded in 1966.^[8]

EXPLORING THE POTENTIAL OF COMPUTERS: 1945–1960

Societal Context

During this entire 1945–1960 period, the United States was the dominant economic power in the world and the major producer of scientific research publications. The reason is evident: It was the only major country that had not suffered catastrophic losses during World War II. Its economic infrastructure was intact, as was its academic superstructure. Fortunately, it used its economic power

wisely, as best represented by the Marshall Plan that made U.S. resources available for the rebuilding of Europe and the Far East. From the standpoint of science information, at the beginning of this period (say 1948–1950), the United States produced more than 50% of the world's scientific publications.

From the time of Vannevar Bush, as the Science Advisor to the President, the needs for information in science and technology provided a continuing rationale for development of automated information management systems. Indeed, this period started with his frequently cited article, "As we may think."^[9] In a very real sense, it foretold virtually everything we have since seen in the developments presented here. Much though that article has been cited, however, a far more important document is the earlier 1945 report of the Office of Scientific Research and Development (OSRD) of which he was chairman. It urged that there be continued support to scientific research after conclusion of World War II and by doing so led to what in 1950 became the National Science Foundation and the National Institutes of Health.^[10]

Of specific relevance to this history, the OSRD report identified many of the continuing themes that have been important to library automation. It says, "It seems probable that use of cataloging and sorting devices now available in the form of business machines and microfilm technique might go far to improve present methods of searching the literature and making bibliographies."^[11] Indeed, by the end of the period from 1945 to 1960 the realization of that conjecture was well underway.

This was the period of the cold war, reaching its peak in the Korean War and the Cuban Missile Crisis. So there was a continuing emphasis on the needs for information services to support U.S. national defense. As the Cold War became more intense, the intelligence community—CIA (Central Intelligence Agency), National Security Agency, the intelligence arms of each of the branches of the Armed Services—required means for assembling, storing and retrieving, and analyzing massive amounts of data; their needs, more than any others, supported the development of computer hardware and software.^[12]

One of the most critical events came toward the end of this period—the launching of Sputnik by the Soviets in 1957—which shocked the military, industrial, and scientific establishment of the United States.^[13] The demands for automated systems reached a crescendo as a result of Sputnik and led directly to some of the most crucial developments in automation of libraries. The National Science Foundation launched its Office of Science Information Service to support development and implementation of automated systems and to sponsor the necessary research; of special importance was its funding of the automation of indexing and abstracting services, such as Chemical Abstracts Services.^[14–16]

It is also important to note that, consistent with the recommendations of the OSRD, health care and related

research became a priority of the federal government. The National Institute of Health, established in 1930 by the Ransdell Act, was greatly expanded, becoming the National Institutes of Health and encompassing many individual institutes.^[17]

During this period, publishing was much as it always had been. Composition was essentially manual. Though there were a few experiments with use of computer technology, they were completely outside the mainstream of commercial publishing.

The form of publication was simply print, using the traditional means for doing so. Xerographic means for duplication were just beginning to have an impact toward the end of this period. And the computer as means for publishing simply had not yet arrived.

Where then were libraries during this period? Indeed, there was increasing recognition of the importance of libraries, both as part of the activities referred to above and independent of them. Of great significance was the Library Services Act (later expanded into the Library Services and Construction Act) which, among other things, fostered the creation of library networks that have been of vital importance as automated systems became important to libraries.^[18] By the Medical Library Act of 1956, (Miles;^[19] Public Law 84-941, August 3, 1956:^[20] An amendment to Title III of the Public Health Service Act, the National Library of Medicine Act, placed the Armed Forces Medical Library under the PHS, and renamed it the National Library of Medicine) the Surgeon General's Library (first created in 1840) became the National Library of Medicine. At the end of this period, the National Library of Medicine launched its efforts to automate the production of Index Medicus.^[21]

In 1862, Congress had created the library of the Department of Agriculture, and in 1961 it too became a national library. (The "Organic Act of 1862", which established the Department of Agriculture, clearly identified the need for a library within it, and the first librarian was appointed in 1867. Over the years, the Department of Agriculture Library became, de facto, a national library but it was not officially designated as the National Agricultural Library until 1962, when "Memorandum No. 1496" of the Secretary of Agriculture did so).

All of these were clear recognition of the importance of libraries.

Information Technology Context

It is with a sense of shock that one compares the nature of the technology during that 15 year period with what we have today. At the beginning of it, data processing meant punched-cards and key-operated accounting machines (such as cash registers), with punched-tape (like teletype tape) as the "common language" for communication among such machines.^[22] Computers were limited in capabilities, in numbers, and in applications. While

computers were viewed as large and fast at the time, their capabilities were exceptionally limited.^[23]

The first computers for application in business and similar operations (among which would be included libraries and information services) appeared in the early 1950s, and "main-frame" computers became widespread by the end of the period. But all of that equipment suffered from the lack of adequate means for input, storage, display, and output of data. Punched cards and punched tape were the only means for input, and they operated at data rates roughly equivalent to 10 characters per second—the speed of teletype! Vacuum tubes (cathode ray tubes or CRTs, as they were called) and then, later, magnetic cores were the means for storage of operating programs and data while immediately being processed; but both were exceptionally expensive and limited in capacity—60,000 bytes would be a big internal memory! For large-scale data storage, there were magnetic tapes and magnetic drums—each slow and with inherent limitations in the ways they could be used. For display, there were the most primitive CRT units, with low resolution and presenting only limited amounts of data. And the means for output were punched card tabulators, with uppercase only fonts and operating again at the equivalent of 10 characters per second. Thus, even though the computers were fast, there wasn't much they could do, given the limited internal memory; they were inherently limited by capabilities for storage of large files and the slow speed of input and output.

However, during this 1945–1960 period technological developments of profound importance were taking place. Specifically, at the beginning the electronic components were essentially vacuum tubes. But the invention of the transistor in 1948 led rapidly to supplant vacuum tubes in computers and then the integrated circuit, first created in 1958, would become the basis for central processing units and make microcomputers possible (For a history of the transistor, see PBS's Web site).^[24]

There was one other event of immense importance to technological development at the end of this period. In a talk at Cal Tech in 1959, Richard P. Feynman, the great physicist of our times, said,

I want to talk about the problem of manipulating and controlling things on a small scale . . . all of the information that man has carefully accumulated in all the books in the world can be written in this form in a cube of material one two-hundredth of an inch wide . . . Why can't we make (computers) very small . . . For instance, the wires should be 10 or 100 atoms in diameter, and the circuits should be a few thousand angstroms across. . . . If (computers) had millions of times as many elements, they could make judgments. . . . They could select the method of analysis which, from their experience, is better than the one that we would give to them.^[25]

Nanotechnology, based on that talk, is today the crucial basis for the future of computing technology.

Library Technical Services Context

During this period, there was at best slow progress in development of automation for internal, technical processing in libraries. Of course, there were the highly successful uses of microfilm in management of circulation records, especially in public libraries, and there were efforts to use punched-card equipment for that purpose.^[26] There were similar efforts to deal with serial records, again using punched-card equipment. For the core technical service functions—acquisition and cataloging—while there were efforts, the problems were great, especially with respect to the number of data entries involved and the overwhelming costs in converting them to machine-processable form.

Two among the experiments, each by Ralph Parker, were of historical interest. The first was his effort in 1930 at the University of Texas. He told the story about wanting to try using a punched-card system for circulation control. The then library director, Don Coney (later to become Director of Libraries at the University of California, Berkeley) said, “OK. Here’s \$300 but use it wisely.”^[27] The second was his effort, at the University of Missouri, to initiate an evolutionary approach to an integrated library records system.^[28]

By the end of this period, the Council on Library Resources (since 1997, the Council on Library and Information Resources; The merger of the Commission on Preservation and Access and the Council on Library Resources (CLR)^[29] became official on May 30, 1997 when the Board approved the new enterprise, the Council on Library and Information Resources, CLIR) had begun to play crucial roles in successive stages in development of library automation;^[30] they were of special importance in providing support to the National Library of Medicine in its effort to automate the production of *Index Medicus*^[31] and to the Library of Congress in its first explorations of the use of computer-based systems.^[32] More generally, they were concerned with alternative means for producing catalogs and making catalog data available.

In that respect, one of the important attempts to apply computers for access to catalog data was the production of book-form catalogs, especially for union catalogs. It’s worth noting again the historical efforts of Charles Jewett to use stereotypes for the production of a national union catalog, as referred to above.^[33] In Los Angeles, the County Library system experimented with the use of punched-card equipment for its own union catalog,^[34] and there was a similar effort in the 1950s in Seattle, Washington, at the King County Library System (“The King County Library System has embraced each new wave of technology over the years,” said KCLS Director Bill Ptacek. “Our first catalog was produced from IBM punch cards in the 1950s. . .”^[35]). While those efforts were essentially dead-ends in the context of later developments, they were important steps in the general progress.

Information Services Context

Given the requirements for information storage and access, focused especially in the intelligence community, computers were seen as a potential means for meeting them. Despite the limitations during this period, the expectations were that the technologies would steadily improve, so there were many efforts to solve the technical and theoretical problems in this field.

But at the beginning of this period, the methodologies for information retrieval were largely based on physical matching of search criteria with document data. In this vein, Calvin Mooers had developed Zatocoding as a means for using edge-notched cards, and Mortimer Taube had developed implementations of his Uniterm concept.^[36,37] The Intellofax system at the CIA did much the same thing, using punched card equipment, and Hans Peter Luhn at IBM developed a set of similar approaches.^[38] In a real sense, this focus on physical matching reflected the very nature of punched card logical processing which was based on direct connection by wires on a plugboard.

It is of interest to note that, at that time, even the attempts to apply computer technology to the tasks in retrieval started with physical matching of search criteria with document data, using optical coincidence. In particular, the Rapid Selector (the realization by Ralph Shaw, at the National Agricultural Library, of the Memex of Vannevar Bush) used optical matching; the Minicard system, developed by Eastman Kodak and the Magnavox Company for the intelligence community, similarly used optical matching; even the Western Reserve “Searching Selector,” developed by James W. Perry and Allen Kent, used an electronic counterpart of such matching.^[39]

The point is that those early developments had not yet recognized the capabilities of the computer for complex processing of recorded symbols, so it was not until the end of this period that the techniques of modern computer-based retrieval began to appear.

There was one development toward the end of this period, made operationally possible by use of computer technologies that deserves special recognition. That was the creation of the *Science Citation Index* by Eugene Garfield and his associates at the Institute for Scientific Information. It truly revolutionized the means for indexing of the literature of science, placing it in the hands of the users of that literature through their citations.^[40]

BEGINNING TO BRING COMPUTERS INTO LIBRARIES: 1960–1975

Societal Context

In retrospect, although it was not evident at the time, there was a steady reduction in the cold war conflict between the United States and the Soviet Union. The tensions were still

there, and the cold war conflict would periodically bubble up and then simmer down. But the focus moved into Vietnam and a real war.

The needs in the intelligence community continued, of course, but there was something else, more fundamental and ultimately revolutionary that had become the driving force for automation of information activities. That was the transition of the United States and, at a much slower pace, other industrialized countries, from being “industrial” economies to being “information” economies. Today that transition has impact on every component of our economy and our society, but it was during this period that the changes began to become evident. The report by Marc Porat on the information economy of the United States,^[41] clearly identified what was happening and the fact that by the mid-1970s over 50% of the nation’s workforce was engaged in information work.

It is important to note that, although many see the appearance of the information economy as something created by and driven by information technology, the cause is much more fundamental. It is the imperative in development of the society that has created it and the technology merely feeds and serves that imperative, making it possible, yes, but not causing it. In any event, the information economy, whatever the cause, was the driving force for developments in library and information science during this period.

Of course, the importance of science information continued to be recognized. The Department of Commerce established NTIS as one means to improve dissemination of scientific and technical information. The National Academy of Sciences repeatedly reviewed the status of developments and recommended increased efforts.^[42,43]

During this period, the processes of publishing were revolutionized, as computer-based photocomposition completely replaced the former manual methods. And xerography became a fact of daily life in business of every kind. From the standpoint of this history, though, the important development in publishing was the onset of electronic formats, as represented by the creation of databases, initially as a result of efforts by the U.S. federal government.

Information Technology Context

During most of the 1960–1975 period, computing was centered on large main-frame computers. In fact, what was called “Grosch’s Law” (named after Herbert R. J. Grosch) governed most of the decisions about computing installation.^[44] It stated that “computing power goes up as the square of the cost,” the implication of which is crystal clear: the bigger the better! During this period, the University of California developed the MELVYL system, initially visualized as a centralized university-wide library service in the spirit of Grosch’s Law.

In parallel, there was extensive development of networks among computers, starting from the work of the University of California, Los Angeles (UCLA) Western Data Processing Center (literally the first such network)^[45] and expanding into Advanced Research Project Agency Network (ARPANET), of the Department of Defense,^[46] and National Science Foundation (NSF) super-computer network.^[47] Together they became the backbone of today’s Internet (now supplemented by all of the commercial communication networks).

In 1962, Dr. Leonard Kleinrock published the basic principles of packet switching, the technology underpinning the Internet. The birth of the Internet then occurred when his host computer at UCLA became the first node of the Internet in September 1969.^[48] Of course, as we will see later, the impact of the Internet has been profound, not only on libraries but on the entire world.

Library Technical Services Context

It must be said that, even near the end of this period, there were at best mixed feelings in the library community about the use of the information technologies. Some librarians regarded it as a meaningless diversion of funds and efforts.

“In sum, our experience with the computer in library operations has been one more replay of The Emperor’s New Clothes, and what we were led to believe were distant mountains laden with gold, available merely by boring a drift in the slope, turn out, upon close inspection, to be the hairy buttocks of the well-fed computer industry. And from such a source we have gotten exactly what we should expect.”^[49]

But, during this period, despite such views by some librarians, there were increasing efforts to at least experiment with the use of library automation. A context of special importance in doing so were efforts to establish cooperative networks among libraries. Each of the states, under the stimulus of the Library Services and Construction Act, created its own state library network, intended to include public, academic, school, and special libraries together. Washington State, in particular, established the Washington Library Network (WLN) as an automated union catalog system for the northwest region of the United States.^[50]

In parallel, OCLC (originally Ohio College Library Network, then Online Computer Library Network, later simply as the term OCLC itself) was established by Fred Kilgour in Dublin, Ohio.^[51] And the Research Library Network (RLIN) was created as a part of the Research Library Group. Each was intended to serve on a national basis as means for dealing with the generic issue of retrospective conversion of catalog records, a dominant concern in the effort to introduce automation in academic libraries.

Cooperation in the area of cataloging was made possible because of the crucial contribution of Henriette Avram, at the Library of Congress, in establishing the Machine Readable Cataloging (MARC) format as the de facto national standard for exchange of catalog data; without that, it would have been intolerably difficult. Avram^[52–54] So, using the MARC format, WLN, OCLC, and RLIN could serve as economic solutions to the catalog conversion task, and automated systems to support cataloging and catalog access could be developed within institutions. At about the same time Stanford University developed the BALLOTS system; it later became the basis for the RLIN national bibliographic database system. IBM developed DOBIS for the University of Dortmund, in Germany, as an online catalog system.^[55]

In parallel, modules began to be developed at individual libraries to support other aspects of internal, technical services—circulation and collection management, serials records, and support to acquisitions. An example was the Leuven Integraal Bibliotheek Systeem (LIBIS) at the Catholic University of Leuven, Belgium. Although that was not in itself a United States development, IBM negotiated the right to market it with the DOBIS catalog system, as a quasi-integrated product.^[56] In 1971, Béla Hatvany founded Computer Library Services, Inc. to provide a minicomputer based library application, focused on circulation control.^[57]

Perhaps the first of the efforts to produce a truly integrated system was at Northwestern University and it became the basis for NOTIS, the commercial version.^[58] Roughly in parallel, was the Southwest Academic Libraries Cooperative Mechanization Project and the University of Chicago Library Data Management System. Each started in the late 1960s.^[59]

Information Services Context

As a result of all that had occurred during the 1945–1960 period, the production and distribution of bibliographic, indexing, and abstracting databases became a reality rather than merely a speculation. All of the research and technical development had come to fruition during the period 1960–1975, and with great success. Of special importance were the online services for access to the reference databases (such as Chemical Abstract Services, ERIC, and Medline). DIALOG was created by Roger K. Summit in 1966^[60] and ORBIT by Carlos Cuadra in 1967–1968,^[61] for example. Bibliographic Retrieval Services (BRS) was created in 1968 at State University of New York, Albany, and library OPACs (online public access catalogs) were developed by many individual libraries for access to catalog databases. Less dramatic but still important was the implementation of Interlibrary Lending (ILL) services by OCLC and RLIN.

COMPUTERS ARE ACCEPTED BY LIBRARIES: 1975–1990

Societal Context

This was a most remarkable 15 years! At the end of it, there was the end of the Cold War with the disintegration of the Soviet empire. The effects of these international events for library automation are less tangible, perhaps, but are very real. In particular, the separate republics of the former Soviet Union became independent countries each of which has needed to deal with the information revolution. And beyond them, other countries of Central and Eastern Europe which had functioned under the stultifying effects of Soviet-style communism faced similar needs. The Soros Foundation^[62] and the Mellon Foundation^[63] each saw library automation as a valuable tool for bringing the libraries of those countries into support of modern social and economic development. They each began their funding of such developments.

During this period, publishing continued essentially unchanged, though with steadily increasing concern about how best to deal with the impact of electronic formats (which, as will be seen, became virtually a crisis situation in the next period).

During this 1975–1990 period in the United States, funding problems for both public and academic libraries were real and in some cases catastrophic. University libraries experienced 10–20% budget reductions each year for 5 years and more. But the prices of materials sky-rocketed; journals, in particular, escalated in cost at 15–20% per year during this period. Yet, in the face of the economic travails, the use of both public and academic libraries grew dramatically. The information economy requires the kinds of resources and means for information access that libraries and only libraries provide.

Information Technology Context

During the first 30 years or so of this history, the decisions concerning computer acquisition, as said above, were based largely on Grosch's Law: Bigger is better! But something happened toward the end of the 1970s that was a fundamental revolution. The microcomputer—the PC and the Apple Computer Macintosh—totally reversed the law: Smaller is better! The new law was “Moore's law” (named after Dr. Gordon Moore, cofounder of Intel) which states that the capabilities of microprocessors double every 2 years.^[64] The result is that today, one can hold in the palm of the hand more computing power than even the largest of main frames of two decades ago. The result has been a distribution of computing power that puts the PC, laptop, or palmtop in the plane seat, the police car, the

fire engine, the personal auto, as well as in virtually every home and office.

The revolution in information technology is far greater than just the computer itself, though it indeed is the centerpiece. Increases in telecommunication capacity in some respects equal those in computer capacity. Whereas 50 years ago, we were limited to 10 characters per second (roughly the equivalent of 100 baud), today we have data rates 10,000 times greater for use in our own homes. Whereas 40 years ago we had CRTs with minimal capability, today we have displays with resolutions virtually the equivalent of the printed page and screen capacities that permit the most beautiful images imaginable and the ability to observe in real time the operation of the heart or the brain of a human being, in living color no less. Whereas 50 years ago we were happy to have 6000 bytes of internal memory, today we can have almost unlimited numbers of megabytes. And whereas 30 years ago the means for mass storage of data were limited in capacity and unbelievably slow, today we have gigabytes of capacity with rapid random access.

What a revolution it has been!

Library Technical Services Context

During this time period, the bits and pieces that were created by individual institutions were replaced by integrated library systems (i.e., systems including the full range of functions in both technical services and reader services), commercially available and with the support of highly qualified professional staffs. They were operational on both main frames and personal computers; they functioned in both stand-alone and "client-server" modes; they served every type and size of library; they functioned well in any country of the world.

The NOTIS and DOBIS/LIBIS systems were the first of the products of this kind, but during the 1975–1990 period, the number of integrated library systems steadily grew. An inventory of them for each year since the early 1980s is available online at Integrated Library Systems Report.^[65] These commercial systems differ in their means for software implementation, in the hardware they will use, in the services they will provide, in their pricing. But, in essence, they each provide essentially the same coverage of the technical services operations.

Information Services Context

The effects on information services during this period were dramatic. The availability of OPACs in virtually every library made the resources of the library and, in most cases, of the world readily available. The availability of CD-ROMs brought a wealth of materials into the library, not only available but in processable form. The Internet and the World Wide Web began to provide means

for online communication and access that would change the entire information economy.

COMPUTERS AS INTEGRAL TO LIBRARIES: 1990–2008

Societal Context

And this also was a most remarkable period! In the United States, the continued progress in development of the Internet led the Clinton administration to identify the need for a national and then international "global information infrastructure." For the first time, "information" beyond simply science information had explicitly become an identified priority in national policy.^[66,67]

This period has seen a virtual revolution in the extent to which information resources are used throughout the U.S. society. Today, massive amounts of data are generated, transmitted, and consumed. The cellular telephone is ubiquitous. The Internet is growing in use at a phenomenal rate—doubling in use every 3–6 months! The entertainment and amusement industries are exploding. The publishing of books and magazines has grown similarly. Indeed, the "super bookstores" proliferate at an almost unbelievable frequency, and one of the success stories of the Internet was "amazon.com" as an online bookstore.

During this period, there was almost a revolution in publishing. As a result of the transfer of advertising budgets to the Internet, newspapers found themselves in serious financial difficulties.^[68] Journals increasingly moved into electronic distribution. Even electronic books began to appear, although print continued to be the overwhelming means for distribution of books.

The spectacular growth off the Internet during this period did lead to the "dot-com mania" of the mid-1990s which came to a resounding crash in March 2000. The investment frenzy created billionaires, literally over night, and the crash then wiped out many of them. In the 8 years since then, though, the Internet as an investment vehicle has essentially recovered. Google went public in 2004 and since then has sky-rocketed. And the shares of other Internet companies have also done well.^[69]

One other societal event needs to be included here, since it has had dramatic and devastating effects upon libraries. The catastrophe of the September 11, 2001 attacks, the ensuing wars in Afghanistan and Iraq, the continuing and growing tension in the Middle East, all have led to the diversion of federal funds from domestic needs to military needs. The resulting deficits have cascaded into state and local economies, with one result being that funding for libraries, both public and academic, has been significantly curtailed. And there appears to be no end in sight.

Information Technology Context

During this period, the information technologies continued to develop based on Moore's law. The capacities and speeds continue to double yet the costs stay the same or even decrease.

One development that could have significant impact on publishing, book distribution, and libraries is "print on demand," in which material is printed and bound at the time of delivery to the purchaser.^[70-72] The value for the publisher and for book distribution is that large inventories are not needed, so storage costs, handling costs, and accounting costs are eliminated, and there is no loss from unsold copies. The value for the library is instant delivery.

Library Technical Services Context

The commercial integrated library systems continued to be the basis for library automation, essentially little changed from those developed and marketed during the prior period. The major impact of automation of libraries, though, was on the print journals, which are rapidly disappearing, and replacement of them by electronic access, via the Internet.

During this period, the fact that services provided by WLN, OCLC, and RLIN were duplicative, without any essential differences, led to OCLC becoming the surviving agency. The merger of WLN into OCLC occurred in 1998-1999;^[73,74] that of RLIN into OCLC, in 2006.^[75] The result is the effective realization of a union catalog for the United States as envisioned by Charles Jewett over 150 years ago.

Major research libraries began participating in joint efforts to digitize their collections of materials no longer in copyright.^[76]

Information Services Context

The impact of the Internet search engines, Google especially, on information services was immense during this period. The first of the tools underlying the search engines, called Archie, appeared in 1990. It was followed by Gopher, Veronica, and Jughead, in 1991. They searched in file names and menus, but not in content. WebCrawler and Lycos, in 1994, were the first to provide for content searches. And then the number of content search engines exploded.^[77] There were, as of April 24, 2008 over 130 organizations providing these generic Internet services.^[78] Table 1 shows just a sample of the range of search engines now available, sequenced by date of their initiation and showing an Internet source for each date.

The database services continued but now as part of the Internet. A listing of database services providers includes 87 organizations. It is of more than passing interest to note the extent to which these organizations are now not based in the United States. This surely reflects the extent to which the information economy has become a global phenomenon. Just as an example, Dialog was acquired by Knight-Ridder in 1995; then, in 1997, Knight-Ridder merged with Marketing Analysis and Information Database and the new corporation became The Dialog Corporation; in 2000, the Thomson Corporation acquired the database service operations from The Dialog Corporation; in 2008, Thomson and Reuters merged.^[79] In much the same vein, Wolter Kluwer, a Netherlands based company acquired Ovid in 1998^[80] and then Silver Platter in 2001.^[81] Beyond the Internet commercial search services and database access services, academic and public libraries throughout the United States developed Internet "online reference desks" and library-based research guides

Table 1 A sample of currently available search engines.

for specific subject areas. The University of Illinois “online reference collection”^[82] and the Internet Public Library (maintained by a consortium of information science academic programs)^[83] are two specific examples, but there is a broad range of other libraries using a variety of software tools.^[84]

THE FUTURE FOR COMPUTERS IN LIBRARIES: POST-2008

It is the year 2008, at the time of writing this. It is very difficult to make predictions, especially about the future, but the discussion of this sixth and last time period is about the coming years rather than past years.

Societal Context

The revolution that has resulted in the “information economy” will continue, and the pace will accelerate in other countries of the world as well as in the United States. The facts are that information products and services have become a world-wide phenomenon. It has been estimated that it is a trillion dollar market, and the United States today is the dominating supplier. The Internet is the means for access as well as a manifestation of the information economy.

What is the future of publishing, especially in the light of what is happening with the information technologies? In particular, what will happen to publication in print formats? While there is clear evidence for a shift in journal publication from printed issues to on-demand publication of articles, there is no evidence of comparable shift of monograph publication in the same way. Therefore, for libraries, it is necessary to plan for continued acquisition of book materials in print form. See, for example: “. . . experts predict that elementary and high school textbook sales will jump by 35%, to \$3.5 billion, from 1996 through 2001. College textbook sales are expected to zoom 40%, to \$3.47 billion, over the same span.”^[85]

Digitized imaging is a form of publication that will be of increasing importance. It has become a powerful tool in research of all kinds. It is the basis for publishing of materials such as maps and will probably replace print as the means for publication of them. Academic libraries, especially, should plan not only for management of digitized images but for serving as significant sources for publication of them.

So, what will happen to libraries? There are persons who forecast their demise, in the perception that they will be replaced by the wealth of resources becoming available through the information technologies; such voices have been heard for at least the past three to four decades. It is a fact that during the past decade libraries have faced enormous economic pressures; they have had to operate within the constraints of reduced budgets even while the

costs of acquisitions—especially of journals—have been escalating at exponential rates of 15–20% per annum. At the same time, they have needed to make continuing investments in automated systems and to deal with the array of computer-based forms of publication.

The likely picture, though, is very different from that of those who wish to get rid of libraries. Libraries are essential and will continue to be so in the foreseeable future. Instead of being overwhelmed by technologies, they have absorbed them, made them economic and effective, and served as the basis for testing and proving them. It is also a fact that the effect of electronic information resources was to increase not decrease the use of the library. The various forms of publication are complementary and mutually supportive rather than being substitutes for each other. The use of any of them leads to increased use of the others, and the library serves as the agency for access to all of them.

There is every expectation that the library will continue not only to exist but to thrive and to play its historic leadership role in the coming decades. Underlying that expectation is the view that, while electronic publication will be increasingly important, it will not replace print in the foreseeable future. And libraries will be the means of access to both print and electronic formats.

Information Technology Context

During the more than 60 years the computer business has continued to grow at a phenomenal rate. Each year the capabilities have increased, the effectiveness and even efficiency have increased, the pervasiveness in our society has increased.

Of that more than 60 year history, though, the most spectacular gains have been made within the past 30 when “microprocessors”—computers on chips—became the basis for the hardware. The first microprocessors were breathtaking innovations and they revolutionized not only the design of computers but their use throughout our world.

Will the process continue? In a recent book,^[86] Michael Malone poses that question and concludes that the answer is Yes, saying that, while there are absolute barriers in the laws of physics, there are still means by which the process can continue. Most important among them are those that relate to the software, in which future developments may have even greater impact than we have seen to date from the hardware.

Library Technical Services Context

The integrated library systems operational and commercially available today surely meet the needs in technical services. They are well proven and there is now extensive experience in their use.

Having said that, the role of technical services themselves in libraries for the coming future is problematic. Acquisition of journals is now a matter of negotiation with the publishers and consolidators, in which large numbers of electronic journals are dealt with as a package. Processing becomes nonexistent for those journals, since they are available, under the negotiated arrangements, directly online from the publisher or consolidator. Acquisition of books and special collections, on the other hand, is likely to continue if, as predicted above, printing continues to be the primary means for book distribution. Even given that, one can visualize the library with the equipment and online access necessary to use print on demand. The impact on technical processing in such cases could be profound.

With respect to cataloging, the situation already has had a significant impact. Increasingly, the national bibliographic database maintained by OCLC serves not only as the source for cataloging data but as the OPAC. Here the effect on technical processing is even greater.

Information Services Context

The implications are that library services to patrons will become increasingly important and that staff will be shifted from internal operations to direct services.

First among the direct information services is the Internet. Indeed, the pace in growth of the use of the Internet is likely to continue on into the future, though with likelihood of significant slowing in perhaps 5 years. Access to the Internet will continue to be important for academic roles. It is important to note, however, that while the Internet was highly academic in its origins and orientation, those uses, while growing, will do so at a substantially more limited rate and are already very small in comparison to the commercial uses.

The crucial point is that the widening scope of information resources increases the importance of the information services. In this respect, it is important to recognize that the library is more than simply a collection of materials, valuable though that is and will continue to be. It is also more than simply a means for access to those materials and the information contained in them, again valuable though that is and will continue to be. The library is the agency that serves as the means for selection. It does so when acquisition librarians make decisions about what materials are worth adding to the collection. It does so when reference librarians help patrons in locating and selecting from the wealth of resources those that will meet needs. It does so when library-based information specialists select from retrieved information and analyze the results.

The library is also a means for users to learn how to manage information resources. Library services in teaching are therefore of special significance, and the increasing wealth of resources adds greatly to their importance.

Library Consortia in Europe

Tommaso Giordano

Library, European University Institute, Florence, Italy

Abstract

In the professional literature the term “consortium” covers a great diversity of cooperative situations and experiences according to the different contexts and times in which it was developed. In this entry the term “consortium” will accordingly be discussed with its meaning restricted to structured cooperative activities aimed at acquiring and administering electronic information resources in European countries. More exactly, this definition here includes consortium initiatives in which the main program is focused on activities related to the purchasing of electronic licenses (academic journals, databases, etc.) and handling access to, and archiving of, the collections acquired. Recently library consortium initiatives have shown increasing attention to new issues of major interest for future developments: among these, long-term preservation of electronic resources (including noncommercial publications and institutional repositories), digitalization programs, acquisition of backfiles, etc. Regarding types of libraries, it should be kept in mind that the development of consortia for electronic resource sharing has so far spread chiefly among university libraries, and research and higher education communities. There are also some cases of direct, active involvement of national libraries. One can, however, note almost everywhere the growing involvement of public libraries in consortial activities. This entry focuses on the territory that forms the European Union (currently 27 countries) and some countries which, while not officially a part of this organization, are found within its geopolitical area. The countries of the former Soviet Union have not been included in this study.

INTRODUCTION

In the professional literature the term “consortium” covers a great diversity of cooperative situations and experiences according to the different contexts and times in which it was developed. The ideals and practice of library cooperation were progressively affirmed during the last century, giving rise to a considerable variety of activities and organizational forms with various names, often related to the most fashionable cultural trends or suggested by new technologies and innovative models developed in business contexts. This explains the popularity in the past of such terms as system or network, used to refer to cooperation initiatives in the library sphere. Clearly, these terms denote fairly precise concepts, and were in most cases used to focus attention on organizational models, technologies, and services set at the center of a particular cooperation initiative.

Use of the term “consortium” became established in the North American library lexicon in the 1960s^[1] and indicates forms of structured cooperation focused primarily on resource sharing and cost reduction. In some European countries use of the term in library contexts has very remote origins. In Italy, for instance, the word “consorzio” has, with changing fortunes, been used in the area of public libraries throughout the twentieth century. The “Consorzio delle biblioteche popolari milanesi” set up in Milan in 1903^[2] under the impetus of the social reform

movements of the times in order to promote literacy among the working classes is probably one of the oldest cooperation experiments to use this term in a library context.

In some European languages consortium has a fairly precise meaning in legal terms: it indicates a union of people, of public and private institutions (in Italian) or union of banks (in German),^[3] with a specific legal structure. The reference to specific legal structures means that in Europe the word consortium takes on different meanings in different countries, engendering some misunderstandings in professional communication. With some approximation, we may say that the difference in use of the word among European librarians chiefly concerns the differing extent of legal formalization of the assemblage called a consortium.

However, more recently, under the influence of Anglo-American experience, the word consortium has tended to take on a broader meaning, no longer linked with particular legal formulas. It is, however, clear that the favor the term has met with on the international librarianship scene in the last 15 years is chiefly associated with its use in the area of cooperation initiatives pertaining to the acquisition and management of electronic information resources (i.e., e-journal collections, data bases, and full text access services). Indeed, currently in the language of European librarians the word consortium chiefly indicates cooperation initiatives born under the impulse of the “academic

journals crisis” (a term indicating the continuing rise in subscription prices that is particularly impacting the university and research sector), and the greater availability of collections and publications in electronic format.^[4,5] In this area, too, most consortia are actively engaged in or support broader-range actions, such as the search for alternative models of academic communication, or the action by library organizations to support nonrestrictive copyright provisions. Use of the term “consortium” in the sense we have here sought to clarify is attested by many conferences on the theme and by articles that have appeared in authoritative specialized journals.^[6,7] See the European ICOLC annual conferences that have taken place regularly since 1999 in various countries. In this entry the term “consortium” will accordingly be discussed with its meaning restricted to structured cooperation activities aimed at acquiring and administering electronic information resources in European countries. More exactly, this definition here includes consortium initiatives in which the main program is focused on activities related to the acquisition of electronic licenses (e-journals, databases, etc.) and handling access to and archiving of the collections acquired. It should be noted that recently library cooperation initiatives have shown increasing attention to new issues of major interest for future developments: among these, long-term preservation of electronic resources (including noncommercial publications and institutional repositories), digitalization programs, and the acquisition of backfiles and important historical collections by commercial publishers.

Regarding types of libraries, it should be kept in mind that the development of consortia for electronic resource sharing has for the above-mentioned reasons so far spread chiefly among university libraries, and research and higher education communities. There are also some cases of direct active involvement by the national libraries. One can, however, note almost everywhere the growing involvement of public libraries in this type of consortial activities. Regarding the contents, we must keep in mind that attention is currently focused on international academic publishing (primarily in the scientific and medical disciplines) which, as is well known, is essentially in English. Publications in the fields of humanities and social sciences in the other, European languages, are seldom available in electronic format. In fact, with the exception of the United Kingdom, publishers in Europe are in general still reluctant to make the transition to e-format, among other reasons due to the limited dimensions of the market in the different linguistic areas.

THE CONTEXT

This entry focuses mainly on the territory that forms the European Union (currently 27 countries) (Initially, the European Union consisted of just six countries: Belgium,

Germany, France, Italy, Luxembourg, and the Netherlands. Denmark, Ireland, and the United Kingdom joined in 1973, Greece in 1981, Spain and Portugal in 1986, Austria, Finland, and Sweden in 1995. In 2004 the biggest-ever enlargement took place with 10 new countries joining: Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia, followed, in 2007, by Bulgaria and Romania.) and some countries which, while not officially a part of this organization, are found within its geopolitical area (Iceland, Norway, Switzerland, Serbia, Bosnia Herzegovina, Albania, and Montenegro and also the EU candidate countries: Croatia, Turkey, and the former Yugoslav Republic of Macedonia.). We are dealing, then, with a territory smaller than the United States but one with a much higher population and one that is characterized by an extreme cultural and linguistic diversity—there are 23 official languages just in the 27 countries of the European Union—as well as by very different socioeconomic situations. The countries of the former Soviet Union have not been included in this study, both because their context is not easily comparable due to the strong political and economic differences that are still evident in Europe and because the available documentation regarding the present topic appears rather scarce. Nevertheless, interesting developments are evident in most of these countries, particularly in Russia, where several initiatives are supported by EU programs (i.e., Russian Information Library Consortium [RILC]),^[8] and by foreign foundations (i.e., National Electronic Information Consortium [NEICON]),^[9] which involve a large number of state and university libraries, public libraries, and research and special libraries.

We cannot, however, allow to pass unobserved an important historic event which took place in Europe at the beginning of this new century: the enlargement of the European Union in 2004 and, subsequently, in 2007 which resulted in 12 new member states scattered throughout an area ranging from the Baltic Sea to the Mediterranean. This peaceful “geopolitical revolution” has enormously enriched the diversity of the cultural heritage of the European Union as well as posed new challenges for the future of the Old Continent. In the current transition phase we should note the effort made by the new member countries to overcome the economic and social gap that divides them from the rest of the European Union and the progress that they have made on various levels, including technological innovation and reform in their educational systems.

In general, we can say that in Europe the level of commitment to electronic resources in the libraries reflects the differing degrees of economic development mentioned above, since to the traditional gap between North and South Europe we now must add the disparity between East and West. In reality, the picture is more complex than it appears at first glance. Observing more carefully the current initiatives in the library field, it appears instead the

case that this simplistic schematization does not always reflect the evidence; examples of advanced consortia for the management of electronic resources are visible in the South as well as the North, and in the East as well as the West, demonstrating once again the differences between different regions of the same country.

The cases of Spain, Italy, and Slovenia are fairly indicative in this regard. In Spain the Catalan consortium^[10] is quite an advanced organization, but is also rather atypical of the general position of libraries in those countries; in Italy, on the other hand, consortium activities are chiefly concentrated in the center and north, confirming the existing gap between these areas and the south of the country.^[11] In Slovenia, however, the development of programs for library cooperation is comparable to the situation of the most advanced European countries.

In fact the degree of progress and modes of implementation of consortium initiatives in the various countries depends on both current investment policies to develop the information society applied by the various countries and numerous factors of a social, historical and cultural nature that have brought the emergence and establishment of library cooperation practices specific to each context. It is clear that in countries where library cooperation is not well rooted, organizing consortium initiatives face a much harder (and especially more uncertain) task than in Britain or other countries of Northern Europe with more deeply rooted traditions in this field of activity.

Looking at the scene of cooperation initiatives in progress, one has the impression that the gap between the different countries has been shrinking in recent years. And indeed over the last 15 years there has been a considerable increase of cooperation in all European countries. Probably, as far as EU territory is concerned, the special programs launched by the European Commission to promote technological cooperation among libraries have not been entirely without influence in creating conditions favorable for this trend.^[12] Over and above the concrete results for which they may have been responsible in terms of services and technological applications, these programs have over the years offered libraries in the various European countries the chance to collaborate on joint projects, promoting the exchange of experience and development of cooperation practice, also among archives and museums. Among the recent noteworthy developments is the *European Digital Library*, a long-term program, wide in scope, which involves national libraries and numerous important libraries, archives, and museums of many countries, in a joint efforts to promote access to Europe's cultural heritage. Another relevant initiative promoted by the European Commission deals with scientific and scholarly communication, aiming to support new approaches and economic models to foster better access to scientific information online (including academic journals) and to preserve research results digitally for future generations.

In addition to these factors, however, a decisive role is played by the policies pursued and administrative mechanisms and structures through which the resulting programs are activated. If, concerning policies for implementing an information society, some similarities of intentions and general objectives can be discerned, not just among EU member countries (which as we know move in concert in this area) but more generally in all European countries, there are instead considerable differences in terms of instruments and operational programs. Regarding the latter aspect, one of the main factors directly influencing library cooperation models is the structure of the political and administrative system in the individual countries. This factor relates to autonomies and the degree of decentralization of the different national models, which vary considerably in Europe. Obviously, the German federal order based on the autonomy of the *Länder*, which have specific powers in the sector of culture, education, and research, presents different opportunities and conditions for cooperation than more centralized systems, such as the French. A somewhat similar system is that of Switzerland, with a specific feature represented by the official languages of the various cantons on which the federal organization is based. In the case of Spain, founded on administrative devolution to the regions (*comunidades autónomas*), practical aspects of library cooperation (e.g., funding) are more reminiscent of Germany than of Italy, even though the system is closer to the latter country. Without dwelling further on this point, we may take it for granted that the political and administrative system has no little influence on the levels (and aims) of cooperation, and that developing a national consortium in Belgium—where the institutional pattern is based on representation of the two communities (French and Flemish)—is a much more complex matter than in France or United Kingdom, despite their greater size.

OVERVIEW

To provide an overview of the picture, we shall take a quick, panoramic look, moving from West to East, at the consortium experiences that in our view best represent the problems associated with the current stage of development of these initiatives. Thereafter we shall analyze and compare some components of consortium organization, with an eye to identifying features common to the various experiences.

The Nordic countries—Finland, Sweden, Norway, Iceland, and Denmark—represent one of the areas where library cooperation practice is most widespread. With common historical backgrounds and cultural roots (with the exception of Finnish, all the languages spoken in the area are from the same linguistic family), the five countries maintain solid collaboration relationships and have developed major library cooperation programs, some of which also gather together the Baltic countries. Among

these the Nordic Council for Scientific Information (NORDINFO), closed in 2004, developed a broad range of projects and activities for 30 yr. One of the larger cooperation programs in the region is Northern/Baltic Union Catalogue of Serials (NOSP), in which 1300 libraries from Denmark, Iceland, Sweden, Finland, Estonia, Latvia, Lithuania, the Faroe Islands, and Norway, take part. This solid basis for common work and mutual exchange does not prevent the individual countries from displaying their own peculiarities in the development of consortium models. One common feature of the Nordic experience is the role that the national libraries play in organizing cooperation and the various degrees of centralization in solutions adopted. Among these consortia FINELIB, based at the Finnish National Library, is a model with a high degree of centralization but also a high level of participation in decisions, ensured by a fairly elaborate structure of governing bodies. This consortium currently comprises over 100 university, research, and public libraries. FINELIB's programs include the negotiation of electronic licenses and other activities in the sphere of electronic resources sharing. Among these should be mentioned the project NELLI, a national portal for access to licensed resources management based on a common user interface.^[13]

In Sweden, the main consortium initiative has been pursued by BIBSAM, the department of the Royal Library that coordinates cooperation and development activities at national level.^[14] BIBSAM carries out various programs of activities to support the Swedish university and research library network, underpinned by central funding. It also has a fund to support access by libraries to electronic resources. Though not a consortium, BIBSAM acts like one, and in recent years has negotiated many agreements with publishers and suppliers of electronic information on behalf of libraries, and supported the implementation of this program both financially and technically.

In Norway, a wide range of cooperation programs have been developed by BIBSYS, the major academic library network. Most of the consortium initiatives for electronic resource sharing are handled by the ABM, the Norwegian Archive, Library and Museum Authority, which negotiates licenses at a national level.^[15]

In Denmark, consortium agreements were initially handled directly by the university libraries; subsequently, some agreements with major scientific publishers were amended into national agreements with support from the Denmark Electronic Research Library Project (DEF), a major cooperation program supported by the National Library Authority, which embraces a wide range of projects and activities, including creation of a high-speed network connecting the largest university libraries, the central purchase automated library systems, the digitization of relevant collections, license management, and portals.^[16]

In Iceland, the cooperation programs are handled by Landskerfi bókasafna (the Iceland Library Consortium);^[17] regarding e-licenses, agreements have been

reached with a major supplier of electronic services by the Steering Committee on Access to Electronic Material, the consortium organization supported by the National and University Library of Iceland in Reykjavik.

On the European scene, Great Britain is regarded as the most advanced model in terms of innovation in library services and development of advanced forms of cooperation. Helped by a language which is by now almost universally known, experience from that country is often regarded as a reference point. Established practice in the area of cooperation and the activism of relevant bodies at the national level are yielding good results in the digital age too. On the other hand, we must keep in mind that there is a strong position of autonomy among both universities and territorial units, resulting in a path to cooperation that seeks to balance the various requirements of coordination and decentralization. Consortium initiatives in Britain are numerous at both the national and the regional level and in all library sectors. In the university research library sector, one of the most well-established consortia is Consortium of University Research Libraries (CURL) (Research libraries in the British Isles) which provides a wide range of projects and activities involving a large number of research and academic institutions. The main organization operating in the field we are considering, however, is Joint Information System Committee (JISC),^[18] set up to promote the development of electronic information in U.K. universities. JISC supports many projects concerned with education and research based on information technologies, and has set up synergies and alliances with various organizations operating in the information sector. Among projects launched by JISC, we should mention JANET, the United Kingdom's education and research network; and NESLI2, which follow the original National Electronic Site License Initiative (NELSI),^[19] founded in 1995, the consortium regarded as one of the main reference models beyond the United Kingdom as well. This consortium's operational structure is in the hands of two external bodies: the "managing agent"—a private company with the task of handling negotiations of electronic licenses—and a computer center in Manchester which provides technical support. A Journal Working Group membership provides advice and support on developing priorities and license negotiations according to the JISC collection strategy. JISC supports a wide range of initiatives in the academic information domain, among them cooperation projects on digital repositories (i.e., SHERPA) and the long-term preservation of digital publications.

In Ireland, on the other hand, consortium initiatives in the field of electronic resources, mainly between university libraries, are informal in character. Of these, the consortium for the acquisition of electronic periodicals, under the supervision of the Conference of Heads of Irish Universities (CHIU), involves most higher education institutions in the country.^[20]

In Germany, as we already mentioned, the federal structure determines that cooperation is principally at Länder level, but there are also national programs funded by the Deutsche Forschungsgemeinschaft (the German National Research Council). Since the 1970s, various cooperation programs have been developed (some of them bringing several Länder together) to create union catalogs. Activities associated with acquiring electronic resources have given rise to a variety of cooperation forms. Only the Friedrich Althoff Consortium in Berlin-Brandenburg has the legal status enabling it to act as a corporate nonprofit body. In the other Länder, consortia “are represented by an individual library (e.g., Baden Württemberg) or a central institution such as the Bayerische Staatsbibliothek, or the Hochschulbibliothekszentrum NRW in North Rhine-Westphalia.”^[21] Ways of funding consortia also differ considerably, even if the main sources are the Länder governments within whose jurisdiction, as we have said, the libraries fall. In some cases the consortia are funded directly by participating libraries, but in the majority of cases they receive substantial subventions supplied by the Länder. There is an emerging need for programs to bring all the Länder together into a national strategy; since 2004 considerable attention has been focused on negotiating national licenses of important digital collections.^[22] Further, there is a significant initiative by the leaders of the German consortia, who in 2000 founded an association subsequently joined also by the consortia from Austria (where a cooperation scheme at the national level has been developed as well, Konsortien in Österreich) and Switzerland: this body, German, Austrian and Swiss Consortia Organization (GASCO), is intended to develop joint strategies for acquiring and handling publications, creating the conditions for activating action plans at the supranational level.^[23]

The tendency to converge toward a national strategy, or at least to create synergies with programs and instruments operating in different sectors, is emerging with various patterns and orientations in many countries in Central Europe. This is the case of the Dutch consortium—the UKB Association—in which 13 university libraries participate along with the Royal Library and the Library of the Royal Dutch Academy of Science.^[24] UKB is supported by contributions from the participating libraries. Its activities are focused chiefly on negotiating electronic licenses with major publishing groups, with which it has reached numerous agreements. The UKB Association in recent years has enlarged its objectives and strategies within a broader vision including academic publishing output of the learned societies and digital repositories. These developments take advantage of a strong tradition in library cooperation, in which important programs like PICA, a library network very active in central Europe and now comprised in OCLC, have matured.

One interesting national library cooperation program has been developed in Switzerland, despite the intrinsic difficulty of achieving an objective of this type in a

country structured in 26 states (cantons and sub-cantons) where three language communities (German, French, and Italian) coexist. The first consortium aggregates emerged at the local level, since the universities are financed by the cantons. Subsequently, in 1988, thanks to the commitment of the conference of university rectors, the Consortium of Swiss Academic Libraries (Konsortium der Schweizer Hochschulbibliotheken), partially funded by the federal government, was established. At present the consortium (with about 50 libraries, including the Swiss National Library), in addition to the acquisition of electronic licenses, is developing into other sectors, among which is a project for electronic archiving. The consortium’s organizational structure—which also provides for potential members from among public and research libraries—is based on a central office and a fairly elaborate governing structure, at the top of which is the conference of university rectors.^[25]

The linguistic and cultural barriers and the complications due to the political administrative system have to date still not been overcome in Belgium, where the libraries of the French and Flemish language communities organize separate consortium initiatives. The consortium program of the universities and research institutes of the Flemish area come under the Vlaams Overlegorgaan inzake Wetenschappelijk Bibliotheekwerk—WOWB (Flemish Research Libraries Council)^[26]—and the Flemish Ministry of Education, which supports the e-resource acquisition project Elektron.

The e-resource-sharing initiative of Francophone university libraries come under a nonprofit body, the BICfB: la Bibliothèque Interuniversitaire de la Communauté Française de Belgique, established in 2000 under the auspices of the country’s conference of Francophone university rectors.^[27]

At the end of the 1990s various consortia programs were developed at the local level in France. A major example is COUPERIN, a consortium initially promoted by a group of six university libraries, including Strasbourg University Library. This initiative had a noteworthy success and, thanks also to the support of the presidents of the universities, has expanded rapidly to become national in its dimensions. In 2007, COUPERIN had 212 members among university, higher education, and research libraries. Supported by the group of universities that provided the resources in the initial stage of development, today COUPERIN enjoys ad hoc support from the French Ministry of Education. The success scored in the license negotiating sector is forcing this consortium to broaden its mission and its programs and to integrate its digital collection development and management policy within the framework of a national strategy. To meet these new challenges, COUPERIN recently reinforced its structures and established collaborations and alliances with other consortia and agencies, including ABES, the major library network of the country.^[28]

Consortium experience under way in the countries of southern Europe is highly diverse, even in more culturally homogeneous areas where Romance languages are spoken. In the Iberian Peninsula, much of consortium activity aimed at electronic resource sharing started with the new Millennium, though since the 1980s Portugal and Spain have secured remarkable growth of library services and also a considerable development of cooperation activities. The turning point in Spanish interlibrary cooperation came in 1996 with the creation of the consortium of university libraries of Catalonia CBC (Consorti de Biblioteques Universitaries de Catalunya), later followed by other initiatives in Galicia (Bugalicia), the Madrid region (Madroño) and Andalusia (CBLA). On the basis of the regional decentralization typical of the Spanish system, the consortia are financed by the universities and/or the local government (*comunidades autónomas*) to which they belong. Consortium activities concern acquisition of electronic resources and, in the case of Galicia and Catalonia, also the development of other bibliographical utilities.^[29,30] The Catalan consortium represents one of the most advanced model in South Europe: it is a legal entity with solid institutional ties (the National Library of Catalonia is also a member), supported by a funding mechanism based on the contribution of the local government and equipped with dedicated infrastructures and staff. Thanks to the common technological platform used by participating libraries (the consortium was born as a library automation network), this organization shows great potential in terms of integration of resources and development of value-added services.^[31]

In 2004, a national consortium has been established in Portugal with the support of the government. The program is called B-ON: Biblioteca do Conhecimento Online (Library of Knowledge Online). This initiative includes 50 participants—universities and research libraries—and provides access to several important e-journal collections which should expand significantly during the current year.^[32]

In Italy initiatives to share electronic resources began to appear only in the late 1990s and are currently located chiefly in the center and north of the country. Of the three most important consortium activities, two are led by university computing consortia—CILEA in Milan and CASPUR in Rome—nonprofit organizations that supply computing services and, in the electronic information sector, act as intermediaries on behalf of the associated libraries. The third, Interuniversity Cooperation on Electronic Journals (CIPE), in the center and north, includes important universities, such as Padua, Bologna, Florence, and Pisa.^[33] In Italy for a long time there was no real national strategy in the area of electronic information, though the three consortia mentioned come together in Italian National Forum on Electronic Information Resources (INFER)^[34] a voluntary inter-

consortium forum that also undertakes awareness activity to develop cooperation in the area of access to digital information. Since 2007 a more consistent national approach has begun in the form of CARE, an interconsortium program established by the Conference of Italian University Rectors (CRUI).^[35]

A country which differs in a number of ways, in terms of both historical experience and geographical location, from the Mediterranean European countries we have just covered—though sharing deep cultural roots with them, as well as EU membership—Greece today presents a very interesting experience of library consortia in Europe. Born on the initiative of a group of universities, including Thessaloniki, and with the support of European Commission technological library programs, Hellenic Academic Libraries (HEAL) Link currently includes more than 30 institutions of higher education plus the Athens Academy and the National Library. The sphere of activities of this program—which is supported by central government funds—is wider than the electronic licensing negotiation, including also other projects ranging from production of the union catalog to operational standards and staff training.^[36]

In the transition phase toward a free market economy and a democratic government that characterizes their recent history, the countries of Central and Eastern Europe have made a considerable effort to reach the development of the West and to align their legislation with EU standards. In this context we can note the reforms realized in the field of library legislation and copyright and the current investments for a more extensive use of technology in the management of information—a fundamental condition today to develop the sharing of library resources. In this process (one not always free of obstacles) the countries of Eastern Europe have been able to rely on the support and encouragement of various governments and international organizations such as the Council of Europe, and above all specific programs designed by the European Union and by public and private nonprofit organizations. Regarding the development of the consortia in particular we should note the action carried out by the European Union through various programs including TEMPUS and the programs undertaken by the Open Society Institute (OSI), a branch of the Soros Foundations. Among the EU programs deserving of particular mention we should include Central and East European Licensing Information Platform (CELIP),^[30] supported by the European Union and developed by European Bureau of Library, Documentation and Information Associations (EBLIDA),^[37] an organization for the library associations of different European countries with the aim of raising awareness of the issues regarding copyright and the management of electronic licenses. The action of the Soros Foundations, carried out through eIFLnet (Electronic Information for Libraries) has been on a larger scale and more systematic. Created in 1999, eIFL is active in numerous countries throughout Europe, Asia,

and Africa; its principle aim is to provide support and assistance for the access to electronic resources "by library users in transition and developing countries."^[38] Its activity is concentrated on the organization of consortia in various countries, and in this context has realized an agreement with important aggregators and publishers for access to the collection of electronic periodicals made available by this provider. eIFL has been particularly active in the countries of Central and Eastern Europe, in the Balkans, and in the countries of the ex-Soviet Union, where thanks to this program access has been made available to the electronic resources in many university institutes in countries with economic difficulties; in several cases it has been possible to give considerable aid for the development of national consortia in the formative stages.

The Baltic countries in the last few years have made important progress in the field of library cooperation and automation. We should note that the three principal consortia founded in these countries have a legal basis and a relatively solid organizational structure. Perhaps also due to their limited geographical dimensions the Baltic countries have been able to work more easily toward a larger picture of national cooperation. Among these countries Estonia appears the most advanced from a technological point of view, as the data on the use of the internet and the availability of personal computers in the homes demonstrate. The activities of library cooperation based on the use of IT in Estonia refer mainly to the ELINET network,^[39] which also includes a task force that collaborates with eIFL on programs for the acquisition of electronic licenses.

In Latvia, the cooperation activities on a national level are mainly concentrated in a central agency, Culture Information Systems (Kultūras informācijas sistēmas),^[40] which also oversees the acquisition of electronic resources in collaboration with eIFL.

In Lithuania, too, eIFL collaborates with the principal national consortium (recently formed) for the acquisition of electronic resources, Lithuanian Research Library Consortium (LIMBA),^[41] which began operating in 2001.

Poland, on the other hand—the largest in size and population among the ten most recent states to enter the European Union—does not have a strong tradition of library cooperation. Nevertheless, in line with recent trends in IT, a greater vitality is visible in this area as well, and several programs have arisen both in the cataloging sector (e.g., NUKAT, the central catalog of academic libraries, located at Warsaw University and of which 58 libraries are members) and in hardware/software acquisitions and electronic publishing. In the latter field we should mention the development of several consortia, such as the Poznan Foundation of Scientific Libraries, the Consortium of Wrocław Libraries, and the Górnolaskie Consortium of University Libraries. The Poznan Foundation—the only Polish consortium to have a legal basis—was founded in 1996 and includes today ten universities and two public libraries.

The Foundation, initially oriented toward the acquisition and management of library automation systems, since 1999 has overseen the eIFL project on the national level, specifically the acquisition of electronic resources; in addition, since 2001 it has participated in the Digital Library of Wielkopolska project, which provides access to the oldest Polish works held by different libraries.^[42]

Launched in the early 1990s (i.e., before the division of Czechoslovakia) the Czech and Slovak Library Information Network (CASLIN), has been^[36] split into different library networks in the two countries, according to the new political situation. In the Czech Republic, the main program for electronic resources named Uniform Information Gateway (UIG),^[43] currently attracts the largest number of libraries and provides simultaneous searching in different local and international bibliographic resources and full text information.

In Slovakia, too, access to electronic resources is provided by several different initiatives, among which the most important is LIBNET,^[44] the consortium, managed by the National Library, realized in the context of eIFL.

Library cooperation in Hungary takes place in the environment of three main networks: Mokka (The Hungarian Shared Catalogue); VOCAL (Cooperative Cataloguing Program) and KozelKat (Common Electronic Catalogue). Electronic resources sharing initiatives are being carried out by the Hungarian Electronic Information Service (EISZ) a national electronic service consortium sponsored by the Ministry of Education.^[45]

Slovenia can boast of a consolidated practice of interlibrary cooperation at the national level, the principal infrastructure of which is the national library network Co-operative Online Bibliographic System and Services (COBISS) which counts 240 libraries as members. Cooperation for acquisition and the management of electronic resources has been developed principally by Consortium of Slovenian Electronic Collections (COSEC),^[46] with 210 libraries of various types as participants. Founded in 2003 in the context of the eIFL program, the consortium has developed as a program of the National and University Library, and has acquired several electronic licenses. In Croatia the principal cooperation initiatives in the field of electronic resources have as their reference point the Croatian Academic Research Network (CARNET)^[47] university network and the eIFL program. Founded with the principal aim of providing support for the implementation of IT in libraries, CARNET has acquired the licenses of several important data bases, primarily in the scientific and medical fields. In addition to the programs for the acquisition of electronic collections, we should mention the formation of various buying clubs for specific disciplines.

In spite of the dramatic events that have shaken this region, a certain amount of activity is visible in the field of shared management of electronic collections in almost all the countries of ex-Yugoslavia, above all due to the

initiatives supported by eIFL, which is quite involved in this area. There are several consortia currently operational or in the set-up phase in Bosnia and Herzegovina, Kosovo, Albania, and Macedonia. In Serbia, KOBSON (Serbian Library Consortium for Coordinated Acquisition)^[48] at the National Library in Belgrade has operated since the end of the war.

In Romania, the relevant activity in the field of electronic resources sharing (which involves a number of university, research, and public libraries) has its main reference in the Biblioteca Centrale Universitara in Bucharest.^[49] In Bulgaria, several initiatives have arisen in the domain of electronic resources, among which primarily Bulgarian Information Consortium (BIC),^[50] a consortium with a legal basis supported by eIFL.

Turkey, on the other hand, has demonstrated significant capacity and initiative; since 2000, Anatolian University Library Consortium (ANKOS)^[51] has been operational. It is a program at the national level which has rapidly gathered together 40 universities and research institutions, quite a large number considering that Turkish higher education consists of 49 state and 20 private universities. ANKOS is an open consortium to which one may adhere by subscribing to at least one of the current license contracts. Currently ANKOS provides access to a number of important collections of periodicals and data bases. Contracting and shared management of electronic licenses is the central aim of ANKOS, which is administered by a steering committee and secretariat located at the Middle West Technical University of Ankara.

CONCLUSION

After this rapid excursus through the most significant consortium experiences in the various European countries, we can briefly turn our attention to the main trends under way, and draw a few conclusions.

Currently, cooperative resource-sharing initiatives are concentrated in the area of university libraries, even though there is a slowly strengthening trend to involve other types of libraries as well. Many consortia are focusing their attention on negotiating electronic licenses, while other initiatives, chiefly in Northern Europe, are aimed at broader objectives and seek to integrate electronic resource-sharing activities into broader-scope national programs; in several cases (e.g., the Nordic and Baltic countries and some Eastern countries) national libraries and other central agencies are coming to play an important role.

In organizational terms, it should in the first place be noted that the bulk of the consortia operating in European countries have no real legal basis, and have structures that might be called "light." Frequently they are supported by a logistical structure provided by one of the partners, or else make use of an existing central structure (an example here

being the model of the Nordic countries). In other cases the services are outsourced (e.g., the NESLI model). On the other hand, the governing systems of these bodies seem fairly developed and often complex, although they still do not dispel the impression of being rather fragile and transitional structures.

The majority of the consortia can rely on substantial ad hoc government funds, or else receive incentives and logistical support from central bodies, whereas cases of entirely self-financed activities are fairly limited. The availability of central funds is certainly a determining factor for the success of a consortium; at least as much as the administrative political system in which the consortium is set in terms of dimension and strategies.

As regards objectives, a growing concern of most consortia is to extend their sphere of activities to cover other functions including portals and common user interfaces, archiving and repositories. One practically universal need is to move the initiatives toward a national strategy, in some cases including even a transnational dimension.

Among the programs that operate in this perspective eIFL—already mentioned above—is the one which can count the greatest quantity of means and partners. On a smaller scale and with more limited objectives there are also several initiatives of a regional character in operation. Among these we have already mentioned German, Austrian and Swiss Consortia Organization (GASCO), the alliance of library consortia of the German language area. Another is Southern European Libraries Link (SELL), which has been founded as an association that primarily carries out activities of monitoring and information exchange at the level of the library consortia of the southern area.^[52] Regarding the exchange of experience, an important instrument of communication has been gradually developing in the last few years: the European meeting of ICOLC (the E-ICOLC Annual Conference), which periodically brings together consortium managers, academics, and operators in the sectors of electronic publishing in order to discuss issues of common interest.

In conclusion, albeit with a considerable variety of strategies and operational modalities, European consortium experiences show a number of affinities and, most recently, convergent approaches. These tendencies are bound to accelerate chiefly in the countries of the European Union in the near future. On the other hand, we must keep in mind that despite the differences that may exist, the European countries we have referred to in this entry share not just a common heritage of historical events and deeply rooted principles and values but also, as far as the member states of the European Union are concerned, common policies and rules covering a wide range of economic and social matters, associated in a single political project which in the short to medium term will be taking further, decisive steps forward.

Library Fundraising and Development

Susan K. Martin

Lauringer Library, Georgetown University, Washington, District of Columbia, U.S.A.

Abstract

Fundraising and development are activities new to the academic library scene, although as this entry illustrates, certain kinds of charitable giving have existed in universities and public institutions for many decades, if not centuries. Although some of the largest private universities in the United States have endowments that date back two or more centuries, few institutions of higher education have been involved in fund-raising in a serious manner for more than two or three decades. The great fortunes made in the Industrial Revolution enabled the establishment of a culture of philanthropy toward social institutions unknown elsewhere, or at any other time. With the attention of Andrew Carnegie, libraries became the focus of giving for a segment of America's wealthy, although for a number of decades this giving remained relatively restricted to public libraries.

HISTORY OF DEVELOPMENT IN ACADEMIC LIBRARIES

U.S. Phenomenon

Although some significant fund-raising and development programs have been established elsewhere in the world, two factors have caused academic library development to be largely a phenomenon of the United States: most of the early universities in the United States were private, and in this century tax laws have favored charitable giving by private individuals, foundations, and corporations. One of the very early library donors was Thomas Jefferson, who gave his collection to the Library of Congress and also ensured that the University of Virginia was established with a proper library for its role and mission.

A more recent philanthropic gift that made a significant difference not only to its own institution but to academia throughout the nation was the gift of Harry Elkins Widener's collection to Harvard, after the young man became a casualty of the Titanic. His mother, determined that her son would be remembered at least at his alma mater, was persuaded by the Harvard administration that a building carrying her son's name would perpetuate his memory; she would surely be pleased today to know that her son's name continues to be known worldwide wherever there is scholarship.

Private universities and colleges in particular have taken advantage of the human desire for immortality by raising funds from wealthy alumni or friends to build buildings—and few things are more tantalizing than to have “your” building be the one that represents our cultural heritage, the place where all students congregate to meet and study, and where faculty pursue their research.

The History of the Literature

The first edition of the *Encyclopedia of Library and Information Science*, published nearly 30 years ago, reflected the issues of the profession at the time, most naturally. A perusal of the index of the work finds very little reference to the topics that occupy so much of the time of so many academic library directors these days—external funding, the donor base, and gifts of cash, books, or bequests. In the 1960s and 1970s, academic institutions were in a significant period of financial recovery, going from postwar poverty to the riches of the National Defense Education Act and the country's instinctive desire to outthwart the Soviet Union by producing better educated and qualified graduates. The trickledown effect shaped academic libraries, which saw incredible growth for several decades following the war. Massive buildings were constructed; suddenly everyone could have a college degree, and many new universities were created. Money was not an issue, but the effective growth, management, and operation of our libraries were concerns. More than a generation of library administrators grew up with values that reflected a culture of growth and wealth; friends' groups were fine, but they were a frill. Of more concern was the perceived information explosion, which was said to double the size of research libraries every 16 years—a statistic that was unrealistic even at the time and turned out to be without foundation.

Therefore, it is not surprising that in the first edition of this encyclopedia just two articles summarize the extent of coverage of development: William Vernon Jackson's “Funding: Library Endowments in the United States”^[1] and Sarah L. Wallace's “Friends of Libraries”;^[2] both of these articles cover *all* types of libraries. As a result, although Jackson's description of the size and purpose of

endowment funds in academic libraries is fairly extensive, in today's terms, there is little attention paid to the process of *acquiring* these funds (the development process).^[1] Similarly, the discussion of the history of academic library friends' groups is quite helpful, but otherwise, does not touch on operational issues of major concern to university and college libraries of the twenty-first century.^[2]

This limited view of academic library fund-raising is not surprising. The role of the academic library as the "heart of the university" has changed significantly in the past three decades. As the financial constraints on both libraries and universities grew after the 1970s, it became more inevitable that the libraries that were once held apart from the fray of seeking funding outside the university would have to face this new and sometimes unwelcome activity. "The view of the library as a special preserve, protected from the rough-and-tumble of the business world, is fast disappearing."^[3] Two major new functions have been introduced in academic libraries in the past decades—systems/automation and development. In both cases, another unit of the university is considered to be the focus of the specialty, requiring the library to define its plans and policies according to standards set elsewhere in the institution and forcing the library director to take on a role not envisaged by librarians just a generation ago.^[4,5]

Despite the very many changes that have affected our universities and colleges in the past 30 years or so, the character and functions of friends' groups have not changed significantly. What *has* changed is the number of libraries with friends' groups, despite the discussion of the negative aspects of these support groups. In 1990, more than 50% of university libraries had friends' groups, compared to 20% of comprehensive and college libraries and only 5% of community college libraries.^[6] A survey of 196 college libraries one decade later showed that of the friends' groups that existed, half of them had been formed in the 1990s, suggesting that the need for external support had grown sufficiently pressing that even smaller institutions have by now been affected.^[7] Their governance, programs, and missions remain relatively stable.

The areas that have changed most significantly in the past decade have been the establishment of the role of development director for libraries; the intrusion of the institutional capital campaign into the library's way of doing business; and the role of the university or college librarian in development.

The Development of Development

An examination of the progression of activity and sophistication of library development over the past three decades is useful in permitting an understanding of the current activities of academic libraries.

In the 1970s, relatively few libraries engaged in what was at that time typically termed "public relations." As noted above, general social policy and economic well-

being placed libraries in a beneficial financial situation. In these years, prior to double-digit inflation, and with a significant influx of funding, librarians felt as though the world was their oyster. At Harvard, for example, a large portion of the materials budget came from the payout from its large endowments; when inflation began to eat into this payout, the Harvard library administrators were to be shocked to discover that they would need to depend more heavily on university funding, or raise more money, to support the materials budget to which the faculty had become accustomed.

Rather than engaging in the acquisition of external funds, librarians focused on the extent to which they could enlarge their resources (read "collections") by soliciting gifts of excellent collections from private collectors.^[8] However, by the end of the decade, it had become clear that the halcyon days of the 1960s and 1970s were about to disappear and that academic librarians would have to use more ingenuity, as well as external resources, to maintain the kinds of collections and services that their users had come to rely on.^[9] Lynden noted that several of the efforts to obtain outside monies included: appointing staff members whose specific duties were to seek funds from external sources; including the library in the capital campaigns of their parent institutions; turning away from federal funding toward alumni, corporation, or local foundation support; and increasing publicity about the library by printing special annual reports, creating friends of the library newsletters, and developing other annual fund literature.^[9] It should be emphasized that these techniques are described as being novel and unusual means of addressing budgetary problems—only 21 years ago—because they are in such common use today.

The 1980s saw a significant increase in development activity in not-for-profit institutions. Development offices were created, and capital campaigns began to be the single most significant way that universities used to increase their endowments and build their infrastructures. In the library world, a review of the literature shows an increase in publishing material about development and fund-raising, although a book of interviews with library leaders, published in 1988, shows that almost without exception, these leaders did not yet consider development to be an important part of their role and of the library's activities. One exception was Eastman, who said "Put to the test, a lot of library directors indicate that public relations and fund-raising are "soft" areas, not real library functions. In the years ahead, they may pay quite a price for that attitude."^[10] Although not targeting any specific type of library, another author wrote about donors and prospects for libraries in a blunt and outspoken manner that would have been unheard of 10 years earlier.^[11]

With the 1990s came a sudden expansion of the literature on academic library development and a geometric increase of the number of libraries engaged in development efforts.

The golden age for higher education in the United States was the 1950s and part of the 1960s. We began to see a downturn in funding in the 1970s that accelerated in the 1980s. True to form, we have seen an explosion of development activities in academic libraries since the early 1980s and in public universities during the 1990s.^[12]

Hood continues by identifying the various development-oriented groups that were created since 1980 to assist librarians and directors of library development with fund-raising issues; among these are Friends of the Library U.S.A. (FOLUSA), Development Officers of Research Academic Libraries (DORAL), and the Academic Library Advancement and Development Network (ALADN). All these groups hold annual meetings and sponsor listservs.^[12]

Although the literature discussing academic library development began to increase significantly in the 1990s, most of what was published remained in the “how I did it good at my institution” category. Despite some public complaint about a lack of research or theoretical structure, the literature tended to reflect the structure and problems of each author’s institution.^[13] The very newness of the field accounts for this lack of theory and reliance on practice. However, because each institution is unique and its advancement programs are designed to serve its own needs, the advice given in the literature should be regarded as examples, rather than as a prescription for every library to follow.

Recently published articles are building on the knowledge gained through the practice of a generation of librarians and development officers. Wedgeworth links fund-raising done by academic libraries to the better established field of professional public relations, indicating that despite differing organizational structures or goals, the process of identifying and developing constituencies is essentially the same.^[14] Surveys of librarians have begun to be published, giving the field some quantitative and qualitative data on which to make decisions in this area. Particularly useful is the survey of academic libraries done by Hoffman, Smith, and DiBona; it is an excellent example of basic research into fundamental issues, identifying factors that allow libraries to succeed or fail in fund-raising.^[15]

THE LAY OF THE LAND: THE ENVIRONMENT OF ACADEMIC LIBRARY DEVELOPMENT

As we enter the twenty-first century, the higher education sector is raising more money than ever before, and academic libraries are increasingly included in this effort, either because the library director aggressively forces the library to be inserted into the institutional effort, or because the academic administration expects it. At this writing, more than 20 universities are engaged in

multiyear comprehensive or capital campaigns with goals of \$1 billion or more; in most of these cases, the library is identified with specific goals and a dollar target.

In earlier years, libraries experienced some fluctuations in the numbers of support organizations; these structures grew during periods of financial constraint and shrank when there was ample funding.^[12] However, the downturn in support for higher education in the 1980s and 1990s has seen an explosion of development activities and support groups, which appears to reflect a fundamental change in the way that many libraries are organized and supported. The growing body of literature on library development is a direct result of the establishment of library development offices, with the attendant organizational structures and changes in roles (see below).

The more wealthy and larger a library is, the more likely it is to be engaged in development activities.^[14] As in so many areas, success breeds success; the larger and wealthier academic libraries seem to command the bulk of foundation and government grants.

The Library Within the Institution

The politics of the campus

As noted above, the view of the library as a special preserve, to be protected and shielded from the everyday concerns of the business world, is disappearing rapidly. Each institution handles this situation slightly differently, depending on its resources, goals, and priority of the library within the research and educational functions. Librarians must attempt to persuade university officers not only that libraries need external sources of funds but also that they are worthy of the effort required to find those funds in the same manner as do the schools and colleges of the university. At almost every institution, the library faces some barriers:

- No one ever graduated from the library.
- There is a perception that it is difficult to raise funds for libraries.
- The library is everyone’s second priority (their first being their own office or academic program).

Centralized versus decentralized development

Of primary importance is the organizational structure of development within the university at large. Such structures can be centralized, decentralized, or hybrid; each model has its advantages and disadvantages. With a centralized structure, all development staff report to, and are usually located in, the central institutional development office. Often, every development officer is asked to keep the library’s needs in mind when talking with potential donors. This approach is ineffective for the library; development officers tend to focus on the “sexier” academic

programs unless the university administration has made the library a specific high priority—a rather unusual circumstance.

With the decentralized model, each unit of the university handles its own development process. The library would need to create its own development positions and would retain control of its entire fund-raising planning and structure. This sounds appealing, but a major disadvantage lies in the lack of communication with the central development structure and its typical special support of areas such as planned giving, corporate support, prospect research, and special events staff.

The hybrid model, in which the library development staff are responsible just for library fund-raising but also have a formal relationship with the central development office, is likely to achieve the best results for the institution. No matter where the development officer reports, whether to the library director or to central development, the communication links between the two departments are likely to be healthy and more productive. The relationship of the library with the development office is key to its ultimate success; if the development office is not supportive of library goals, the effort to gain resources for the library will be significantly impaired.^[7]

The role of the library director

A rule of thumb is that people give to people, and the corollary for library development is that the library director plays a key role in ensuring the existence and success of the library's fund-raising efforts. A director who is uninterested in development, or who doesn't recognize the significance of external support, or who is reluctant to "schmooze" or to ask donors for gifts, is unlikely to be the leader of a successful fund-raising effort. At least one expert states that it is not necessary to hire a fund-raiser with a sizable track record because the success of fund-raising depends on the leader of the organization rather than on the fund-raiser.^[13]

Whether this statement reflects reality may be subject to argument; however, there is no question that the role of the library director needs to be that of a leader—to define the library's goals and level of involvement in development, and to be the face of the library in meeting its supporters. Most library administrators entered their field without recognizing that they might at some point be required to ask people for money, a task that many people find extremely difficult. There is little solid tradition, and certainly no formal education in our degree programs, to allow librarians to approach development and marketing with comfort.^[5] One suspects that in the next decade or two, library and information studies programs will incorporate fund-raising as part of administration courses. Current job listings for academic library directors are increasingly calling for

fund-raising responsibility, making it obvious to aspiring directors that this new function will take up some portion of their time.

Access to donors

A major issue on many campuses, and one that can be a considerable barrier to the library's fund-raising success, is the access that is provided to the donors. In most institutions of any size, a centralized database tracks alumni, friends, donors, and other supporters of the institution.

Many institutional development professionals feel that the university library presents a real challenge in garnering support. They argue that the colleges have a ready-made constituency in their graduates, whereas the library offers no degree and has difficulty building a loyal base of support.^[16]

It has already been pointed out that several institutional barriers exist for academic libraries wishing to raise external funds. Access to the institution's alumni and supporters is critically important to the library, yet in some instances these people, who potentially have more interest than any other group, are off limits to the library, usually unless they "self-identify," or come forward on their own as supporters of the library.

These barriers are foolish. No college or university is able to tap all of their alumni, neighbors, and other supporters, and finding in the library another possible attraction for the university's community should be regarded as a positive asset. At the very least, the library should be given access to those alumni who are nondonors, by presenting them with other options for supporting their alma mater.^[17] Indeed, when several members of a family attended a university, they might be alumni of different schools or colleges and can, therefore, contemplate a family gift to the library rather than trying to determine which of their schools should be the beneficiary of a family donation. Similarly, alumni of a reunion class all used the library, no matter what their major or school was; they can all support a gift to the library. The University of Pennsylvania has had great success in appealing to fiftieth reunion classes to focus their reunion gift on the library.

In some cases, universities are unwilling or unable to change their mode of assigning responsibility for donors. But in those cases in which the library is able to gain access to the university's constituency, its development officer is also likely to be able to "manage" donors when a case has been made that the donor is appropriately the supporter of the library. Sometimes the donor self-identifies; in other cases, another supporter has led the library to the donor; in yet other circumstances, the membership of the friends of the library leads to managed prospects and major gifts.

DEVELOPMENT TOOLS, SMALL TO LARGE

Successful library development involves a numbers of approaches, several of which are described here. These tools should be regarded as building blocks. It is not necessary for a library to participate in a capital campaign, but if it has not established a group of donors (friends of the library) and engaged in annual fund and major giving programs, any attempt to launch a capital campaign is unlikely to succeed. The small gifts and donors inevitably lead to larger gifts and more donors, and should not be ignored.

Friends of Libraries

Whether to have a friends' group or not is a question that has been under discussion for decades, for various reasons. The earliest such groups were formed in California in the 1890s, although they were not called by that name. The first "Friends of the Library" group was founded in Paris in 1913, as a support group for the Bibliothèque Nationale, with a branch of that group formed in Berkeley, California, in 1930. The first academic friends of the library was established at Harvard in 1925, followed within a few years by similar groups at Columbia, Yale, Princeton, and Johns Hopkins.^[2] This author's experience at Johns Hopkins brought her into frequent contact with the three surviving charter members of that group, all of whom continued to be very supportive of the library and very proud to be charter members.

At their very best, friends' groups provide resources for the libraries with which they are associated, and form the basic building block of the library's constituency. Because the library has no natural constituency as do the academic schools, it should be able to use the friends to attract people who like libraries, enjoy books, and value the education they received. In its turn, the library staff and development officer can use the members of the friends to identify people who, with additional cultivation, may be prospects for major gifts, planned gifts, or bequests. The funds raised by the friends can be used to support special events, newsletter production, staff to coordinate and manage the friends' group, and resources for special collections or other library functions.

Much of the cultivation of the friends group is very long term. Considered in the time frame of the present, with its priorities and constraints, cultivating a friends' group could seem to be an unwise use of resources, bringing little return. The utility of a friends' group has been a topic of discussion because some librarians believe that friends, or volunteers, take up too much time and often have a tendency to micromanage.^[2] There is no question that fostering a successful friends' group does take time, and given the wrong people in volunteer slots, micromanagement can be a problem. In a recent discussion, library

directors within the Association of Research Libraries learned that some of their colleagues intend to eliminate their friends' groups to focus entirely on the smaller group of supporters that provides them with major gifts.^[18]

However, this author's experience suggests that those people who are now major or planned giving donors often started out as \$10 or \$15 annual fund donors and members of the friends' group. With few other formal mechanisms available to the library to create its list of prospects, having a group of several hundred people as supporters is not at all unwelcome. Some of these friends can and should become members of the library's external advisory council or visiting committee (addressed below). The long-term benefits to be gained by attracting potential donors and obvious annual fund supporters to the library cannot be overemphasized.

Friends' groups are typically multifunctional, although which particular functions are the purview of any single group depends on local circumstance. Friends of libraries are usually (but not always) library supporters, and program events featuring books and authors are traditionally used to attract members. These groups also offer financial support, and as such constitute one of the elements of the library's fund-raising program. If the library's special collections are particularly strong, the group may focus its attention there, and the special collections staff may take on the role of managing the friends' activities. In a few universities (the University of Maryland is an excellent example), the friends group has one major meeting each year, but it is a black-tie affair with a distinguished speaker, and seats are available at a fairly high price.

According to Thompson and Smith,

College friends' groups will continue to flourish where they are embraced by the library administration, supported by the development staff, and honored by the community in which they reside. College libraries fortunate enough to have strong friends' groups will find these organizations are a means to continue strengthening the research and service they are able to provide to their constituencies.^[7]

Annual Fund

With or without a friends' group, academic libraries are increasingly involved in their institutions' annual fund drives. As with friends' groups, the annual fund drive carries with it both advantages and disadvantages. Like the friends' group, it is a high cost and relatively low contribution program, but also like the friends' group, it is likely to be very worthwhile over time. Libraries with long-standing friends' and/or annual fund programs can bring in considerable amounts of money each year, depending, of course, on the size of the alumni base, the dues assessed, and other factors. One observer suggests that revenues of \$25,000 annually are a reasonable

expectation; evidence suggests that larger libraries are typically able to bring in revenues of \$250,000 or more annually.^[6,13]

Most university or college annual funds allow donors to specify an area of the institution to which they wish their funds to be targeted. Even without a check-off box dedicated to the library, alumni and friends have the opportunity to give to the library, and many of them do so. Given the obstacles faced by the library as described above, the annual fund can provide access to the university's donor pool, permitting those who have an interest in the library to "self-identify" and, therefore, giving the library development officer a rationale for visiting them.

Annual funds are typically unrestricted, current-use funds. In some institutions, these gifts are taxed by the administration to fund unfunded priorities. Where possible, the library should attempt to retain the entirety of these gifts; if nothing else, the director is able to tell the donors that their gifts are fully supplemental to the library's budget. Donors like to feel that their dollars are making a real difference to the program that they are supporting. They rail at underwriting administrative costs and also dislike the notion that their monies are being used by the university for budgetary relief.

Libraries can carry on annual fund programs without having friends' groups; it is more difficult to define a friends' group without assuming that this group is an analog of the annual fund giving for the library, but it can be done. As we will see below, libraries are most likely to succeed in their fund-raising efforts when their friends' and annual fund programs are linked.

Major Gifts

The next step after the unrestricted, current-use giving programs for libraries is the major giving arena. Development professionals and librarians disagree in their definitions of major gifts, particularly as applied to libraries. When the development office defines a major gift as any six figure gift or more, it can be difficult for the librarian to argue that book fund endowments should be part of the library's major gifts program. However, unlike almost any other area of the university, the library can make excellent use of the payout from a \$10,000 or \$25,000 endowment. When that payout is \$500 or \$1250 annually, the library can purchase materials that are of benefit to the institution's students and faculty—and this can be very attractive to potential donors. An alumnus giving \$1000 annually can often be persuaded to increase that gift to \$2000, thereby creating a \$10,000 endowment over a 5-year period.

Once it is determined that the library should embark on a major gifts program, the library administration will need to clearly identify and describe the library's needs and its fund-raising goals. The central development office is likely to require annual targets for each university unit,

and the library's development officer should use this requirement as an occasion to plan the year—how many prospects will be visited? Which potential donors will be asked to consider a gift and at what level? What special events and programs will be held?

Armed with the list of names from the friends of the library and from annual fund giving, the library director and the director of development are then able to do the research necessary to determine which donors are capable of larger gifts and should be visited. Vast quantities of public data are available to give the fund-raisers guidelines regarding the possible size of gift that any particular donor might be able to consider.^[11] For example, libraries have an unusually high proportion of "never married/no kids" supporters—one demographic element that ranks high in the list of interesting characteristics of suspects and prospects. Elderly couples with many children and grandchildren, on the other hand, may be loyal library supporters but are unlikely to have the wherewithal to make a major gift to the library.

Unlike other areas of the university, libraries tend to receive a large number of gifts in kind. Someone moving out of a house to an apartment is likely to give the library very nice books that are not worth more than \$1 or \$2 each and that the library does not need to add to its general collections. A gift in kind of this nature can not be called a major gift, and the library should probably take as little time to process and handle these gifts as possible. Not to be overlooked, however, are the gifts in kind that represent truly important additions to the collection, and perhaps even special collections. A single book worth over \$100,000 can enhance the library's collection considerably and is just as valuable as a gift in cash of the same quantity to the library's fund-raising goals.

Planned Giving

"Estate planning, deferred giving and planned giving are the names commonly given [this] important area of fund raising."^[19] After a decade of a bull market, with the increasing number of senior citizens, and in a country where charitable giving is still supported by tax incentives, planned giving is an ideal tool for library development. In many circumstances, people are able to consider significant gifts by using vehicles such as bequests or charitable remainder unitrusts. The library will not see the funds immediately in most cases, so shouldn't count on supporting positions or even accomplishing an immediate building project. However, in the short run, these gifts count toward annual and campaign goals, and in the long run, the library will benefit significantly from the generosity of these donors.

Planned giving is a complex area; many universities have central staffs of planned giving experts to ensure that these gifts are structured appropriately and that the university is taking advantage of all the tools available to it.

A recent publication for librarians, although not totally focused on libraries, is very important in laying out all the options and considerations for not-for-profit institutions and their supporters.^[20]

Capital Campaigns

Institutional capital or comprehensive campaigns were mentioned earlier as vehicles by which many libraries are drawn into fund-raising. Indeed, colleges and universities began to embrace the campaign as a fund-raising tool in the 1970s, and by the early twenty-first century many universities seem to be perpetually in "campaign mode." Given this environment, libraries tend to participate in campaigns, together with the friends of the library, annual fund, and major giving programs that have heretofore sustained it.

The library director's active engagement with the planning of the campaign is key to the success of the library within that campaign. It is not unusual for universities to hire consultants to assist them in planning a campaign, and these consultants usually do a feasibility study to determine the state of readiness of the university's community for a campaign. Ensuring that a community understands what philanthropy is, and is ready to engage in such an activity in support of the university, is an important element of this study.^[21] Library participation at this stage in the development of a campaign can bring visibility to the library, so that the university administration and the consultants alike recognize the library's existence (not to be taken for granted!), needs, and potential donors.

Once it has been determined that a campaign is appropriate and likely to bear desirable results, the university/library will identify the institutional needs and priorities, associate dollar figures with these needs, and develop a pyramid chart that indicates how many gifts at each level the library requires to meet its goals. Matching the size and focus of the gift with the appropriate benefactor is a simple follow-up step if all the necessary research and planning has been accomplished. One expert says

Giving is a habit. Has your annual support grown over the last three years? Are the numbers of volunteers at least stable? Does at least half of your support come from a few large donors? Are your contributors thanked and informed on what happens to their gift? If these questions cannot be answered in the affirmative, you need to review and take corrective action before launching a campaign.^[21]

Because capital campaigns are more likely than the other tools to be run at the university level, much library activity will be dictated from above. What is the overall goal of the campaign and the goals for each university unit? How long will the campaign be? How many years will the campaign be in silent phase—it is usually thought that at least 50% of the goal needs to be in hand or

identified before the campaign goes public? What will the kickoff consist of? Will there be constituency (read 'library') kickoffs as well? At what level will the president of the institution participate and support the individual units of the university?

The appropriate goal for the library will be determined in much the same way as is the goal for the university at large. The consultants' feasibility study should take into consideration the number of library supporters and their capacity for giving. Some larger university libraries in the 1990s engaged in campaigns with goals of \$20 million or more; Harvard University Library's goal was \$76 million and was successfully reached.

Despite the doubts of librarians, campaigns do succeed, and they succeed in building a future for the library. This author, 5 years after the commencement of the campaign at Georgetown, suddenly found that payout from recently established endowments was making a real difference to the total library budgeting process. The campaign, even at that time, had worked to provide the library with the additional funds it so needed to appropriately support the teaching and research programs of the university.

FUTURE OF DEVELOPMENT

The future of development requires some consideration here. Technology is now able to insert itself into the development process and not only to provide lists and reports. It is now possible to use the Internet as a communications device with donors. Also, the previous narrative has identified some issues that clearly will need to be addressed by librarians involved in the areas of development and fund-raising.

Development on the Web

With the increased ability of universities and colleges to carry out transactions on the Web, libraries are beginning to use their home pages to publicize the opportunities for giving or for joining the friends of the library, and in some cases they are able to accept credit card numbers to pay for friends' dues. An advocate suggests that most nonprofit organizations should move to a Web-centric communications model, as being just an update of communication by telephone.^[22] This approach clearly has tremendous implications for the future.

In considering the use of the Web, libraries need at first to determine where in their website there should be mention of giving, or of the Friends of the Library. A brief assessment of ARL libraries' home pages shows widely varying practices. About one third of the libraries have placed some reference to giving or the friends on their home pages; another large group (perhaps 50%, although this is a moving target) refer to library support, but not on

the library's home page; and about 15% carry no reference to giving or support at all.^[23]

Websites can be used to great advantage in various ways. Libraries can recognize major donors by devoting pages to the donors and their gifts. Electronic plaques, online pledges, e-mail to the friends of the library support staff, signing up to attend events, and remote access to the library's information structure are only a few of the possibilities that the Web presents.^[22]

However, the future is not here yet. To design a total development program around the Web would assume that all our donors are online and that it is easy for colleges and universities to gain access to the e-mail addresses of their alumni and friends. Neither assumption is accurate at this date, and one should anticipate that traditional means of communication will gradually mingle increasingly with Web communications until a critical mass of our population is Web-familiar and our own systems for keeping up with e-mail addresses are more sophisticated than they are now.

Theoretical and Philosophical Bases for Fund-Raising

As mentioned above, the library field lacks literature on the theoretical and philosophical foundations of fund-raising. With additions to the literature such as that of Hoffman, Smith, and DiBona, this situation is gradually being rectified.^[15] Typically, library literature begins to cover a specialty with pragmatic articles and treatises, moving only later to analytical and philosophical discussion. Library fund-raising is just now at the point where the doers and thinkers are starting to contribute to the philosophy of the profession, and that trend should continue in the future.

Institutionalization of Fund-Raising

Several experts have suggested that until fund-raising is seen as a "regular" part of library services, it will not be regarded as a part of a library's operating expenses.^[6] Just as information technology was initially not considered a full part of the library organization, structure, and activity, neither is fund-raising in today's library world. Without the full incorporation of these functions within the library, either by assigning responsibility for development to existing staff or by hiring development staff, the fund-raising program will always be seen as separate, and perhaps only temporary. Experience shows that a development structure is not at all temporary, and to gain the most from this function, it needs to be perceived as a permanent partner within the library organization.

Surveys indicate that the factors of success for a library development program are the age of the program itself; the size of the donor pool; the level of involvement of the library director; the amount of time that is able to be

devoted to development, by the library director, by the director of development, and by other library staff; the type of institution, because private colleges and universities still raise more money than do public institutions; having a friends group that is part of the annual fund process; adopting high monetary goals; and maintaining a strong and positive connection to the central development office.^[15]

The best protection the library can have...is the institutionalization of the fund-raising process...While research, cultivation, solicitation and recognition will still be the fundamentals of the fund-raising process, its incorporation into the broader efforts of library management to improve the library's visibility, tell the library story, set a vision for the library of the future, and gain support from key constituencies is likely to result not only in successful fund-raising campaigns but also in a more effective organization.^[14]

CONCLUSION

Library fund-raising and development have become a part of many librarians' everyday lives. Once considered foreign territory, an area inappropriate for librarians to wander, development is now incorporated into the process of ensuring that our libraries have sufficient resources to provide necessary support to the students and faculty of our universities. Literature that once was sorely lacking is becoming a standard commodity of the tables of contents of journals and of the book lists of library publishers.

The changing world of higher education has made it almost imperative for librarians to be fully engaged in the process of fund-raising and development. Fighting the old adage that "it is impossible to raise money for libraries," an increasing number of academic libraries participate in their institutions' campaigns with impressive goals or conducting their own major gifts programs.

Libraries need to build constituencies and define directions that make it clear to those both inside and outside the university what payoff results from investments in the university's library. Each library director will have to work with his or her community, development office, potential and actual constituency, and administration to identify the best way in which to supplement increasingly scarce resources. Development, the library world's newest special function, serves as the means to insert the library's interests into the overall institutional goals.

Library Leadership and Management Association (LLAMA)

Robert Allen Daugherty

University Library, University of Illinois at Chicago, Chicago, Illinois, U.S.A.

Abstract

This entry outlines the history of the Library Leadership and Management Association, a division of the American Library Association, from its establishment as the Library Administration Division in 1957 through the celebration of its 50th anniversary in 2007 when it was the Library Administration and Management Association to its recent name change in 2008. It includes details about its mission and vision, organizational structure, programs, publications, and awards.

INTRODUCTION

The Library Leadership and Management Association (LLAMA) is a national organization, one of 11 divisions of the American Library Association (ALA). The mission of LLAMA is to encourage and nurture current and future library leaders, and to develop and promote outstanding leadership and management practices. Personal, organization, and corporate members number more than 5000 and represent all types of libraries. Members include library workers at all levels as well as those who support libraries. Division-wide committees include Budget and Finance, Continuing Education, Financial Advancement, Leadership Development, Marketing Communication, Membership, Mentoring, Organization, Program, Publishing, and Strategic Plan Action Committee as well as committees devoted to Cultural Diversity Grants, Recognition of Achievement, and a Web site Advisory Board.

There are seven sections to address major areas of interest: Buildings and Equipment (BES); Fund Raising and Financial Development (FRFDS); Human Resources (HRS); Library Organization and Management (LOMS); Measurement, Assessment, and Evaluation (MAES); Public Relations and Marketing (PRMS); and Systems and Services (SASS). Several less formal discussion groups are comprised of Assistants to the Director, Diversity Officers, and Women Administrators; other groups are comprised of members who are interested in issues related to Dialog with Directors, Middle Management, Library Storage, Education, Government Affairs, and Research.

The Library Leadership and Management Association is well known for its conference and pre-conference programs at the ALA Annual Conference as well as for regional institutes. In addition to these continuing education events, the Division produces publications and awards related to its mission and goals.

ORIGINS AND HISTORY OF LLAMA

The ALA was organized in 1876 and incorporated in 1879. The American Library Association included such standing groups as the Large Libraries Section, the Library Administration Committee, the Library Architecture Committee, etc. Following several years of study, the ALA reorganized in 1956/1957. While some divisions continued, others were established and more clearly delineated as the type-of-library and type-of-activity or function structure characteristic of ALA today. The Library Administration Division (LAD) formed to focus on general personnel administration, library organization, buildings and equipment, financial administration, insurance, public relations, statistics, relations with library governing bodies, governmental relations, legislation, and friends groups.

The mission of LAD was the general improvement and development of all aspects library administration, at all levels of administration in libraries, and for all types and sizes of libraries. Preexisting ALA groups transferred to LAD included the Federal Relations Committee (created 1923), Library Legislation Committee (1923), Public Relations Committee (1923), Friends of Libraries Committee (1929), Insurance for Libraries Committee (1929), Buildings Committee (1932), Equipment Committee (1931), Statistics Committee (1936), and the Board on Personnel Administration (1936).

The Library Administration Division had specific responsibility for

1. Continuous study and review of the activities assigned to the division and of the changing developments in those activities.
2. Conduct of activities and projects within its areas of responsibility and stimulation of the development of these activities in libraries.
3. Synthesis of the activities of all units within ALA that have a bearing on the type of activity represented.

4. Representation and interpretation of these activities of libraries in contacts outside the profession.
5. Stimulation of the development of librarians engaged in its type of activity and stimulation of participation in appropriate type-of-library divisions.
6. Planning and development of programs of study and research in those areas of activity for the total profession.^[1]

The broad focus, along with the other major restructuring within ALA, provided something of a *tabula rasa* for the new type-of-activity division. In addition to reconciling and coordinating the activities of the other committees that had been cobbled together to form it, LAD needed to coordinate with other existing type-of-library divisions to clarify and refine their respective areas of responsibilities. Early on, there was a LAD Committee on Recruitment with subcommittees devoted to recruiting for children's librarians, for school librarians, and for college and university librarians, as well as for cataloging and classification. Similarly, the Division's LOMS Section had committees devoted to statistics for school libraries, for public libraries, and for college and university libraries, as well as a statistics coordinating committee. The BES Section also formed committees based on types-of-libraries, as did the Public Relations Section.

While these reflected the past, there were also committees being formed to deal with urgent and emergent issues. The LOMS Advisory Committee on USOE Statistics was formed even as the plans for the ALA reorganization were being finalized. (See also Appendices 1 and 2, listing the Division Presidents and Executive Directors.) In 1958, the Government Relations Section established a Copyright Revision Committee to deal with anticipated activities and actions occurring during the 1960s and 1970s; and, in 1961, that Section became ALA's Legislation Committee. In 1959, LAD formed its Advisory Committee for the Library Technology Project. This ALA project was announced that year and, although its initial interests were in such mundane items as supplies and machinery, automation developments and applications quickly came to the fore throughout ALA, its divisions, and the profession at large.

The Friends of Libraries Committee, established in 1929 as an ALA committee and a foundation committee of LAD in 1957, was active within PRMS for many years. At ALA Annual Conferences, audiences were delighted to hear such significant luncheon speakers as Sir Edmund Hillary, mountaineer and explorer (1962); Clifton Fadiman, author, editor, and radio/television celebrity (1967); Alex Haley, author of 'The Autobiography of Malcolm X' (1968); Helen Hayes, first lady of the theatre (1969); Rep. Julian Bond, State of Georgia (1970); Erich Segal, author of "Love Story" (1971); and William Blatty, author of "The Exorcist" (1972). In 1979, members formed Friends of Libraries USA (FOLUSA) and incorporated as an

independent organization in 1984. It is a national leader in library support and advocacy.

Given the broad responsibilities from its inception, LAD encountered criticism as it sought to define itself through its interests and activities. In the early 1960s, there were concerns expressed that its growth and influence had extended beyond its proper sphere, encroaching upon the provinces of other divisions. These concerns were referred to the ALA Committee on Organization (COO).

The ALA COO report on the place of the LAD in the ALA structure conclusions:

1. Some assignments to LAD have dealt with matters other than purely administrative, and some have been limited to a single type of library.
2. While there may have been too broad a definition of LADs field of responsibility, there is evidence that some divisions have been giving too narrow and literal an interpretation of their own fields of responsibility.
3. The dual principle in the reorganization theory, i.e., type-of-library as against type-of-activity, has not been followed perfectly. Perfection may well be impossible, since the logic upon which the principle is based is not absolutely flawless.
4. Under the reorganization, the type-of-activity divisions seem to feel they are faring well. Since they are new, there is some reason to believe that where no fixed patterns of thought have existed, groups have been able to work well, but that where there were older fixed patterns of thought, it has been difficult for the group to adjust to the new pattern of organization. The new type-of-library divisions which emerged in the reorganization are as creatively active as type-of-activity divisions.
5. The reorganization principle stated thus: "Matters concerning one kind of library activity or service in two or more kinds of libraries are the responsibility of a type-of-activity division; and, conversely, matters concerning two or more kinds of activities in one type of library are the responsibility of that type-of-library division," is sound. This is the principle which has not altogether been followed in the assignment of projects.
6. Statements from the divisions seem to offer no evidence that such drastic action as the dissolution of LAD is required to resolve the dissatisfactions which have been expressed to COO.
7. Despite its complexity, the present organizational pattern of ALA is basically sound and deserves to be given at least 10–15 years of wholehearted support before a radical reorganization is considered. The framework exists within which to solve specific organizational problems, other than those of personality conflicts.

RECOMMENDATIONS OF ALA COO

1. The LAD should be retained as a division of the ALA, subject to the conditions outlined in the recommendations which follow.
2. Certain modifications in the scope of LADs activities should be achieved by:
 - a. Revision of LAD's statement of responsibility to clarify and limit the phrases "library administration in general" and "library organization."
 - b. Greater care in the assignment of projects or programs to divisions, particularly those involving expenditure of a significant amount to money.
 - c. Further study and reassessment of certain activities now being carried on in LAD about which question has arisen and which are possible candidates for reallocation to another division.
3. The committee urges the adoption of a policy within ALA which will encourage the individual divisions to conduct as many and as varied activities as they can, giving due consideration to monetary costs and the activities of other divisions or associations.
4. The committee recommends that the Executive Board and staff find some specific means of reviewing activities and assignments promptly and if possible before their inception, to assure as far as possible a judicious decision in making the assignment.
5. Some study should be given by the Membership Committee, the committee on Constitution and Bylaws, and other appropriate officers or agencies to proposals received from various sources that LAD membership be on a different basis than in other type-of-activity divisions.^[2]

ANNUAL CONFERENCES, PRE-CONFERENCES, AND INSTITUTES

At the ALA Annual Conferences, LLAMA typically offers both pre-conference and conference programs for continuing education. These address current administration, management, supervision, and leadership issues as well as current trends and "hot" topics. A review of programs can trace the changing emphases over the years. In the early years, particularly contemporary programs covered the Library Services Act (1957); Copyright Law Revisions and Libraries (1959); Standards in Library Technology (1959); Physical Requirements for Bookmobiles (1960); and Urban Renewal and the Library (1961).

In the 1960s, developments in a couple areas were the focus of programs as well as having an impact on the organization. Library automation, particularly of circulation functions, prompted such programs as An Administrative Look at Circulation (1963); Library Circulation Systems—from Hand Charging to IBM (1964); The

Prospect and Hardware for Computerized Circulation Systems (1966); Circulation Automation—Anti-Blue Sky: Practical Thoughts About Systems Planning (1967); Library Equipment Institute: Charging Systems (1968); Architectural Requirements of Circulation Services (1968); and Criteria for Evaluating a Library Circulation System (1972). Throughout these attentions paid to circulation automation, libraries were concerned about getting books back to ensure initial thoroughness of the database and tighter inventory control, so there were programs like Rx for Book Recovery—Practices to Obtain the Return of Books (1962); Security Methods Used to Forestall Book Thefts (1965); and Circulation Security Systems (1973). Similarly, there was interest in The Essential Role of the Circulation Librarian (1969) and The Role of the Circulation Librarian in Book Selection, Public Services, and Book Preservation (1970). For LLAMA, along with RUSA STARS, the future of resource sharing is now of increasing importance: Circulation + : Redefining Access (1989). These developments and interests were similarly reflected in the Division's magazine, *LA&M*, over the years.

The interest in circulation was also reflected organizationally. As early as 1958, within ALA, an Ad Hoc Committee on Circulation Services was formed "to prepare a statement of field of interest, to suggest an organizational attachment, and to provide continuity for the group while it is considering organization."^[3] There was an initial recommendation for a Circulation & Reserve Services group to become part of the Resources & Technical Services Division. Circulation roots grew quickly in LAD—a Circulation Discussion Group was established in 1961; a Circulation Controls Committee in LOMS (1962); and in 1966, the Division established its Circulation Services Section, renamed Systems and Services Section (SASS) in 1983 as it broadened its scope to cover management of other library systems.

Buildings and equipment issues have also been among the original interests of the Division. Selecting and working with architects, the library building process, space, remodeling, and retro-fitting are on-going concerns and the focus of various activities even beyond conferences, preconferences, and institutes—publications and awards are built around them, as well. Current regional institute curricula include various topics in building projects, administration and management, diversity, HRS, and PRMS. Topics and details, including presenters, are available at the LLAMA Web site

Long, over-arching interests in better statistics have also been reflected in programs, organization, and other activities of the Division. These interests have been the focus not only of ALA units but also of governmental agencies, particularly those dealing with educational institutions. The ALA Statistics Committee, established in 1936, was one of the original Association-wide committees incorporated in the foundation of the LAD in 1957.

The section dealing with LOMS started with separate committees devoted to college and university library statistics, public library statistics, school library statistics, and a statistics coordinating committee. By 1975, there were additional LOMS committees for state libraries, for reference services, for technical services, and for nonprint media. Eventually, a separate Statistics Section was formed to pull together and coordinate activities related to statistics, their collection and use.

Outside the library profession, the National Center for Education Statistics (NCES), located within the U.S. Department of Education is the primary federal entity for collecting and analyzing data related to education. The Higher Education Act requires the completion of data surveys for institutions participating in any federal student financial assistance programs. The Higher Education General Information Survey Series was designed to provide comprehensive information on various aspects of postsecondary education in the United States and its territories. The Integrated Postsecondary Education Data Systems is now the core postsecondary education data collection program for NCES. There is a library component that includes library resources, physical facilities, staffing patterns, salaries and wages, number of employees, level of educational attainment, current expenditures, and learning resource centers.

The Division also offers national conferences and regional institutes for continuing education. Historically, its institutes have addressed both general and specific management and administration issues. Human Resources issues have always been central to the Division's mission and are prominent in continuing education offerings: recruitment, training, and retention; organizational culture and effectiveness; team building; leadership development and staff appreciation; diversity; group decision-making; and, conflict management.

Increasing attention was devoted to leadership development. The Personnel Administration Section (PAS, now HRS), formed a Staff Development Committee in 1975. In 1982, midwinter planning sessions were begun, with leadership development as one of their goals. By 1986, a mentor program was implemented; 2 years later, LOMS formed a Leadership Discussion Group. In 2003, with the support of a grant from World Book, Inc., Library Administration and Management Association (LAMA) designated 10 new members as Leaders of the Pack—part of a 3 year program to develop new leaders. Beginning in 2006, LAMA took advantage of the ALA-wide Emerging Leaders program. Given the recurrent attention to and discussion of the centrality of leadership issues, an amendment to change the name to the LLAMA was put on the 2008 Spring Ballot and won overwhelming membership approval.

There are other continuing education activities. Among these have been some courses designed to support the Certified Public Library Administrator program. In 1996,

the executive boards of LAMA and the Public Library Association approved development of this post-MLS program of professional development for public librarians. The Association of Specialized and Cooperative Library Agencies quickly approved the proposal as well. "The focus on identifying and certifying competencies in both professional and preprofessional staff dates back to LAD's earliest days." Most recently, many of ALA's divisions have been working to develop competencies for the Library Support Staff Certification Program. More information on both these programs is available at the Web site of the ALA Allied Professional Association.

PUBLICATIONS

The Library Leadership and Management Associations quarterly magazine, formerly known as *Library Administration and Management (LA&M)* and now as *Library Leadership and Management (LL&M)*, is available to members online at the Division's Web site. The Division news blog, *Leads from LLAMA*, is also at that site. The Division has produced a number of monographs. Current titles include:

- Outstanding Public Relations: 60 Years of the John Cotton Dana Award*, by Amy Shaw and Peter Deekle.
- New Supervisors in Technical Services: A Management Guide Using Checklists*, by Emily Bergman and Andrea Kappler.
- Growing Leaders from Within — A Practical Guide for Recognizing and Developing Leadership Skills in the Library*, by the LAMA HRS Section.
- Risk and Insurance Management Manual for Libraries*, by Mary Breighner, CPCU, and William Payton; Jeanne M. Drewes, general editor.
- Fundamentals of Library Supervision*, by Joan Giesecke and Beth McNeil.
- Checklist of Library Design Considerations*, 4th Ed. by William W. Sannwald.
- Powerful Public Relations*, Ed. by Rashelle S. Karp
- Building Blocks for Planning Functional Library Space*, Ed. by the LAMA BES Facilities Committee
- Practical Strategies for Library Managers*, Ed. by Joan Giesecke
- Scenario Planning for Libraries*, Ed. by Joan Giesecke.
- Staff Development: A Practical Guide*, 3rd Ed., by Beth Avery, Terry Dahlin and Deborah A. Carver.

AWARDS

The Library Leadership and Management Association administers one of ALA's most prestigious awards, the John Cotton Dana Public Relations Award. Sponsored by H.W. Wilson since 1946, it honors outstanding library

public relations efforts. In recognition of their achievement, John Cotton Dana award winners receive a cash development grant of \$5000. The awards are presented at an elegant reception, hosted by H.W. Wilson, held during the ALA Annual Conference.

The Library Leadership and Management Association BES administers two biennial awards, given in alternate years. The American Institute of Architects Awards, co-sponsored by ALA and the AIA, encourage excellence in the architectural design and planning of libraries. Awards for distinguished accomplishment in library architecture by an architect licensed in the United States are made for any library in the United States or abroad. The ALA/International Interior Design Association (IIDA) Library Interior Design Award, cosponsored by ALA and the IIDA, honors excellence in library interior design and promotes examples of extraordinary design reflected through innovative concepts.

The Diana V. Braddom FRFDS Scholarship is available to library staff from all types of libraries to support learning new fundraising skills, enabling them to increase funding to their libraries from public, private, and corporate sources. The Scholarship was begun in 2001.

The Library Leadership and Management Association Cultural Diversity Committee's Cultural Diversity Grant is awarded to LLAMA members or units in support of the creation and dissemination of resources that will assist library administrators and managers in developing a vision and commitment to diversity, and in fostering and sustaining diversity throughout their institutions. The Committee, formed in 1991, established a Diversity Fund in 1994 and the grant in 1997.

The PRMS Section's first "Swap and Shop," a program that displays library public relations and promotional materials from hundreds of libraries of all sizes and types, was held in 1974. Judges select Best of Show winners based on content, originality, design, format, and effectiveness.

The LLAMA/YBP Student Writing and Development Award Contest, begun in 1998, is for students enrolled in a graduate program in library and information studies. Applicants submit essays on an announced theme. The winning submission is published in an issue of the Division's quarterly magazine. The author also receives a travel grant, funded by YBP, Inc., to be used to attend the ALA Annual Conference, where he/she is recognized at the LLAMA President's Program and the first meeting of the LLAMA Board of Directors.

CONCLUSION

Starting its existence as the LAD in 1957, to acknowledge the development of interests and activities that had taken place during its first two decades, the name changed to the Library Administration and Management Association.

The next three decades led to yet another name change, to the Library Leadership and Management Association, in 2008. The Division has targeted other professional organizations with which to establish partnerships in creating new leadership programs and opportunities. These programs reach out to staff at all levels and in all types of libraries to meet the needs of individual members as well as the organizations in which they serve.

ACKNOWLEDGMENTS

Colleagues at the ALA headquarters have been very helpful and supportive in this and other endeavors devoted to the history of LLAMA. In particular, I thank Karen Muller in the ALA Library and Lorraine Olley in the LLAMA office. Other LLAMA members working on aspects of the history who merit special mention are Robert F. Moran, Jr., and Gregg Sapp, with whom I worked on documenting and writing about the first 50 years of LLAMA.

Library of Congress Classification (LCC)

Abstract

The Library of Congress Classification (LCC), originally designed for classifying the Library's own collection, is now used in a wide range of libraries, both in the United States and abroad. This entry recounts its history and development from its genesis to the present time, leading up to an explanation of LCC structure, tables, and notation. It then considers the system's potential for wider application in the online age, through speculation on using LCC as a tool for (a) partitioning large files; (b) generating domain-specific taxonomies; and (c) integrating classification and controlled subject terms for improved retrieval in the online public access catalog (OPAC) and the Internet. Finally, analyzing both its strong and relatively weak features, it addresses the question of whether in its current state LCC is in all respects ready for playing such roles.

INTRODUCTION

The Library of Congress Classification (LCC), developed for the Library's own use, has been adopted by so many other libraries that it has become one of the most widely used classification systems, particularly among large academic and research libraries in the United States and around the world. Several major factors have contributed to its wide acceptance:

1. Its wide-ranging and thorough coverage.
2. Its continuous revision.
3. Its dependability (in respect to maintenance) through its support by the Library of Congress (LC).
4. Its flexible, very hospitable, and expandable notation (i.e., its book numbering or labeling system).
5. Its base in literary warrant (the term "literary warrant" in the context of library classification indicates that new topics are added to the schedules as they are needed to reflect the subject content of the literature or materials being cataloged or classified).
6. The wide accessibility of its schedules, in both electronic and print versions.
7. The fact that LCC class numbers, as well as *Library of Congress Subject Headings* (LCSH), appear on almost all LC cataloging records and many records in OCLC's (Online Computer Library Center's) WorldCat. Further considerations may be that the system holds promise as one of the important elements in new systems to improve retrieval on the Internet and in the online public access catalog (OPAC).

To date, LCC has been applied primarily in the library environment, where, traditionally, its notation has

provided a sequence for the shelf-ordering of library materials. Even in this role, LCC has had an information retrieval function; generations of library users have relied on classification as a means of locating wanted material on shelves or have used shelf browsing as one of the ways to discover related resources. A major question posed by this entry is whether, given modern searching amenities, LCC can also play a significant role in the future information environment. Many believe that it can. We turn first to clues from LCC's history and development.

BACKGROUND

The history of what was eventually to be LCC can be said to have begun in April 1800, when the American legislature was preparing to move from Philadelphia to the new capital city of Washington, D.C. A congressional act passed at the time provided \$5000 "for the purchase of . . . books . . . for the use of Congress and the said city of Washington." A second act, in January 1802, called for the appointment of a librarian by the nation's president; soon thereafter, President Jefferson appointed John Beckley, then Clerk of the House, as the first Librarian of Congress.^[1]

For the next several years, the collection was not classified in the current sense of the term; rather, books were arranged by size and, within size groups by accession number. Such an arrangement was fairly common at the time; and was used in many libraries for much of the 1800s. However, before Congress moved to Washington, its members used Benjamin Franklin's Library Company of Philadelphia. That library, ever since 1789, had been using a subject-based classification system for its

holdings, a system based in part on a work by Francis Bacon published in 1605 and also on another work by Jean le Rond d'Alembert published in 1751.^[2]

The first LC catalogs, published in 1802 and in 1804, reflected the collection's size and its accession order arrangement. The 1808 catalog, however, revealed added categories for some bibliographic forms, and the 1812 catalog showed that the Library had by that time moved toward arranging books by subject, following the system used by the Library Company of Philadelphia.^[3]

The next change was dramatic. In August 1814, when the War of 1812 was still raging, British soldiers set fire to the Capitol, and most of the Library's collection, which by then had grown to about 3000 volumes, was destroyed. Subsequently, Thomas Jefferson offered to sell Congress his personal library of 6487 volumes. The books arrived already classified by a system Jefferson had devised himself, a system also based on the work of Bacon and d'Alembert. Jefferson's system provided for 44 main categories with many subcategories. His scheme, with many changes made for practical rather than theoretical reasons, remained in force almost until the turn of the next century.^[4] By that time, in spite of another disastrous fire in 1851 that destroyed two-thirds of the collection,^[5] the LC collection had grown to at least 800,000 items.^[6]

However, despite the fact that there were only minor changes in the library's approach to classification from Jefferson's time until the end of the century, developments during that period were not without influence on the library's future role in both classification and subject cataloging. One was the gradual change in opinion on the role of the library. Early in the century, under the direction of librarians J. S. Meehan (1829–1861) and J. G. Stephenson (1861–1864) and under the oversight of the Congress's Joint Committee on the Library, the library was viewed as merely a service agency for Congress. Its collection was narrow in scope, and little used. That picture changed through the influence of Ainsworth Spofford, who was Librarian of Congress from 1864 to 1897 and who served the library in various positions from 1861 until 1908. Spofford believed that there should be a national comprehensive collection available not only to members of Congress but to the general public and directed both the library's acquisitions program and its lending policies to that end.^[7,8]

Development of the Library of Congress Classification

The next chapter in LCC's history was again rooted in a move, this time, in 1897, to the magnificent building it still occupies. The move itself, plus the size and continuous rapid growth of the collection, demonstrated that the Jefferson-based classification was no longer

adequate for the Library's needs. The collection by that time was approaching a million items. John Russell Young, then Librarian of Congress, was in agreement with J. C. M. Hanson and Charles Martel (head of the catalog division and chief classifier, respectively) that reclassification was necessary. After an investigation that found extant schemes unsuitable for the library's use for one reason or another, Hanson and Martel concluded that a new classification should be developed using Charles A. Cutter's *Expansive Classification*^[9] as a guide to the order of classes but with a modified notation. Young, who died suddenly in January 1899, was succeeded by Herbert Putnam, who also strongly supported reclassification. After much consultation and deliberation, the decision was made in 1900 to proceed with the development of an entirely new classification scheme. Work on the new classification began in 1901. The notation question was resolved by the choice of capital letters for main classes, with numerical expansion for subtopics and with gaps in the sequence left for future development. Hanson's 1901 proposed outline shows the use of only single letters for main classes, but his 1903 outline shows that he had moved to using double letters for major subclasses. The latter change was significant, because it greatly increased the hospitality, i.e., the expansion potential and ability to accommodate new subjects, of the new LCC system.^[10,11]

As work began on the classification, each subject class was developed by specialists in the subject at issue who worked under the general direction of Hanson and Martel.

For all the classes, Martel worked out a "common arrangement pattern" which he referred to as his "seven points." The first six points covered general materials; the seventh was for specific subdivisions of the topic at issue. Martel's seven points^[12] included

1. General form divisions: periodicals, societies, collections, dictionaries, etc.
2. Theory. Philosophy.
3. History.
4. Treatises. General works.
5. Law. Regulation. State relations.
6. Study and teaching.
7. Special subjects and subdivisions.

This pattern, used whenever applicable, brought a degree of unity to the classification as a whole that would probably not have been achieved without it.

The separate schedules were published (in individual print volumes) as they were completed. Although some schedules took decades to be finished, all of them except Class K (law) had appeared by 1948. (The final Law schedule, Religious law, was published only recently, in 2004.)

The separate development of individual schedules meant that, unlike most other classification systems, LCC was not the product of one mastermind. The schedules that make up the classification were (and are) developed, published, and maintained separately; indeed, LCC has been called “a coordinated series of special classes.”^[13] This aspect of the system, each separate schedule prepared by experts in the subject area of the class being developed, lessened the homogeneity and predictability of the system as a whole. On the other hand, to quote Richard Angell, former chief of the LC Subject Cataloging Division, the system was “praised for the freedom allowed in each schedule for development according to its subject field’s own intrinsic structure.”^[14]

Once a schedule was published, work began almost immediately on its revision; this was necessary in order to accommodate new topics, new relationships, and terminological changes that are continually found in new material being cataloged. Additions and changes are communicated to the library community through *Library of Congress Classification (LCC) Weekly Lists*.^[15] Another source of such information is the Gale Research Company’s publication *SuperLCCS*,^[16] the yearly issue of each schedule contains the entire class or subclass incorporating additions and changes for the past year.

It bears noting here that, until the mid-1990s, the LCC schedules existed mainly as print products. Maintenance and revision remained basically manual tasks that were extremely labor-intensive and therefore both costly and slow. The conversion of LCC to electronic form became imperative. Work began in 1993 and was completed in 1996. For several reasons, the conversion to electronic form, which was done using the *USMARC* (now called MARC 21) *Classification Format*,^[17] was an especially important development for LCC. That the change greatly improves internal operating efficiency goes without saying. For one thing, it enables much more efficient production of the print schedules. More important, it not only enables LCC to be consulted online but allows it to be part of new and powerful search tools.

Print versions of the schedules are still being produced as the extent of revisions dictates. However, the electronic version, *Classification Web*,^[18] which includes a full-text display of the entire LCC plus correlations between LCC and LCSH, is in essence up to date and is heavily used.

Because all classes—there are 21—are constantly being revised as the LCC editors strive to keep abreast of the times, by now (2008) most schedules have undergone thorough revision at least once, and for some schedules many times. In total, whether consulted electronically or through the 41 volumes of the print version, LCC functions as a general, well-maintained, and comprehensive library classification scheme.

LCC STRUCTURE AND NUMBERING SYSTEM

Because LCC is largely an enumerative system, i.e., a system that lists numbers for complex as well as single subjects, the classification as a whole requires little number building. The extensive author tables in Class P (literature) and the form tables in Class K (law) are the most noticeable exceptions.

As was the case at its beginning, LCC main classes are denoted by one capital letter, and subclasses are represented by two or three capital letters followed by the Arabic numbers 1–9999 treated as integers. To provide for expansion there are gaps left between integers, and the integers may be expanded decimally where needed. They can also be expanded by Cutter numbers, a system originally invented by Charles A. Cutter, which uses a combination of a capital letter and one or more Arabic numerals, read decimally. For general use, Cutter numbers are available in multiple versions with different levels of details, for example, the *Cutter-Sanborn Three-Figure Author Table*.^[19] In its classification, both for item numbers and when further subdivision is needed under topics, the Library of Congress uses a much less elaborate table that is based on Cutter’s scheme.^[20] The resulting letter–number combinations are referred to as “Cutter numbers.” The use of that table is indicated by instructions and/or tables appearing where applicable throughout the schedules.

Within individual schedules, there are many internal tables, using numerals or Cutter numbers that apply only to specific segments of the classification. The extensive tables for schedules K (law) and P (literature), however, appear in separately published volumes. In addition, a few tables, published in *classification and Shelflisting*,^[21] are used throughout the system.

In sum, although LCC began as an enumerative rather than a faceted classification, over the years, it has moved gradually toward faceting, through the increasing use of tables. Furthermore, the system is not rigid: Its notational system can be expanded in more ways than one to accommodate new and developing subject matter. In other words, both LCC’s notation, and the classification itself, are remarkably hospitable to changes in what is known and written about.

The following details, discussion, and examples give substance to the brief description just provided.

LCC MAIN CLASSES, SUBCLASSES, AND DIVISIONS

The following list shows LCC’s main classes with their alphabetical designations. Discussions of main classes, subclasses, divisions of subclasses, and LCC’s numbering system follow the list:

A	General works
B	Philosophy. Psychology. Religion
C	Auxiliary sciences of history
D	History (general) and history of Europe, Asia, etc.
E–F	History: America (Western hemisphere)
G	Geography. Maps. Anthropology. Recreation
H	Social sciences
J	Political science
K	Law
L	Education
M	Music
N	Fine arts
P	Language and literature
Q	Science
R	Medicine
S	Agriculture
T	Technology
U	Military science
V	Naval science
Z	Bibliography. Library science. Information resources

Main Classes

The rationale for the arrangement of LCC's main classes was explained by Charles Martel, one of the persons responsible for the original planning and supervision of the development of the system. Class A, general works, not limited to any particular subject, leads the scheme. It is followed by Class B, containing philosophy and religion, which sets forth theories about human beings in relation to the universe. The next classes (C–G history and geography) in the sequence cover such concepts as the human abode and the source of humanity's means of subsistence, humans as affected by and affecting their physical milieu, and the mind and soul of humanity in transition from primitive to advanced culture. The next group, Classes H–L, deals with the economic and social evolution of human beings. Classes M–P (music, fine arts, and language and literature) concern human aesthetic and intellectual development. Viewed in large groups, it can be seen that Classes B–P taken together form the group of the philosophical–historical and philological sciences, while the second large group, Classes Q–V, embraces the mathematical–physical, natural, and applied sciences. Bibliography, which in many libraries may be distributed throughout different subject classes, shares the same class (Z) with librarianship and information resources.^[22]

Subclasses

Each of the main classes, with the exception of E and F, is divided into subclasses that represent disciplines or major branches of the main class. Class Q, for example, is divided into the following subclasses:

Q	Science (general)
QA	Mathematics
QB	Astronomy
QC	Physics
QD	Chemistry
QE	Geology
QH	Natural history (general)—Biology (general)
QK	Botany
QL	Zoology
QM	Human anatomy
QP	Physiology
QR	Microbiology

Divisions

Each subclass is further divided into divisions that represent components of the subclass. For example, the subclass chemistry has the following divisions:

<i>QD</i>	<i>Chemistry</i>
1–65	General Including alchemy
71–142	Analytical chemistry
146–197	Inorganic chemistry
241–441	Organic chemistry
415–436	Biochemistry
450d–801	Physical and theoretical chemistry
625–655	Radiation chemistry
701–731	Photochemistry
901–999	Crystallography

Each of the divisions, in turn, has subdivisions (often called Martel's seven points) that specify different aspects of the subject, such as form, time, place, and more detailed subject subdivisions. In many schedules, the progression of subject provisions still mirrors these seven points, which were described above. The exception is point 5 (Law. Regulation. State relations. Legal topics). Legal matters, which had been scattered in different classes in earlier schedules, were moved to the law (Class K) schedules at the time they were being completed.

NOTATION (NUMBERING SYSTEM)

As mentioned earlier, the LCC uses a mixed notation of letters and Arabic numerals to construct call numbers. Main classes are represented by a single letter, for instance, K (law), N (fine arts), and Q (science). Most subclasses are represented by double or triple letters, for instance, QD (chemistry), DJK (history of Eastern Europe), and KFF (law of Florida). Classes E and F, the earliest classes to be developed, have not been divided into subclasses.

Divisions within subclasses are represented by Arabic numbers from 1 to 9999 (as integers) with possible

decimal extension, and/or with further subdivision indicated by Cutter numbers (as noted above, a system originally invented by Charles A. Cutter^[23] and modified for use with LCC, using a combination of a capital letter and one or more Arabic numerals).

The call number is completed by an item number based on the main entry (author or title) in the form of a Cutter number plus, in most cases, the year of publication. There are two common patterns of LC call numbers; they differ in the fact that in the second pattern the class number includes a topical extension expressed by a Cutter number.

1. Class number:
One, two, or three capital letters
Whole number 1 through 9999
Possible decimal extension
Item number
Cutter number based on main entry
Year of publication, as required
2. Class number:
One, two, or three capital letters
Whole number 1 through 9999
Possible decimal extension
First Cutter number based on term for topic, place, or form
Item number
Second Cutter number based on main entry
Year of publication, as required

The following examples show typical forms of LC call numbers:

1. SD131.S29 2005 *Forests in landscapes: ecosystem approaches to sustainability*, by Jeffrey Sayer and Stewart Maginnis; assisted by Michelle Laurie. 2005
Class number
SD (two capital letters) Forestry
131 (whole number) General works
Item number
.S29 (Cutter number based on author's name Sayer)
2005 (Year of publication)
2. DJK7.75.V57 2005 *Virtual Slavica: digital libraries, digital archives*, edited by Michael Neubert. 2005
Class number
DJK (three capital letters) History of Eastern Europe
7.75 (whole number with decimal extension of whole number) Electronic information resources
Item number
.V57 (Cutter number based on the title: Virtual. . .)
2005 (Year of publication)
3. HD9651.9.D8 N3513 2007 *Nylon and bombs: DuPont and the march of modern America*, by Pap A. Ndiaye; translated by Elborg Forster. 2007
Class number
HD (two capital letters) Industries. Land use. Labor
9651 (whole number) Chemical industries

.9 (decimal extension of whole number) By firm
.D8 (Cutter number expansion for further subdivision) DuPont

Item number

.N3515 (Cutter number based on author's name) Ndiaye
2005 (Year of publication)

4. N6512.5.P6 D67 Pop art and the contest over American culture, by Sara Doris. 2007

Class number

N (one capital letter) Fine arts
6512 (whole number) United States. Twentieth century
.5 (decimal extension) Special aspects or movements
.P6 (Cutter number for further subdivision) Pop art

Item number

.D67 (Cutter number based on author's name) Doris
2007 (Year of publication)

An LC call number may contain no more than one or two Cutter numbers. Call numbers for certain types of maps and atlases, however, may contain an additional letter-number combination that appears to be a third Cutter number but is actually an extension of the class number.

An important characteristic of LCC notation is that it is not hierarchical beyond the class/subclass level. Thus, in contrast to the notation for Melvil Dewey's *Decimal Classification*, LCC notation does not reflect all the general/specific relationships that are inherent in the scheme itself. There has been some criticism of LCC's nonhierarchical notation on this basis.^[24] However, in some respects, the absence of notational hierarchy can be viewed as an advantage for LCC. For one thing, most of its class numbers are thereby relatively brief and are thus easily manageable for shelving or other purposes. For another, in part because hierarchical relationships are largely ignored in the notation, LCC is remarkably "hospitable": provisions for new subject matter can be easily added to the system.^[25] This is a most important consideration in light of the rapid increase in world literature, both in the number of "pieces" and the range of subject matter, disciplines, and genres that are represented. Further details and explanations of the LCC notation can be found in *Classification and Shelflisting Manual*.^[26]

LCC'S POTENTIAL IN THE FUTURE ONLINE ENVIRONMENT

Early in this entry, it was stated that a major question facing those interested in LCC is whether it can play an important role in tomorrow's information environment.

At this time, mid-2008, there is considerable debate on the matter even within the library sector of the information professions. Some claim that library classification has had its day. On the other hand, there are those who believe that, quite the contrary, there are many areas and operations in the current information environment in which the use of a classification scheme that is kept up to date—as are both the Dewey and the LC schemes as well as some others—could make a significant contribution. These beliefs spring from three sources: First, awareness of the huge size and amorphous nature of the world's current store of accessible information; second, the observation that there are many specialized interest areas that would benefit from custom-designed organization schemes; and third, doubts that, with currently available search options, retrieval from the Internet is as thorough and as efficient as it could be. Three areas in which classification could make a positive contribution are noted below.

Partitioning Large Files

In recent decades, the Internet has seen an extraordinarily rapid growth. It now contains an enormous, hardly imaginable, heterogeneous store of electronic resources. Increasingly, many libraries and research institutions, recognizing the richness and overwhelming quantity of information available on the Web, have incorporated selected Web resources into their local online systems or portals. As time passes, with the rapid growth and phenomenal proliferation of electronic resources, it is becoming more and more apparent that effective means are needed to organize what the Internet has to offer. In addition to providing keyword searching, major holders of online resources, as well as Web resource providers themselves, have turned to directory or hierarchical schemes as means of categorizing and organizing their resources for access (e.g., a library-based system that uses LCC for this purpose is Cyberstacks on the Iowa State University Web site).^[27]

Furthermore, recent developments in taxonomy and ontology indicate an increasing interest in a directory or categorical approach to organizing Web resources. This is a logical development; after all, classification was devised in the beginning as a response to the need for organizing large bodies of material. If such interest should continue, database managers and system designers may find that existing schemes based on hierarchical structures are promising candidates for serving as organizational models. Where LCC could make a particular contribution is in its detailed and specific provisions, its broad range of coverage, and its ease of access. Those who turn to classification as a way to manage huge databases are likely to try broad subject divisions first. Thus, the broad main classes, in whatever scheme they choose, would be a logical and effective way to start. But, as time goes on, if and when database or Web managers see a role for finer and

finer topical divisions, they will find they have already been worked out and are at hand.

Generation of Domain-Specific Taxonomies

The existence of topical collections—special libraries being a case in point—shows that people involved in different fields of work have long found it productive to use collections of materials narrowly focused on their domains. Knowledge, it seems clear, is becoming more and more specialized. The usefulness of such collections may be enhanced if they are categorized by a scheme that does justice to the areas at hand. LCC may be of considerable help in this respect. Because it has been developed and maintained by subject specialists, LCC has sometimes been viewed from a theoretical standpoint as a scheme lacking an overall coherent and logical structure. However, from another perspective, this apparent weakness is a source of strength. The specialists responsible for a given area in a classification scheme are in a better position than generalists to keep the schedules for that area in conformance with current notions of how topics within it are either interrelated or related to other areas previously thought to be outside that area's bounds. The result of the departmentalized approach of LCC is that individual classes or parts of the scheme—such as the classifications of law, religion, art, and cartographic materials—are fully and painstakingly developed to the point that they can either be adopted as stand-alone specialized schemes or can serve as models for developing such schemes. Classification modules or miniclassification schemes with special foci can also be built on the basis of LCC to meet the needs for effectively organizing Web resources and digital libraries in specific subject areas. Where more details are needed in a particular situation, say to represent multitopics or subtopics, the basic structure of LCC could be extended to suit special situations and purposes. Another advantage is that specialized schemes based on LCC could be interoperable among one another within the main LCC structure. The availability of tools such as *Classification Web*^[28] greatly facilitates such operations.

LCC and LCSH as a Combined Retrieval Tool

Finally, there is promise in a vehicle that would map LCC captions against terms in LCSH.^[29] The goal is to create a merged search term system that would serve as a hidden cross-reference chain. In such a system, when a user submitted a search term the system response would include all the items that matched his or her search term in either LCSH or LCC, as well as all the items that were linked to that term in either system's cross-reference structure. If the users wanted to refine the search, they could be offered options such as “associated topics?,” “narrower topics?,” or “broader topics?.” Such a system for merging classification captions and controlled subject vocabulary mapped

each against the other has great potential for improving information storage, discovery, and retrieval. One of its advantages would be that it would link synonyms through the already existing references from lead-in terms to the “preferred term.” Another and more important advantage is that it would offer a searcher two approaches to his or her chosen topic. This duality is possible because classification and subject headings complement each other. A subject heading or descriptor, along with its cross-reference apparatus, represents a particular topic treated from all aspects. On the other hand, classification of a topic places it among related topics treated from the same perspective or within the same discipline. Traditionally, each approach has a specific function in information storage and retrieval. Used together, they can improve both effectiveness and efficiency. The Library of Congress has already taken steps toward such a system. In LCSH, many headings are editorially linked to specific LC class numbers. In addition, under each LC class number in *Classification Web*,^[30] the user can find up to 10 LC subject heading strings that are closely associated in the LC catalog. Implemented in a search vehicle, the gain in discovery and retrieval power would be tremendous. Were such the case, LC access provisions could have an even wider retrieval role to play in the future than they have had in the past.^[31]

Library of congress classification in the future

One of the aims of this entry was to consider the questions of whether, first, there are roles LCC might reasonably play in the wider information environment, and second, whether LCC in its current state (mid-2008) is ready to do so. The first question was addressed in particular above, under the heading “LCC’s Potential in the Future Online Environment.” It is the second question that is addressed now (mid-2008). To answer this question we propose to begin with taking a new look at some of the criticisms that have been levied against LCC in the past.

Criticisms and Problems

Guidelines

One aspect that caused concern in the past was how few official guidelines there were respecting subject analysis in general and the application of LCC in particular. With the publication of *Classification and Shelflisting Manual*, 2008 Ed^[32] this concern has been largely addressed.

National bias

A more fundamental concern was that the classification reflected a national bias. Because the Library was founded as a library *for* members of U.S. Congress, its early concentration on U.S. materials during the 1800s was natural. Over the past century, however, the collection has become

more and more general because many outside libraries are now contributing new classification numbers through SACO (a subject authority cooperative program). As a result, the subject scope of LCC is continually expanding at the same time that its national bias is decreasing.

Multitopical works

Another concern, a problem LCC shares with many other classification schemes, is its paucity of provisions for multitopical works. The problem is rooted in the still-prevailing limit of one class number per work, a rule that was appropriate when a primary function of classification was to determine the order of volumes on shelves. In the online age, however, the one-number-per-work limit holds only in the sense of designating a prime class number to indicate where a work is best shelved. With a change in policy, this problem could be easily solved: Assigning a class number for every significant topic covered in a work could be as much taken for granted as assigning multiple subject headings.

Obsolescence

A serious issue common to all classification systems is combating obsolescence, in other words, keeping systems up to date. The Library of Congress has a firm policy of continuous revision of its classification, a process that often involves moving topical provisions from one part of the schedules to another. This fact puts the Library in an uncomfortable position: it must balance the need for timely revision of its classification with the contrary need to maintain the system’s stability because relocations within the schedules entail an often overwhelming amount of work for participating libraries.

There is a particular factor bearing on reclassification that cannot be ignored. Creating new classes or subclasses or divisions, or revising existing provisions to any extent, is the most intellectually challenging and time-consuming work in all of librarianship. It is therefore the most costly and may thus be hindered for budgetary reasons. Should more use be made of LCC in the future, there remains the matter of the expense entailed in ensuring that revision of the classification keeps pace with the times, that, in a more timely way than was allowable when knowledge was not expanding so fast, it is able to reflect new knowledge without distortion and without burying the old.

LCC Strengths and Potential

Strengths

LCC has been hailed as a system that has proved to be practical and widely accepted. In Arthur Maltby’s words,

"It is a triumph for pragmatism."^[33] Its merits were enumerated at the beginning of this entry and are repeated more briefly here: It is very widely used; its coverage is wide-ranging and thorough; it is continuously revised; it has the support of the Library of Congress; its notation is terse, flexible, and expandable, and it is widely accessible in both electronic and print versions. That it is time-tested should give prospective users the confidence that the bugs, so to speak, have had time to work out. And the fact that each schedule was developed and is maintained by subject specialists rather than by generalists ensures the validity of its coverage. Therefore, to the extent that LC's continuous maintenance policy is not behind schedule due to budgetary constraint, the system is kept up-to-date and additions and changes are communicated to the cataloging community in a timely fashion. Furthermore, the availability of the online version of LCC has improved both its accessibility and its ease of application.

On the purely practical side, because LCC is a largely enumerative system, there is little number building, making the scheme relatively easy to use. And because LCC notation is compact, there is less likelihood of error when LCC numbers are assigned or input as search keys.

In sum, LCC, originally designed specifically for the Library's own collection, has become a comprehensive and hospitable classification used by many other large libraries. Furthermore, in recent years the Library of Congress has made a great effort to communicate with those who use LCC. Both its records and information about its policies are made easily and widely available, a demonstration of LC's sense of responsibility toward its user community.

CONCLUSIONS

In 2008, we are now in a different information age from when classification was used primarily for shelf-ordering and for browsing: the Internet, information databases, and OPACs (online public access [library] catalogs) are currently the primary search vehicles for those searching for topical information. Thus, new questions are being asked about classification itself and about LCC in particular. Among them are:

Is classification dead as an approach to searching?

The answer is no, not, at least for broad partitioning. Witness Google's many subdivisions by type of material covered. There is now a Google Books, a Google Business, a Google Earth, a Google Health, and a Google Scholar among the 20 search choices offered for those who access Google's search system.

Does LCC have the potential for playing a wider retrieval role in the future than in the past?

The answer here is yes. Three possible and specific new applications were described in an earlier section of this entry.

Is LCC as it stands ready to play wider roles?

The answer is: there is considerable potential. An encouraging fact for LCC overall is that in recent times there seems to have been an increasing interest in a directory or categorical approach to organizing Web resources. If such interest should continue, database managers and system designers may find that existing schemes based on hierarchical structures are promising candidates for serving as organizational models. Where LCC, as well as other comprehensive classification schemes, such as the Dewey Decimal Classification and the Universal Decimal Classification, could make a particular contribution is in its detailed and specific provisions, its broad range of coverage, and its ease of access. The broad main classes, in whatever scheme is chosen, would be a logical way to start. But if, as time goes on, if and when database or Web managers see a role for finer and finer topical divisions, they will find they have already been worked out and are at hand.

Library of Congress Genre/Form Terms for Library and Archival Materials

Janis L. Young

Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

Library of Congress Genre/Form Terms for Library and Archival Materials (LCGFT) is a multidisciplinary thesaurus that provides indexing terminology to describe what works *are*, rather than what they *are about*. Traditionally, access to genres and forms of works has been provided with subject headings, which poses two problems: first, subject headings are by definition more properly restricted to the topic of a work, and second, the rules for application of subject headings often treat forms secondarily to the topic, thereby limiting access.

This article will explain the differences between subjects and genres and forms, and put LCGFT in the context of other vocabularies that provide genre/form access. The development of LCGFT is a large undertaking, and the project management will be described. The majority of the entry will elaborate on the principles upon which LCGFT is built (the choice of authorized terms and the syndetic structure) and the application of terms. Finally, the article will outline developments in the provision of access to characteristics of works and expressions that are closely related to genre and form: musical medium of performance, intended audience, characteristics of creators and contributors, and time period of creation.

INTRODUCTION

Library of Congress Genre/Form Terms for Library and Archival Materials (LCGFT) is a unified, cohesive, multidisciplinary, easy-to-use controlled vocabulary that is built on twenty-first century principles of thesaurus construction. Independent of *Library of Congress Subject Headings* (LCSH), LC's best-known vocabulary, LCGFT builds on some of the principles that have made LCSH so popular while seeking to provide access to what a work *is* instead of what it *is about*.

In development since 2007, LCGFT remains a work in progress. Fundamental decisions regarding the scope and structure of the vocabulary and the application of terms have been made, but are subject to policy shifts as the thesaurus grows and more experience is gained with assigning the terms. The project's background, context, and management are outlined below, followed by a discussion of the characteristics of LCGFT and its application.

BACKGROUND AND CONTEXT

Before explaining the characteristics of LCGFT, it is important to understand what genres and forms are, and how they differ from subjects. *American Heritage* defines genre as "a category of artistic composition, as in music or literature, marked by a distinctive style, form or content."^[1] Traditionally, genre is most

closely associated with works of the imagination, as is evident by the definition of genre supplied by Martha Yee in *Moving Image Materials: Genre Terms*: any recognized category of fictional works which is characterized by recognizable conventions, that is, a group of works all of which tend to explore the same themes and use the same plot formulae, character-types and icons.^[1]

The major genres are often part of the collective consciousness of a society. When one thinks of Westerns, for instance, one thinks of the desert southwest, sagebrush, cowboys and Indians, cattle rustling, and shootouts. Other well-known genres include action, adventure, horror, romance, and thriller.

Form, on the other hand, is defined by Yee as "any recognized category of works characterized by a particular format or purpose."^[2] The introduction to the *Moving Image Genre-Form Guide* further elucidates that form is "separate from [a work's] actual content, not necessarily implying a particular narrative construction."^[3] Therefore, form relates to organization or format (e.g., atlases, poems), length (haiku, short films), original publication parameters (periodicals, television programs), technique (3-D films, animated television programs), and purpose (educational films, proclamations).

The subject of a work, on the other hand, is the topic being discussed or depicted. A work may be a war film (the genre) that is animated (the form), and be about World War II (the subject). In some ways, genre and form are closer to descriptive cataloging than to subject

analysis, but access to them has traditionally been provided as part of controlled subject vocabularies.

Two major multidisciplinary English language vocabularies that provide both subject and genre/form access are *Sears List of Subject Headings*^[4] and *Library of Congress Subject Headings*.^[5] Both include main headings that describe genres and forms (e.g., **Directories**; **Pastoral poetry**; **Short stories**), but sometimes restrict those headings' use. In LCSH, for instance, form headings may not be assigned to individual works of fiction, although they may be assigned to collections. An individual play may be assigned a form heading only if it includes a topical aspect (e.g., **Detective and mystery plays, American**), or if the play is of a highly specific form (e.g., **Carnival plays**).^[6]

The rules are slightly less stringent in *Sears*, wherein any literary form heading can be assigned to collections by multiple authors, but "Headings describing the major literary forms (such as **Drama**; **Fiction**; and **Poetry**) and the headings for the major forms of a national literature (such as **Irish drama**; **Russian fiction**; and **Italian poetry**) are never assigned to an individual work or to a collection by a single author." Scope notes indicate that some minor literary forms and genres such as **Ballads**; **Fables**; **Horror fiction**, etc., may be applied to individual works, but headings for these minor forms that are qualified by nationality or language are not eligible for assignment to individual works.^[7]

These policies may make it difficult for users to find all of the literary works of interest to them (e.g., love stories by American authors), because most of the literary works in library collections are separately published.

In both LCSH and *Sears*, the primary means of indicating form is to append a form subdivision to the end of a topical subject heading instead of using a form heading. Using *Sears*, for example, an encyclopedia of the American Civil War would be assigned **United States—History—1861–1865, Civil War—Encyclopedias**, while in LCSH the heading would be **United States—History—Civil War, 1861–1865—Encyclopedias**. In both cases, the form of the work is **—Encyclopedias**, and is treated secondarily to the topic. This is opposed to the thought process of many users, who are more likely to think of the form first, as indicated by the common question, "Do you have any encyclopedias about the Civil War?"

Another issue with using general subject vocabularies that include headings for genres and forms is that the form headings are generally coded in the 150 and 650 fields of the MARC 21 formats for authority and bibliographic data, respectively. These fields are defined as being for topical terms, that is, for subjects, not genres or forms.^[8] In libraries that follow the general practice and code form headings in the 650 field, users search for genres and forms by doing a subject search. The display mixes the two, as can be seen in this example using LCSH:

Horror stories.

Horror stories—Dictionaries.

Horror stories—History and criticism.

Horror stories—Themes, motives, etc.

Horror stories—United States—History and criticism.

Horror stories, American.

Horror stories, American—History and criticism.

Horror stories, German.

Users looking for works that *are* horror stories have to know to select the headings that are not subdivided, such as **Horror stories**, and **Horror stories** qualified by a nationality (e.g., **Horror stories, American**). The rest of the headings in this list denote works *about* horror stories, that is, horror stories as the subject matter.

In 1979, the Machine-Readable Bibliographic Information committee (MARBI) of the American Library Association ameliorated this situation by defining the 655 field for genre/form terms in the MARC 21 bibliographic format, and some libraries chose to use it for form headings authorized by general subject vocabularies.^[9] However, the associated authority fields, 155 (for the heading) and 455, 555, and 755 (for references) were not defined until 1995.^[10] These fields made it possible for computers to distinguish between subjects and genres and forms, thereby enabling separate searches for the two, once data was encoded in the 155/655 fields.

Many English language controlled vocabularies are devoted to providing genre/form access to materials in a specific discipline or to specific types of materials. Examples include *Guidelines on Access to Individual Works of Fiction, Drama, Etc.* (GSAFD), which primarily includes terms describing literary works, but also includes some terms for major genres of radio and television programs and films; the *Radio Form/Genre Guide*; the *Moving Image Genre-Form Guide* (MIGFG); *Moving Image Materials: Genre Terms*; and *Controlled Vocabularies for Use in Rare Book and Special Collections Cataloging*, a suite of vocabularies developed and maintained by the Bibliographic Standards Committee of the Association of College & Research Libraries' Rare Books and Manuscripts Section.

Some discipline-specific vocabularies include subject headings along with headings describing genres and forms. The *Thesaurus for Graphic Materials* (TGM) is used to describe still-image media and formats such as photographs, cartoons, and pictorial ephemera. Formerly published in two parts, one dedicated to subjects and the other to genres and formats, TGM was merged into a single vocabulary in 2007.^[11] The *Art & Architecture Thesaurus* (AAT) is a comprehensive vocabulary that is used to describe all aspects of art, architecture, decorative arts, material culture, and archival materials.^[12] The *AFS Ethnographic Thesaurus* includes terminology from folklore, ethnomusicology, cultural anthropology, and related fields.^[13] Finally, *Medical Subject Headings* (MeSH) covers terminology in the area of the health sciences.^[14]

All of these discipline-specific vocabularies make important contributions to genre/form access. They generally are most useful to libraries, museums, and archives that have extensive nonbook or special collections because the vocabularies enable deep, granular analysis of the materials. The exceptions to the general rule are GSAFD and MIGFG, which have been adopted by many public and general academic libraries, and MeSH, which is used not only in specialized medical libraries but also in universities that offer degrees in the health sciences.

Unlike *Sears* and LCSH, specialized vocabularies generally do not distinguish between individual works and collections in their rules for application, making the cataloging treatment more even. However, each specialized vocabulary has its own syntax and rules for application, which can sometimes cause collocation problems within a catalog. Take for example an academic library that uses MIGFG for its film collections, GSAFD for literary works, and LCSH for nonfiction, including film and literary criticism. A user writing a thesis about the relationship between modern detective novels and films of the same genre would probably want to view a sampling of films, read a sampling of novels, and also read published criticisms and histories of each. They would have to know three different syntaxes to find relevant materials:

Detective and mystery films—History and criticism

[LCSH; film criticism]

Detective and mystery stories—History and criticism

[LCSH; literary criticism]

Mystery—Feature

Mystery—Short

[MIGFG; films]

Mystery fiction

[GSAFD; novels]

When it comes to providing access to genres and forms, therefore, most libraries have been left with two choices. Use LCSH or *Sears*, which usually subordinate genre and form to the topic and also put restrictions on the assignment of headings, or use multiple specialized vocabularies for different types of media, which requires users (and catalogs) to master multiple syntaxes.

LCGFT seeks to address this problem by creating a multidisciplinary vocabulary with a standard syntax that allows for more consistency within catalogs while also bringing genre and form to the forefront. Both aims simplify search and discovery. Since it uses a modified form of LCSH syntax, users who are already familiar with LCSH (or *Sears*, which also employs a modified form of LCSH syntax)^[4] do not have to learn a new way to search. Furthermore, terms from LCGFT may be applied to individual works as well as to collections. The overall impact of LCGFT is increased access to many categories of works that formerly were at best difficult to find, or at worst,

hidden from users despite the fact that they were fully cataloged.

PROJECT MANAGEMENT

Since 2007, the year in which the first genre/form terms were approved, the Policy and Standards Division (PSD) of the Library of Congress has collaborated with the library community to develop LCGFT.

To allow for an orderly rollout of terms, LCGFT is being developed discipline by discipline. As of this writing, the vocabulary includes terminology for cartographic materials, law materials, moving images (films and television programs), nonmusical sound recordings (primarily radio programs), literature, music, art, and religious materials, as well as “general” terms—those terms that do not fit into a specific discipline, such as dictionaries, encyclopedias, and handbooks. Other projects, including newspapers, and science, have also been suggested and may be undertaken after the current projects are completed.

There are three major benefits to the orderly rollout. First, it provides predictability. When the project for a specific discipline is finished, all of the major terms in that discipline are available for use, thereby ameliorating the confusion that would result if terms for poetry, for example, were available before terms for fiction. Second, it allows developers to adjust policies incrementally as issues are discovered and resolved, meaning that a policy shift might affect a few dozen terms instead of hundreds. This minimizes the negative impact of revisions on catalogs, librarians, and users. And finally, the orderly rollout allows for effective collaboration.

PSD is spearheading the development of the vocabulary, but relies heavily on three groups for assistance: LC’s librarians, who provide their subject and format expertise; the general library community, which comments on public discussion papers that are posted on LC’s website; and last but not least, organizations with an interest in particular disciplines.

To date, PSD has formally partnered with four organizations, each of which has developed a thesaurus in its area of interest with the goal of incorporating the thesaurus into LCGFT. PSD’s first partner was the American Association of Law Libraries, which provided terms for legal materials. The Music Library Association and the American Theological Library Association also agreed to assist PSD in developing terms for music and for religious materials, respectively. In 2008, the Subject Analysis Committee (SAC) of the Association for Library Collections and Technical Services (ALCTS), a division of the American Library Association, formed the Subcommittee on Genre/Form Implementation (SAC-SGFI), which was charged with helping to facilitate two-way communication between PSD and the cataloging communities with an interest in genre/form terms. SAC-SGFI took on the task

of developing vocabularies for literary works and for general terms. Finally, the Art Libraries Society of North America partnered with LC to develop terms that describe works of art.

Each project is considered complete when the terms from that discipline are implemented at the LC. That does not mean, however, that the list of terms is closed. Proposals for new and revised genre/form terms, which appear on tentative lists and are vetted for inclusion in LCGFT, may be submitted by Library of Congress catalogers and participants in the Subject Authority Cooperative Program (SACO) of the Program for Cooperative Cataloging (PCC). Also, as noted above, the lessons learned in later projects may require that authorized terms, references, or scope notes from earlier projects be modified or cancelled from LCGFT.

AUTHORIZED TERMS

Library of Congress Genre/Form Terms for Library and Archival Materials includes terms for works and expressions as defined in *Functional Requirements for Bibliographic Records*.^[15] That is, the authorized terms indicate the intellectual or artistic expression, not the manifestation—the physical characteristics—of the item. For instance, in LCGFT, the word “film” refers not to reel-to-reel motion picture film (a physical carrier) but to works that were originally recorded on motion picture film, on video, or digitally. This policy allows for collocation of all of the manifestations of a work under a single term, instead of requiring the user to search separately under every possible carrier type.

To be eligible for LCGFT, concepts must indicate the genre or form of a work or expression, and not refer explicitly to any other closely related characteristics: intended audience; ethnicity or nationality of the creator (s); setting, including the time period depicted; time period of creation; popularity of the work (e.g., best sellers); and, in the case of music, the medium of performance (e.g., flute, tenor voice). Also excluded from the thesaurus are terms that are already provided elsewhere in the bibliographic record, including language and date and place of publication or production. However, these characteristics may be included implicitly in the meaning of the term, such as in the term **Actualities (Motion pictures)**, which refers to a specific form of short, unedited, silent films from the early days of cinema.^[16]

At the time of this writing, there are a few practical exceptions to these policies, particularly in relation to children and people with disabilities as intended audiences. However, the intent is to remove terms such as **Children's films** and **Films for the hearing impaired** from LCGFT when there is another place to code that information. For more information, see the Related Developments section, below.

Terms are based on literary warrant. This means that there are works or expressions to which the terms can be assigned, and also that the terms are included in reference sources appropriate to the term. Each authorized term consists of a word or phrase that represents a single concept, and is always presented in natural language order to facilitate searching (e.g., **Outtakes**; **Remote-sensing maps**). Parenthetical qualifiers are used occasionally to distinguish between and among homonyms when it is not reasonable to construct an adjectival phrase due to common usage (e.g., **Thrillers (Motion pictures)**; **Thrillers (Radio programs)**; and **Thrillers (Television programs)**).

While there are parallel terms in LCGFT—such as the three terms for thrillers—the preference is to avoid them within a single discipline wherever possible. For instance, there are terms for specific types of maps (e.g., **Topographic maps**; **Physical maps**), but similar terms for topographic atlases, physical globes, and the like do not exist. Since by definition an atlas is a collection of maps, and a globe is nothing more than a spherical map, the appropriate term **Atlases** or **Globes** is assigned (i.e., postcoordinated) with the genre/form term for the type of map. Therefore, a road atlas is assigned two postcoordinated terms: **Road maps** and **Atlases**. Likewise, in the area of literature, there will not be a term such as the term *Fantasy short stories* does not exist. Instead, there are two terms, **Fantasy fiction** and **Short stories**.

The preference is to establish terms in English, but terms from other languages are permitted under two circumstances: when no English term for the concept exists and the foreign-language term has been borrowed into English, and when the concept is unique to the language of the work being cataloged and cannot be found in English-language reference sources. For example, **Heimatfilme** are German films and are known by the German word in the English-speaking world.^[16]

Although LCGFT includes some very specific terms (e.g., **Coutumes**, a form of French medieval customary law^[16]), the policy is to prefer more general terms. The general terminology makes cataloging simpler, since most artistic and literary works provide only the broadest indication of genre and form. Overly specific terminology would in many cases require catalogers either to guess at the appropriate term or to read/view the entire work. Relatively general terms also serve users' needs, particularly with regard to artistic and literary works. General terms collocate more works and serve as a form of readers' advisory, while defining terms too narrowly would separate similar works from each other and require users to look in multiple places for works of interest to them.

In addition, subject matter is excluded from the terms to the extent possible, considering that genre can sometimes be inextricably linked to subject matter in literary and artistic works. Recall that *American Heritage* defines genre as “a category of artistic composition, as in music or

literature, marked by a distinctive style, form or *content*” [emphasis added].^[1] The line between genre and subject can be fuzzy, as indicated by the initial inclusion in LCGFT of sport-specific films (e.g., **Football films**). In 2012, PSD and LC’s Motion Picture, Broadcasting, and Recorded Sound Division decided to remove those types of terms from LCGFT. They were originally included because they already existed in LCSH as form headings. However, further analysis made it clear that films focused on a particular sport may fall into one of many genres, including, but not limited to, suspense films, thrillers, comedies, or romances. A single plot element (i.e., the depiction of a sport) does not, therefore, constitute a genre. Instead, the sport is the subject.^[17]

The distinction between form and subject is generally easier to codify than the distinction between genre and subject. By definition, form designates the format or purpose of the work, independent of the content.^[3] Therefore, LCGFT will not include terms such as *Science periodicals*, preferring instead the term **Periodicals**. The topic, science, is indicated with a subject heading. There are some apparent exceptions to this, such as **Legal maxims**, but by definition legal maxims are quite different from general maxims. Legal maxims are statements of established principles of law,^[16] while a general maxim is a “succinct formulation of a fundamental principle, general truth, or rule of conduct.”^[1]

STRUCTURE

The guiding principles for the structure of LCGFT are contained in ANSI/NISO standard Z39.19-2005, *Guidelines for the Construction, Format, and Management of Monolingual Controlled Vocabularies*,^[18] which is followed as closely as is practical.

Equivalence Relationships

Synonyms of the authorized terms are provided in Used For (UF) references, as are alternate forms of the authorized term itself, including inverted forms. The UFs provide additional entry points into the vocabulary and lead users to the authorized terms. Some typical examples of UFs are as follow:

Film auditions
USE Screen tests

Laws, Session
USE Session laws

Hierarchical Relationships

The hallmark of a thesaurus is the use of hierarchical relationships.^[19] In LCGFT, every discipline has a

“broadest” or “top” term that serves as the collocation point for all of the terms from each discipline (e.g., **Cartographic materials; Literature; Motion pictures**). Except for the broadest terms, every authorized term in LCGFT must have at least one broader term (BT). The terms exhibit the class/class member relationship: each narrower term (NT) must by definition be part of the group defined by the BT. The hierarchical relationships of the term **Comedy films** are illustrative.

Comedy films

BT Motion pictures

NT Dark comedy films

NT Parody films

Comedy films is the class and **Dark comedy films** and **Parody films** are the class members. All parody films are comedy films, as are all dark comedy films. On the other hand, only some comedy films are dark comedies or parodies. Likewise, all comedy films are motion pictures, the broadest term in the film hierarchy.

While most terms belong to only one hierarchy, terms may occasionally belong to multiple hierarchies if appropriate. A good example is **Oral histories**, which has the BTs **Discursive works**, **Filmed interviews** and **Interviews (Sound recordings)**.

The general preference is for flatter, rather than deeper, hierarchies, corresponding to the desire for more general terminology. As of this writing, the deepest hierarchy has four levels, as exemplified by the relationships for **Loran charts**.

Loran charts

BT Nautical charts

Nautical charts

BT Maps

Maps

BT Cartographic materials

Cartographic materials

[broadest term]

Associative Relationships

The ANSI/NISO standard defines associative, or Related Term (RT), relationships as “terms that are neither equivalent nor hierarchical, yet the terms are semantically or conceptually linked to such an extent that the link between them should be made explicit in the controlled vocabulary, on the grounds that it may suggest additional terms for use in indexing or retrieval.” The standard goes on to say that terms exhibiting the

associative relationship may be from the same hierarchy or from different hierarchies.^[20]

A slightly more stringent approach is taken in LCGFT, where related terms are generally in the same discipline, and thus have the same “broadest term,” but they should not be related to each other if they are in the same subhierarchy. For example, **Inspirational radio programs** and **Religious radio programs** share the same BT, **Radio programs**, the broadest term for the discipline, and may be RTs. **Christian radio programs** and **Radio sermons** also share a BT, **Religious radio programs**, but may not be RTs because the shared BT is not the broadest term for the discipline.

As a matter of practicality, terms may not display an associative relationship if they begin with the same word or word stem because the terms generally file near each other, making an explicit RT relationship superfluous. Although one might consider Western novels, films, radio programs, and television programs to be conceptually linked, they alphabetize one after the other and thus RTs are unnecessary.

Scope Notes

Scope notes (SN) are provided to assist users in knowing if the term covers the materials in which they are interested and also to help catalogers maintain consistency in the way that terms are assigned to works. Typically, scope notes are provided if users may be unfamiliar with the term, or if the term is defined in multiple ways in reference sources, making it necessary to explain how it is defined in LCGFT. Since most general users of libraries probably do not know what a concordat is, it is defined as follows:

Concordats

SN Agreements between a government and the Roman Catholic Church.

Scope notes are also included when it is necessary to define one term in contrast to another. These are called contrasting scope notes, and appear on both of the terms being defined. Since the difference between disaster films and survival films may not be immediately apparent, definitions are provided as follows:

Disaster films

SN Films that feature a man-made or natural calamity that places people in imminent danger. For films that feature individuals or groups struggling for their lives in a harsh setting see Survival films.

Survival films

SN Films that feature individuals or groups struggling for their lives in a harsh setting. For films that feature a

man-made or natural calamity that places people in imminent danger see Disaster films.

Most terms in LCGFT do not have scope notes because the meanings of the terms are self-evident. Sometimes terms are part of the collective consciousness, or their meanings are clear without a note (e.g., **Administrative regulations; Christmas films; Documentary television programs**). In some cases, notes are not provided because doing so could unduly limit the term’s usefulness. Let’s say, for example, that a scope note for the term **Detective and mystery films** listed five characteristics indicative of such a film but an individual film exhibited only three of those characteristics. The term could not be applied to that film, even if it would be obvious to anyone viewing it that it was in fact intended to be a film of that genre. Not including a scope note therefore allows the cataloger to apply the principle of “I know it when I see it,” instead of having to apply case law to creative works.

APPLICATION

The rules for assigning terms from LCGFT are straightforward: one term is assigned to bring out each genre or form applicable to a work or expression; the terms are not subdivided; and other vocabularies are used to describe other aspects, such as subject matter.

As discussed earlier in the section on authorized terms, each LCGFT term represents a single concept. The significant genre/form aspects of a work or expression are brought out by assigning multiple terms in separate fields, not by combining terms through the use of subdivisions. An atlas that includes both topographic and physical maps is therefore assigned three terms: **Topographic maps; Physical maps; and Atlases**.

In the case of moving image works, where the manifestation being cataloged may differ dramatically from the original release parameters, the LCGFT policy states that the original parameters should be used if known. A DVD of a two-hour long three-dimensional adventure film originally released in theaters, for example, is assigned the terms **Action and adventure films** along with **Feature films** (defined as films at least 40 minutes in length)^[16] and **3-D films**. In addition, the rules for the application of genre/form terms for moving images state that the term **Fiction films** should also be assigned.^[21] The fact that the manifestation is a DVD is represented in the descriptive portions of the bibliographic record rather than through a term from LCGFT.

If that DVD also includes a fifteen-minute behind-the-scenes documentary on the making of the film, and the documentary is considered significant to the users of the library or archive, then the LCGFT terms **Documentary films** and **Short films** may also be included, along with

Nonfiction films.^[21] In the same way, interviews with the actors may be brought out with the term **Filmed interviews** and **Nonfiction films**.

DVDs are sometimes manifestations of television programs. According to LCGFT policy, the original release parameters should be observed, here, too. A DVD containing season 8 of a popular animated sitcom should be assigned **Situation comedies (Television programs)** and **Animated television programs**, along with **Fiction television programs**. Likewise, a DVD of a suspenseful made-for-TV movie should be assigned the terms **Made-for-TV movies; Thrillers (Television programs);** and **Fiction television programs** because the work was originally intended to be broadcast on television.

As of yet, there are no rules governing the number of genre/form terms that may be assigned to an individual resource. Generally speaking, the goal is to assign a term for each genre and form that is considered significant for the users. The preference is therefore to assign more specific LCGFT terms rather than fewer terms that are more general. Assuming that full access is considered necessary for the users being served, a compilation of legal instruments that includes contracts, affidavits, charters, and legal memorandums will generally be assigned a specific heading for each of those forms: **Affidavits; Charters and articles of incorporation; Contracts;** and **Legal memorandums**. The BT of each of those terms is **Legal instruments**, which, although valid, generally would not be assigned unless access to the specific forms in the compilation was not considered necessary.

The option to choose the level of access necessary for an individual user population—the scalability of the vocabulary—is made possible by the strict hierarchies in LCGFT. Librarians and archivists can choose how narrowly the genres and forms should be assigned. There is one exception to this principle, though: the broadest terms within a discipline should rarely—and perhaps never—be assigned to a resource. The exception is when a record is being created for a collection of disparate works of multiple genres and/or forms to which more specific terms cannot be assigned.^[16] Therefore, narrower terms are preferred.

So far, all of the discussion of application has related only to genres and forms. Subjects are equally as important in leading users to resources that are of interest to them. LCGFT is intended to be used in conjunction with subjects, not as a replacement for them. Subject headings should continue to be assigned according to the rules for the subject vocabulary being used. To show how this is done, let's expand upon a few of the examples given earlier.

An atlas that includes topographic and physical maps of the states of the United States, with the purpose of comparing the states to each other, could be assigned the array:

650 #0 \$a U.S. states \$v Maps.
655 #7 \$a Topographic maps. \$2 lcgft
655 #7 \$a Physical maps. \$2 lcgft
655 #7 \$a Atlases. \$2 lcgft

A popular animated sitcom that depicts children's experiences in elementary school could be assigned these *Sears* subject headings and terms from LCGFT:

650 #7 \$a School children. \$2 sears
650 #7 \$a Elementary education. \$2 sears
655 #7 \$a Situation comedies (Television programs) \$2 lcgft
655 #7 \$a Animated television programs. \$2 lcgft
655 #7 \$a Fiction television programs. \$2 lcgft

The suspenseful made-for-TV movie that depicts a woman being stalked would be assigned this array of LC subject headings and LCGFT terms:

650 #0 \$a Stalking \$v Drama.
655 #7 \$a Made-for-TV movies. \$2 lcgft
655 #7 \$a Thrillers (Television programs) \$2 lcgft
655 #7 \$a Fiction television programs. \$2 lcgft

Finally, the compilation of legal instruments discussed above might have high-tech firms based in Virginia as its collocation point. The array, using LCSH and LCGFT, might be

650 #0 \$a High technology industries \$z Virginia.
655 #7 \$a Affidavits. \$2 lcgft
655 #7 \$a Charters and articles of incorporation. \$2 lcgft
655 #7 \$a Contracts. \$2 lcgft
655 #7 \$a Legal memorandums. \$2 lcgft

Or, if less specific genre/form access is determined to be adequate,

650 #0 \$a High technology industries \$z Virginia.
655 #7 \$a Legal instruments. \$2 lcgft

RELATED DEVELOPMENTS

The genre/form projects triggered a reexamination of other LC subject headings that provide access to what something is instead of what it is about. Treated as form headings in LCSH, these subject headings are neither genres nor forms and are thus excluded from LCGFT. However, they remain valuable access points that indicate intended audience (e.g., **Children's poetry**), ethnicity, nationality, or other characteristic of the creator(s) (**Short stories, Swazi; Italian fiction; Airline pilots' writings**),

and time period of creation (**Renaissance drama**). In the case of music, the medium of performance is also vitally important, and in LCSH is sometimes provided in dedicated headings (**Flute and accordion music**) and other times is described with hybrid headings that contain both the genre or form and the medium(s) of performance (**Trios (Bagpipe, hurdy-gurdy, continuo)**).

There was a pressing need to determine how access to these characteristics will be provided going forward, since headings of this type are most prevalent in the disciplines of literature and music. Once the LCGFT terms for literature and music are fully implemented, none of the form subject headings should be used to describe what a work or expression *is*. In the discipline of literature, the form subject headings will continue to be valid, but will be assigned only to works about the “form.” For music, subject headings such as **Trios (Bagpipe, hurdy-gurdy, continuo)** will be cancelled from LCSH since they exist solely as form headings, and are never used as subjects (i. e., for works *about* trios for bagpipe, hurdy-gurdy, and continuo).

The Music Library Association (MLA) and LC’s Policy and Standards Division closely examined various options for provision of medium of performance and determined that the best approach was to create a separate thesaurus for those terms. MLA and PSD partnered to develop the *Library of Congress Medium of Performance Thesaurus for Music* (LCMPT), the initial terms for which were approved in 2014.

Since medium of performance is neither a subject nor a genre or form, it was determined that these terms should not be coded in the 6xx block of the bibliographic record. Instead, MARBI approved an MLA proposal requesting that the 382 field, which was originally defined for the *Resource Description and Access* (RDA) medium of performance element, be made repeatable and used for both RDA and LCMPT—for description and for access, respectively.^[22] The hope is that in the future the RDA instructions and the rules for application of LCMPT can be coordinated so that one instance of the field can serve both purposes.

In 2013, MARBI also approved a separate proposal for MARC 21 authority fields for medium of performance vocabulary: field 162 for the authorized term and 462, 562, and 762 for references.^[23]

The SAC Subcommittee on Genre/Form Implementation (SAC-SGFI) and PSD examined the necessity of access for intended audience creator/contributor characteristics, and made two MARBI proposals for new fields. The proposals were approved by MARBI in January 2013.

The first proposal provided for intended audience through the creation of field 385 in both the bibliographic and authority formats. In the authority format, the field will be available for use in work and expression records.^[24] These fields will not only permit access to works for age- or educational-level groupings, but also to

disability, occupational, gender, and ethnic groups, among others, thereby providing much more specific access than is currently available in library catalogs.

The second proposal was very similar to the first. It requested field 386 for creator/contributor group categories. Now approved for use in bibliographic records and in authority records for works and expressions,^[25] it will also provide more access than was traditionally available in library catalogs.

In early 2014, PSD was authorized to develop another new controlled vocabulary, entitled Library of Congress Demographic Group Terms (LCDGT). Terms from LCDGT will be assigned to bring out the creators/contributors and the intended audiences of works and expressions^[27] and will be assigned in the 385 and 386 fields in bibliographic records and in authority records for works and expressions. The first 400 demographic group terms were approved in June, 2015.^[28]

It can also be important to access resources by the time period in which they were created. To that end, SAC-SGFI submitted a proposal that requested new coding for the existing field 046 (Special Coded Dates) in both the bibliographic and authority formats and for field 648 (Subject Added Entry—Chronological Term) in the bibliographic format. In the case of the 046 field, subfields for the beginning and ending date of the original publication of an aggregate work were approved. In field 648, the first indicator was defined to enable the cataloger to indicate whether the field is being used to convey the time period depicted or the time period of creation. The 046 and 648 fields may both be provided in a single bibliographic record, or one may be preferred over the other.^[26] In either case, the fact that the resource being cataloged is an anthology of works from the Renaissance can be brought out as an access point. The next step is to determine best practices for the use of the new coding, and that conversation has just begun.

CONCLUSION

Genres and forms are often part of the collective consciousness of a society, and it is essential to provide access to them. Traditionally, access has been provided through subject analysis, but that practice poses both intellectual and technical problems. *Library of Congress Genre/Form Terms for Library and Archival Materials* (LCGFT) is a discrete vocabulary dedicated to terminology for genres and forms of works and expressions, and is intended to work in conjunction with subject vocabularies and descriptive elements to provide users with a full understanding of those works and expressions. The discussions surrounding LCGFT have also led to further developments in the access to other pertinent data, including musical medium of performance, the

characteristics of the creators and contributors and the intended audience, and the time period of creation of the work or expression.

Library of Congress Subject Headings (LCSH)

Janis L. Young

Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

Development of *Library of Congress Subject Headings* (LCSH) began in 1898 and the first edition was published in parts between 1909 and 1914. LCSH has undergone many changes over the years, so today's vocabulary—the most widely used subject vocabulary in the world—is quite different from what its initial developers envisioned. This article provides overviews of the current features of LCSH and the application of headings. It then discusses and evaluates several policy revisions made since the 1970s to take advantage of technology and to simplify cataloging. A final section describes several adjustments to LCSH that are being planned and executed, including those intended to increase LCSH's viability as linked data.

INTRODUCTION

Library of Congress Subject Headings (LCSH) is the most widely used subject vocabulary in the world. It is the model for many other vocabularies in English and other languages, and has been translated numerous times.^[1] As of the beginning of 2017, it included over 342,000 individually established headings,^[2] but catalogers can create untold more by combining main headings and subdivisions in specific ways.

This article will explain LCSH's scope, heading syntax, and syndetic structure before exploring several major policy changes that have occurred since the 1970s. When taken as a whole, those changes are so dramatic that the LCSH that entered the twenty-first century is quite different from the vocabulary that the initial developers envisioned over 100 years ago. Finally, the article will discuss current initiatives to take advantage of twenty-first century technology, including the need to make LCSH more viable as linked data.

SCOPE

LCSH is a multidisciplinary vocabulary that includes headings in all subjects, from agriculture to history, to education, literature, and military science. Ethnic groups, historical events and movements, building names, geographic features, and scientific theories are just some of the categories of headings represented in LCSH. LCSH is not complete unto itself; however, names of persons and corporate bodies, jurisdictions and quasi-jurisdictional entities, and titles can generally be assigned as LC subject headings, but are established in the LC/NACO Name Authority File (NAF) according to instructions contained in *RDA: Resource Description and Access* (p. xv).^[2]

There is no attempt at comprehensiveness. Subject headings are proposed as needed for new cataloging, due to literary warrant; a heading must be needed to describe a work before it can be proposed for inclusion. Every month, hundreds of proposals for new headings are vetted and approved by cataloging policy specialists in the Library of Congress' Policy and Standards Division. The specialists ensure that the proposals conform to the rules and structure of LCSH, including heading format, provision of references, and scope notes. The rules are contained in two sources: the introduction to LCSH^[2] and the *Subject Headings Manual* (SHM).^[3] An overview is provided below.

HEADINGS

LC subject headings may consist of a single word or a phrase. A one-word heading is usually a singular or plural noun. Singular nouns generally denote abstract concepts (e.g., *Philosophy*) while plural nouns typically indicate tangible objects that can be counted (*Restaurants*).

Phrase headings usually consist of an adjective and a noun and may appear in natural-language order (e.g., *Constitutional history*) or as an inverted phrase (*Literature, Modern*). Natural language is preferred with exceptions for certain categories of headings, such as those qualified by nationality (*Art, Swiss*) and some geographic headings (*Michigan, Lake*).

Other phrase headings include the conjunction "and," which may indicate topics that are almost always treated together (e.g., *Bolts and nuts*) or topics with a reciprocal relationship (*Culture and law*). Phrase headings may also consist of prepositional phrases (*Student evaluation of teachers*).

Headings sometimes include a parenthetical qualifier that clarifies the meaning of the heading. In the case of

Plates (Engineering) and *Plates (Tableware)*, the qualifier distinguishes among homonyms, while the qualifier in *Cooking (Peanuts)* provides context.

REFERENCES

Cross-references guide users to authorized headings that are of interest to them and are provided in the authority records for the headings. LCSH includes five types of cross-references: broader/narrower terms; related terms; see references, see also references, and general see references.

Broader and narrower terms (BT and NT) are reciprocal, meaning that they work in both directions. One can find a list of all of the established narrower terms under the entry for the broader term, and also find the broader term listed in the entry for the narrower term. The references are hierarchical, and each NT is a part of the concept represented in the BT. BT/NT references exhibit three types of relationships.

In a class/class member (a.k.a. genus/species) relationship, each of the narrower terms (the class members) is a member of the larger group: geriatricians and pediatricians are members of the class called *Physicians*.

Geriatricians
BT Physicians

Pediatricians
BT Physicians

Physicians
NT Geriatricians
NT Pediatricians

In the whole/part relationship, the each of the narrower terms is part of the whole: the endocardium and heart valves are parts of the heart.

Endocardium
BT Heart

Heart
NT Endocardium
NT Heart valves

Heart valves
BT Heart

The instance relationship brings together under one concept (the broader term) the individually named exemplars of that concept: Borax Lake and Donner Lake are both lakes in California.

Borax Lake (Calif.)
BT Lakes—California

Donner Lake (Calif.)
BT Lakes—California

Lakes—California
NT Borax Lake (Calif.)
NT Donner Lake (Calif.)

Some LC subject headings do not have a broader term. These “orphans” fall into one of several defined categories, including headings that are the broadest topic within a hierarchy, family names, and headings for geographic regions.

Related terms (RTs) are associative references and link two headings that are related to each other, but not hierarchically. Instead, they are mentally associated to such an extent that the alternative heading might be of interest to the user. The references are reciprocal and therefore appear in both entries. When one thinks of boats and boating, one often thinks of sailing.

Boats and boating
RT Sailing

Sailing
RT Boats and boating

See references, indicated with the notations UF (Used For) and USE, provide links from synonyms and alternate forms of the heading to the authorized heading. Two of the most common alternate forms are inversions to bring a significant word into the initial position and variant phrasings or spellings of the heading. Like BT/NT and RT references, UF/USE references are reciprocal.

Callirhoe
UF Callirrhoe (Plants) [alternate spelling]
UF Mallows, Poppy [inversion]
UF Poppy mallows [common name synonym]

Callirhoe (Plants)
USE Callirhoe

Mallows, Poppy
USE Callirhoe

Poppy mallows
USE Callirhoe

Two other classes of cross-references alert users to whole categories of headings instead of to an individual heading.

See also (SA) references appear under authorized headings, and point either to subdivisions that may be relevant to the user's needs, or to headings that employ different wording. The SA reference under *Bombing, Aerial* indicates that the subdivision—*Aerial operations* is assigned after headings for individual wars. The example provided, *World War, 1939-1945—Aerial operations*, helps users who search under *Bombing, Aerial* but who are specifically interested in bombing during the Falkland Islands War to understand that they may find materials of interest under the combination *Falkland Islands War, 1982—Aerial operations*.

Bombing, Aerial

SA subdivision—Aerial operations under individual wars, e.g., *World War, 1939-1945—Aerial operations*

The reference under *Heat* points to headings that begin with the word “thermal.” *Thermal analysis, Thermal batteries*, etc., do not have a formal relationship to the heading *Heat*, but may nonetheless be of interest to the user.

Heat

SA headings beginning with the word Thermal

General see references are not headings but provide information on consistently used terminology and sometimes replace UF references to individual headings. The following example indicates that LC subject headings for mountains never include the abbreviation “Mt.” Instead, the word “Mount” should be searched.

Mt. . . .

USE subject headings for place names that include the word “Mount,” e.g., *Fuji, Mount (Japan)*

General see references may also provide information about subdivisions. The general see reference *Office, Resignation from* indicates that the subdivision—*Resignation from office* is used under personal names. Therefore, the heading *Nixon, Richard M. (Richard Milhous), 1913-1994—Resignation from office* may appear in the catalog. (For more information on subdivisions, see below.)

Office, Resignation from

USE subdivision Resignation from office under names of individual persons

SCOPE NOTES

Scope notes also appear in some records for LC subject headings. Scope notes (SN) help users understand the meaning of the heading, and help catalogers assign the

heading consistently. Some scope notes, such as that for *Accessory apartments*, define only one heading.

Accessory apartments

SN Here are entered works on apartments that are subordinate in size, location, and appearance to their companion principal units.

Other scope notes contrast two or more closely related or somewhat overlapping headings and are reciprocal—they appear in all of the headings being defined. Here, there may be confusion over the difference between *Alpine regions* and *Alps Region*.

Alpine regions

SN here are entered works on higher regions of mountain systems that lie above the timberline and below the level of permanent snow. Works on the area that surrounds and includes the Alps are entered under Alps Region.

Alps Region

SN here are entered works on the area that surrounds and includes the Alps. Works on higher regions of mountain systems that lie above the timberline and below the level of permanent snow are entered under Alpine regions.

A third type of scope note provides instructions on application and are chiefly intended for cataloger use, but also assist users in finding materials of interest to them.

Depressions

SN Subdivided by date and, if worldwide, may be further subdivided by country, city, etc., for example, *Depressions—1929—United States*; *Depressions—1929—Illinois—Chicago*

SUBDIVISIONS

LCSH is a *pre-coordinated* system: catalogers combine main headings with subdivisions in order to include multiple concepts in a single heading, thereby “pre-coordinating” headings for the user. It is also *post-coordinated* because two or more subject headings are often assigned to an individual work. The headings within a single bibliographic record may exhibit both pre- and post-coordination: multiple headings may be assigned (post-coordination) and each heading may be subdivided (pre-coordination).

In traditional online catalogs, users generally browse the subdivided headings alphabetically, as was done in card catalogs. Users of those catalogs must have at least a basic understanding of the structure of LCSH so they can formulate effective left-anchored searches. In the new

generation of online catalogs and discovery systems there is usually an option to treat each LCSH subdivision as a separately indexed and displayable facet, allowing users to combine pieces from various subject headings. Faceting precludes the need for users to understand LCSH's structure, but also removes the context that subdivisions provide. Regardless of whether a catalog provides traditional left-anchored browsing of subject headings or a faceted interface, it is important to understand the types of subdivisions and the role that each plays within a subject heading string.

There are four categories of subdivisions: topical, chronological, geographic, and form.

Topical subdivisions limit the main heading to a particular subtopic (e.g., *Religion in public schools—Law and legislation*; *Theaters—Stage-setting and scenery*; *Virginia—Antiquities*).

Chronological subdivisions limit the heading to a particular period of time and are often preceded by the topical subdivision—*History*. They usually consist of a date span, and may include a descriptive phrase (e.g., *Furniture—Japan—History—Edo period, 1600–1868*; *Libraries—History—To 400*; *Philosophy, American—20th century*; *United States—Foreign relations—2001–2009*).

Geographic subdivisions limit a heading to a particular place, and are derived from authorized headings for jurisdictions and quasi-jurisdictions established in the NAF as well as geographic features established in LCSH. Only headings representing topics that can exist in a particular place, or that can be discussed in relation to a place, may be subdivided geographically. They are indicated with the notation (May Subd Geog). For example, the heading *Hotels* may be subdivided geographically, as indicated by the entry:

Hotels (May Subd Geog)

The following combinations are therefore possible:

Hotels—Egypt—Cairo.

Hotels—Europe.

Hotels—Finland.

Hotels—United States.

The combinations in the above example demonstrate the principle of indirect subdivision. Regions larger than countries, including continents, are used directly after topics, as are names of countries. For places within a country, the name of the country is interposed before the name of the place. There are three exceptions to the general rule: Canada, the United States, and Great Britain. For those countries, the provinces, states, and constituent countries, respectively, are assigned without first assigning the country. The name of the province, state, or constituent country is interposed before the name of a local place.

Hotels—Alberta.

Hotels—Alberta—Edmonton.

Hotels—England.

Hotels—England—London.

Hotels—Florida.

Hotels—Florida—Miami.

Some topical subdivisions can also be subdivided geographically. Geographic subdivision is always provided as far to the end of the heading string as possible. If the main heading and the topical subdivision can both be geographically subdivided, the geographic subdivision is assigned after the topical subdivision; if only the main heading can, the subdivision is interposed. This can sometimes lead to random-looking orders of subdivisions, as shown in this example.

Authorized headings:

Automobiles (May Subd Geog)

Automobiles—Accounting

Automobiles—Batteries (May Subd Geog)

Headings with geographic subdivision:

Automobiles—Batteries—Wyoming.

Automobiles—Wyoming.

Automobiles—Wyoming—Accounting.

Topical, geographic, and chronological subdivisions indicate the topic of the material being cataloged. Form subdivisions are quite different and indicate what the material is: a dictionary or an encyclopedia, for example. They almost always appear as the last element of a subject heading string (e.g., *London (England)—Guidebooks*; *English language—Dictionaries*; *United States—History—War of 1812—Encyclopedias*).

Free-Floating and Pattern Subdivisions

Some subdivisions are specifically established for use under a particular heading and are printed in LCSH, but most [*heading*]—[*subdivision*] combinations are created by catalogers in building-block fashion according to rules provided in the SHM. The topical, form, and chronological subdivisions that can be added to headings are called free-floating subdivisions.

The SHM includes lists of free-floating subdivisions that may be assigned to particular categories of headings as needed. There are, for instance, lists of subdivisions that are used under names of persons, classes of persons, and bodies of water. Each list is self-contained and is prefaced with a statement indicating the types of headings to which the subdivisions in the list may be appended.

Free-floating subdivisions may be combined with headings fitting the category, as long as they are appropriate and there is not a conflict. For example, the subdivision—*Navigation* may be assigned under bodies of water so the

heading *Mississippi River—Navigation* may be assigned, although it is not specifically established and thus does not appear in LCSH. The subdivision —*Psychology* may be used under classes of persons, so one would expect that it can be used under *Children*, a class of persons. However, the combination *Children—Psychology* is a UF reference to *Child psychology*, so there is a conflict and *Child psychology* is used instead. Finally, some free-floating subdivisions that are technically valid under a particular heading are intellectually inappropriate. For example, the subdivision —*Coronation* may be used under names of persons, but it would not be appropriate under *Washington, George, 1732–1799* because Washington was inaugurated, not coronated.

Pattern subdivisions are a special type of free-floating subdivision and are assigned in the same manner. The difference is in the way they are established. Free-floating subdivisions appear in lists but may not ever be established under particular headings. Pattern headings appear in lists, too, but are also established after the “pattern” heading, which is a heading that is representative of the category. *Corn* is the pattern heading for the category Plants and Crops, for instance, so all of the subdivisions authorized for use under headings for plants and crops are established under *Corn*. Because the subdivided heading *Corn—Harvesting* is established, the headings *Spinach—Harvesting*, *Tomatoes—Harvesting*, and numerous others can also be created. In this way, subdivisions are established only once but are used many times.

Multiple subdivisions are another type of free-floating subdivision. They appear in LCSH under individual headings and are indicated with square brackets and the abbreviation “etc.” as in the example *Future life—Buddhism, [Christianity, etc.]*. The subdivision suggests the creation of analogous subdivisions, which are free-floating. Due to the multiple, *Future life* may be subdivided by any religion (e.g., Christianity, Islam, Judaism).

ASSIGNMENT OF HEADINGS

Headings are assigned to represent the overall contents of the work; LC practice is to assign headings only for topics that comprise at least 20% of the work.^[4] Some works are adequately cataloged with only one subject heading. Others may be assigned a maximum of 10 in order to bring out complex or compound topics that cannot be expressed with a single heading.

Headings assigned to a work are as specific as the work itself. A general work on chemistry would be assigned the heading *Chemistry*, while a work on optical isomers, a concept in chemistry, would be assigned *Optical isomers* and not the broader heading. Likewise, an encyclopedia of the ethnic groups of Africa would be assigned the relatively general heading *Ethnology—Africa—*

Encyclopedias, while a work on the marriage customs of the Xhosa people from South Africa would be entered under the more specific *Xhosa (African people)—Marriage customs and rites—South Africa*.

More information on these general principles, and also the rules on heading assignment for specific types of materials, is provided in the SHM.^[3]

LCSH'S PAST AND PRESENT

LC subject headings and the policies governing their application have developed over more than one hundred years. LCSH's core vocabulary was the 1895 American Library Association publication entitled *The List of Subject Headings for Use in Dictionary Catalogs*. LC acquired copies of the ALA publication and interleaved them with blank pages. Beginning in 1898, headings that were assigned by LC catalogers were checked off, and new or revised headings were written on the blank pages. Those headings became the first edition of *Subject Headings Used in the Dictionary Catalogues of the Library of Congress*, which was published in parts between 1909 and 1914 and was kept up to date by supplements and by new editions. The vocabulary acquired its current title in 1975, when the eighth edition was published as *Library of Congress Subject Headings*.^[5]

Many generations of librarians have maintained LCSH as theories of vocabulary construction have come and gone, knowledge of users' information-seeking behavior has increased, and technology has changed. The vocabulary therefore reflects the varied philosophies of the times and of the catalogers who have contributed headings (p. viii).^[5] Variations in the formulation of headings can usually be attributed to policies in force at the time the headings were created. As Richard S. Angell phrased it in the introduction to the 6th edition, “The list is the product of evolutionary forces, among them the growth of the Library's collections, semantic change, and varying theories of subject heading practice over the years. As a consequence the list is, at any point in time, an accurate reflection of practice but not a complete embodiment of theory.”^[6]

Some existing headings were revised to reflect new “theories of subject heading practice,” but revisions were quite labor intensive in the days of the card catalog and had to be carefully considered. In many libraries, cancelled headings were erased from cards, new headings typed, and the cards refiled; at LC, new card sets were ordered and filed as superseded ones were pulled.^[7]

Large changes were massive undertakings due to the sheer size of LC's main catalog. The cancellation of the outdated heading *European War, 1914–1918* in favor of *World War, 1914–1918*, for example, was postponed until the card catalog was closed in 1981, meaning that cards would not need to be revised, but—perhaps most importantly—tens of thousands of cards filed between *European. . . and World. . .* did not have to be shifted.^[7]

The adoption of an automated system for LCSH in 1985 dramatically changed LC's ability to revise the vocabulary. Headings and references could be updated more easily, making it feasible to adopt some elements of thesaural structure. The past three decades have been a time of significant change for LCSH as technological advances have impacted every aspect of vocabulary development and maintenance. The utilization of twenty-first-century technology promises to bring further notable alterations in the way that LCSH is maintained and assigned.

This section will explore the ways that LCSH has changed over time by highlighting several watershed policy decisions. Some of the revisions occurred in the 1970s, but the pace of change significantly increased after 1985.

Scope

For most of LCSH's first hundred years, its scope was determined by LC's collections, which are strong in the humanities and social sciences; coverage of those disciplines is therefore particularly deep in LCSH. On the other end of the spectrum, coverage of medicine and agriculture is less granular. LC maintains relatively superficial collections in those areas, because each has a U.S. national library dedicated to it: the National Agricultural Library and the National Library of Medicine, respectively.

During the 1980s, advances in technology made it feasible for LC to routinely accept proposals for new and revised headings from other libraries. As a result, the Cooperative Subject Cataloging Project was born in 1983.^[8] It was renamed the Subject Authority Cooperative Program (SACO) in 1994,^[9] and is now a formal arm of the Program for Cooperative Cataloging (PCC).^[10] Any library able to meet the contribution requirements may join SACO and propose headings needed for their own cataloging, and there are dozens of active members. Since member libraries collect in areas that LC does not, they are able to add depth and breadth to LCSH.

The growth of SACO has helped to provide more balance in LCSH, which has been charged with having an American or Western bias. One of LCSH's most vocal critics is Sanford Berman, who opined in 1971:

"In the realm of headings that deal with people and cultures—in short, with humanity—the LC list can only 'satisfy' parochial, jingoistic Europeans and North Americans, white-hued, at least nominally Christian (and preferably Protestant) in faith, comfortably situated in the middle- and higher-income brackets, largely domiciled in suburbia, fundamentally loyal to the Established Order, and heavily imbued with the transcendent, incomparable glory of Western civilization."^[11]

LC's collections have traditionally emphasized American and Western European topics, and LCSH reflected that focus. More recently, LC has stressed the acquisition of materials published in developing countries,^[12] and that

has likewise influenced the types of headings entering LCSH. In addition, SACO members regularly propose headings for geographic features and topics that are significant in other parts of the world, including those for ethnic groups, languages, historical periods, etc.

While SACO proposals clearly benefit LCSH overall by removing some of the inherent bias caused by the collection policies of a single library, they bring a different type of unevenness to the vocabulary. Since most SACO members are in the United States, the American bias of LCSH is in some ways increasing with regard to locally significant headings (e.g., ethnic groups, geographic features), even as ever-growing numbers of headings that are locally relevant to other countries are added. In addition, since proposals are driven by literary warrant and thus by collection development policies, some American SACO members with large local-interest collections propose numerous headings of local significance, while other SACO members are not as active in that respect. This leads to unevenness in coverage, even within the United States.

Heading Currency

Headings in LCSH are based on the terminology used in the work being cataloged and on language employed by reference sources at the time the heading was proposed.^[13] The assumption is that the terminology employed there will be most familiar to those who will look for materials on that subject. However, the English language and societal attitudes evolve constantly, so older headings need to be revised to the current terminology.

Some headings become outdated due to language shifts over time. For instance, the heading *Livestock factories*, which was added to LCSH in 1980, was revised to *Factory farms* in 2008. The heading *Cellular telephones* was approved in 1998 and revised in 2009 to the more common and informal *Cell phones*. While the traditional preference has been for scientific and formal terminology, as befits a large research library,^[14] LCSH is used in all types of libraries and also on the Semantic Web. It therefore behooves LC to move toward less formality when possible. No example is clearer than the 2007 deprecation of the heading *Mensuration* in favor of its commonly used synonym, *Measurement*.

Some biased language results from contemporary scholarship. Reference sources from decades ago were often politically incorrect by today's standards, particularly when naming groups of people, including indigenous ethnic groups, and languages. In some cases, obviously pejorative headings have been cancelled from LCSH (e.g., *Yellow peril*). Others have been revised to reflect contemporary terminology. For instance, the heading *Cripples*, first included in 1919, was revised in 1957 to *Physically handicapped*, and then again in 2002 to *People with disabilities*, the latest iteration reflecting the preferred "people first language" that emphasizes the person and not the disability.^[15]

Not every situation is this cut-and-dried, though, and names of ethnic groups pose particular problems. Some members of a group may consider the term used in the heading to be pejorative because it is the “colonialist” or ethnocentric name. That same term may have been adopted by other members of the group, who use it with pride. In those cases, general encyclopedias are consulted and the heading is based on the terminology found there, on the principle that it is probably the terminology that most users will employ.

Because of such disagreements, and because it is impossible to comprehensively review LCSH, it is unlikely that all of the headings will ever be considered completely current and unbiased. However, LC’s attempts to remedy the problems have not gone unnoticed. Stephen A. Knowlton analyzed actions taken on the 225 headings that Berman considered problematic in 1971. Knowlton found that by 2005, 88 had been changed as suggested and 54 were revised to partially reflect Berman’s views. Knowlton concluded, “It appears that bias in subject headings, while a continuing source of concern, has been addressed in a serious manner by the compilers of LCSH. The main biases found in this study are the persistence of the assumption that unglossed religious headings refer to Christian topics, and [the continued existence of] unglossed terms related to United States history and geography, which may simply be confusing to users outside the U.S.”^[16]

Heading Syntax

Although natural-language headings are preferred, inverted topical headings (e.g., *Conjunctivitis, Infantile*) have always existed. Headings were inverted in three situations: when users were considered more likely to search under the noun instead of the adjective denoting language, ethnic group, or nationality; when it was desirable to bring the noun into the first position so the phrase heading would file with other headings beginning with the noun; and when the noun was also an independent heading and the adjective qualified it.^[17] The result of the inversions can be seen in the following array of headings:

Bridges
Bridges, Aluminum
Bridges, Arched
Bridges, Long-span

In libraries with large card catalogs, users might have had to walk quite a distance to follow references, so proximity was a service. Inverted headings are not nearly as useful in modern online catalogs, in particular because they can hinder keyword phrase searching. A user who searches for the phrase “long-span bridges” will not retrieve any works with the subject heading *Bridges, Long-span* and may therefore remain unaware of many pertinent works.

In 1983, the policy on inversion was updated so that most new headings are established in natural-language order. There are now only nine categories in which inverted topical headings are established.^[18] In terms of the number of new headings, the most common category is those that are qualified by ethnic group, language, or nationality (e.g., *Masks, Yoruba*; *Ballads, Hindi*; *Coins, Russian*).

Due to the policy revision, headings for similar concepts are sometimes formulated differently (e.g., *Toxicological chemistry* but *Chemistry, Forensic*). Existing inverted topical headings that do not fall into one of the nine categories are eligible for revision as time and workload permit.^[18] In 2008 and 2009, for example, the inverted headings for types of bridges, including those above, were revised to natural-language order, as were inverted headings qualified by a religion.

Revision of the inverted headings causes some tension. Most librarians probably agree that inverted headings inhibit access to some extent, but there is lack of agreement over whether the headings should be revised. Some see such revisions as “change for change’s sake.” Furthermore, lack of a global update capability in some integrated library systems makes it difficult for libraries to revise the headings locally. This fact illustrates the point that LCSH is used in so many libraries that even small adjustments in headings or policies can lead to upheaval. It can therefore be politically difficult to make adjustments, even when there is consensus that the adjustments are desirable.

Reference Structure

Early editions of LCSH were chiefly lists of authorized headings, arranged alphabetically. There were *see* references to the heading from synonyms and from some other terms that were not precisely synonymous with the heading, but there were not any hierarchical references. There were *see also* references, however, which were made to more specific subjects or to an application of the subject, and to “subjects which suggest themselves as likely to be of interest to the user” (pp. 13–14).^[17]

The second category of *see also* references involved very subjective judgments. Mary K. Pietris, a chief of the former Subject Cataloging Division when those guidelines were in force, put it this way: “If you were establishing the heading *Swimming*, should *Lakes* be a *see also* reference, because people often swim in them?”^[17] Two examples from the 5th (1948) edition^[19] are illustrative.

Irrigation

see also Alkali lands; Dams; Drainage; Dry farming; Reservoirs; Sewage irrigation; Water-storage; Windmills
refer from (see also) Agricultural engineering; Agriculture; Civil engineering; Drainage; Engineering; Hydraulic engineering; Reclamation of land; Reservoirs; Soils; Waste lands; Water-storage; Water-supply

Ocean currents

see also Bottle-charts; Guinea Current; Gulf Stream; Kuroshio

refer from (see also) Hydrography; Navigation; Ocean; Physical geography

Note that the references varied in specificity (e.g., *Engineering* in general and various specialties of engineering are all references for *Irrigation*). They also mixed types of entities, as can be seen in the see also references to both bottle-charts (a type of map) and individual named currents from *Ocean currents*.

The existing structure had become unworkable by the 1970s, leading LC staff to want to update it to a more thesaurus-like system.^[7] Several LC staff members attended a meeting sponsored by the Council on Library Resources (CLR) in 1982, which recommended that LC “edit the LCSH see also structure so that true hierarchical relationships are made explicit and both broader terms and narrower terms can be distinguished and retrieved.”^[20]

Planning for the automated subject system was underway by then, so LC was finally able to make the change. Proposals for new headings first included BTs and RTs in 1985, and hierarchical references first appeared in the 11th (1988) edition.^[21]

Although BTs, NTs, and RTs are characteristics of thesauri, their inclusion in LCSH did not make LCSH a true thesaurus. For instance, LCSH includes numerous synthetic headings (e.g., *Animals in motion pictures*), which are generally undesirable in thesauri.^[22] LCSH is therefore best described as a controlled vocabulary—a list of terms, each of which has an unambiguous, unique, and nonredundant definition and has been explicitly enumerated (p. 5).^[22] Since LCSH is not a thesaurus, the staff who developed its hierarchy did not consider themselves bound by the strict rules of thesaurus construction^[7] and LCSH’s structure is still imperfect when weighed against the ANSI/NISO standard for monolingual controlled vocabularies. An examination of three practical decisions made in the 1980s highlights the ways that LCSH differs from a thesaurus.

The first decision was to programmatically generate the BT and RT references from the references already present. When a heading appeared as both a *see also* and as a *refer from* (see also) reference in the same entry, as *Water-storage* does in the entry for *Irrigation* above, the heading became an RT. Other references were converted into BTs and NTs.^[23] This was an imperfect but necessary approach—imperfect because the new structure was predicated on the previous arbitrary system; necessary because it was impractical to intellectually reevaluate every existing heading to assign references. There have been efforts over the years to evaluate the references that were generated, but many still have not been reviewed for accuracy.

The second practical decision was to allow some categories of “orphan” headings, including headings that represent the broadest topic in a given category (e.g., *Science*), headings for geographic regions (*Europe*, *Western*) and family names (*Myers family*). Since they do not have obvious BTs, these headings’ lack of hierarchy is perhaps reasonable. Another category consists of inverted headings when the BT would match the first word or the entry phrase of the heading; the inversion allows for proximal browsing and the BT was therefore considered superfluous (*Painting*, *French* files after *Painting*, so the BT *Painting* is not made). Among other categories of orphans are certain ubiquitous prepositional phrase headings such as those in the form *[topic] in literature* (e.g., *Librarians in literature*), which were not provided with a BT in order to contain the size of printed editions of LCSH.

“Orphans” are generally not connected to any other heading in LCSH. This is detrimental in the linked data world, which is predicated on relationships. LC’s cataloging policy specialists have therefore added BTs to categories of headings as time permits. For instance, in 2012 the BT *Newspapers* was added to headings of the type *[nationality or language] newspapers* (e.g., *Albanian newspapers*).

The third practical decision with far-reaching implications involves BTs for headings that combine two concepts with either a preposition or the conjunction “and.” In each case, the BT reflects the second part of the heading. A BT reflecting the first part of the phrase heading was considered unnecessary because the phrase heading would be filed after the heading representing the first part. For example, *Art in education* and *Communication and education* each have the BT *Education*. Since the phrase headings are filed after *Art* and *Communication*, respectively, BTs from those two headings are not made.

This policy sometimes leads to references that violate the general policies for hierarchical references. For example, the BT for *Physicians as authors* is *Authors*, which follows the policy on prepositional phrases and accurately represents a class/class member relationship. On the other hand, the BT for *Children of celebrities* is *Celebrities*, which follows the policy on prepositional phrases but is intellectually invalid. Children of celebrities are not (necessarily) celebrities.

The LC staff who maintain LCSH continue to refine the syndetic structure of the existing headings. The structure of new headings conforms to thesaurus construction guidelines to the extent practical, given that new headings must be compatible with the legacy data.

Subdivisions

According to the ANSI/NISO standard on monolingual controlled vocabularies, pre-coordinated strings composed of a heading and one or more subdivisions exhibit three benefits. They provide a way to locate highly specific

information without having to search each term separately, group closely related terms together, and describe complex topics (p. 37).^[22]

The benefits of pre-coordination are clear, but the complexity and expense involved in assigning such headings cannot be denied. Since the 1970s, LC has made numerous policy changes in an effort to reduce the complexity and cost of subdivision practice. The 1990s were particularly active in this regard, due in large part to the implementation of recommendations made in 1991 by the LC-sponsored invitational Subject Subdivisions Conference (familiarily called Airlie House or the Airlie House Conference) and also the impact of automation.

This section briefly addresses three significant pre-Airlie House activities regarding subdivision policy, and then examines how the Airlie House recommendations were implemented by LC.

Pre-Airlie House Actions

Free-floating and pattern subdivisions: Every subdivision had to be specifically established with the heading for which it was intended to be assigned until 1974, when LC created lists of pattern and free-floating subdivisions.^[24] There were two primary benefits to the new practice. It decreased the average time and expense of cataloging a work at LC because fewer proposals were necessary. Catalogers in other institutions were also able to provide original subject cataloging more readily because they could combine headings and applicable subdivisions without waiting for LC to establish a specific combination.

Geographic subdivision: LCSH originally employed two methods of geographic subdivision. Some topics were subdivided directly by city (e.g., *Art—Paris*) and others were subdivided indirectly through the country (*Reformation—France—Paris*) (p. 2-3).^[17] To simplify practice and provide more predictability for users, in 1974 LC began to move toward always using indirect geographic subdivision. In November 1976, indirect geographic subdivision became standard for all topical headings.^[25]

Subject Cataloging Manual: Subject Headings: The SCM:SH, which described policies for proposing and assigning headings, was originally an in-house manual for LC catalogers, but library school faculty who taught LCSH and catalogers who wanted to follow LC policy lobbied LC to publish it. LC agreed, and the preliminary edition was published in 1984.^[26] The manual has gone through several editions and was retitled the *Subject Headings Manual* (SHM) in 2008. It is kept up to date with quarterly updates. In 2013, the Policy and Standards Division began to provide it freely on LC's website, and it is also available through Cataloger's Desktop, LC's subscription-based online documentation service.^[27,28]

Publication of the SCM:SH was significant because "For the first time, 'outside' catalogers were able to read

the same memoranda, or instruction sheets, available to LC catalogers, and thus acquire the opportunity to become more consistent and improve the quality of the LCSH strings that they assigned to original-cataloging records for the bibliographic utilities."^[29]

Airlie House Recommendations

The first Airlie House recommendation was to standardize the order of subdivisions for topical (not name or geographic) headings to *[topical]—[geographic]—[chronological]—[form]*.^[30] The suggested order was adopted in 1992, with some variations to permit the inclusion of a topical subdivision.^[31,32] There was community disagreement, though, over whether the standard order would best serve the user in certain areas, such as art, literature, and history, so headings in those categories were not updated.^[8] There is still progress being made, however; in 2008, for example, the placement of chronological subdivisions in architectural headings was revised to remove an exception to standard practice.^[33]

The placement of the geographic subdivision had the most impact on the overall order of subdivisions, and policies were adjusted to improve consistency. Previously, if the work prompting a proposal for a topical heading did not have a geographic focus, there was no provision made for geographic subdivision. Another proposal to add geographic subdivision would be made when warranted. This meant that many headings for which geographic subdivision was intellectually reasonable could not be so subdivided. This led to unpredictable orders of subdivisions, so since 1992 all proposals for topical headings and topical subdivisions that could have a topical orientation do include provision for geographic subdivision.^[31,34] In addition, existing headings have been marked (*May Subd Geog*) on a case-by-case basis.^[8]

To enable more headings to follow the standard order of subdivisions, LC also cancelled 79 topical subdivisions used under names of places in favor of the more common *[topic]—[geographic]* formulation (e.g., *[place]—Industries* was revised to *Industries—[place]*).^[8]

LC programmatically generated over 78,000 "validation records" between 2007 and 2012 in response to the Airlie House recommendation that the authority file should contain records for *[topical heading]—[topical subdivision]* combinations, although the combinations would remain free-floating. Validation records are based on headings used over 20 times in LC's bibliographic database, the assumption being that frequently-used headings are probably formatted correctly.^[35] The records contain all of the subdivisions—topical, geographic, chronological, and form—used within a particular heading and are chiefly intended to enable computer validation of subdivided headings. They may also be searched in Classification Web, LC's subscription-based vocabulary service,^[36] and are freely available through LC's authorities

website.^[37] They are also included in LC's Authorities & Vocabularies linked data service,^[38] from which they may be freely downloaded in a variety of formats.

The conference also requested that relationships between headings and topical subdivisions be coded (pp. 7–8).^[30] This goal was partially realized in 1999 when authority records for the free-floating and pattern subdivisions were created; each record includes a MARC 21 “subdivision usage” field 073,^[39] which lists the SHM instruction sheet(s) in which each subdivision appears. The other half of the relationship is provided by 072 “subject category code” fields that appear in authority records for the headings and contain the number of the instruction sheet into which the heading falls.^[40] In the following example, the 072 and 073 fields link the heading, *Greybull River (Wyo.)*, with an appropriate subdivision —*Water rights*.

```
072 #7 $a H 1145.5 $2 lcsb
151 ## $a Greybull River (Wyo.)
073 ## $a H 1145.5 $z lcsb
180 ## $x Water rights
```

Subject policy specialists began to experiment with adding 072 fields to select proposals for new headings in 2012, and it quickly became clear that there are several challenges to full implementation. They will be addressed below, in the section on future directions.

The conference also made three recommendations regarding chronological subdivisions. First, it suggested that chronological subdivisions should relate to the content of the work and not to its publication date. In response, LC cancelled almost 200 subdivisions that were established under specific headings and referred to publication date. The second recommendation was to remove phrases from chronological subdivisions (e.g., revise *United States—History—Civil War, 1861–1865* to *United States—History—1861–1865*). LC partially implemented the recommendation by removing phrases from over 100 chronological subdivisions.^[8] Third, the conference recommended that the pros and cons of using free-form chronological subdivisions be considered (pp. 8–9).^[30] LC decided not to move in that direction. As stated in a 2010 report,

“LC has decided not to pursue the use of free-form date subdivisions, which would exactly correlate to the chronological focus of a work, instead of using general century subdivisions, which are generally much broader. Using free-form date subdivisions would inhibit collocation of like works since works on the same historical period may differ in the beginning and ending dates of coverage. In addition, free-form date subdivisions would be much more time consuming and difficult to apply since catalogers would have to closely examine each work to determine its exact chronological coverage, which might in fact be vague (e.g., the United States during the Progressive Era)” (p. 5).^[33]

Airlie House also recommended that LC investigate implementing a separate subfield for form subdivisions (pp. 9–10).^[30] LC consulted with the Subject Analysis Committee of the Association for Library Collections and Technical Services (part of the American Library Association), which agreed that it would be feasible to establish and assign a separate subfield code. Subfield \$v was approved by the Machine-Readable Bibliographic Information Committee (MARBI) in 1995 and implemented by LC in 1999.^[8]

To assist catalogers and provide for machine manipulation, Airlie House recommended that LC investigate including in authority records for geographic headings, the form in which the heading would be used as a geographic subdivision (p. 10).^[30] Like the subfield \$v used in the MARC 6XX fields, this recommendation required action by MARBI, which approved the 781 linking field in 1992.^[8,41] LC implemented the field in 1996, and entered into a cooperative project with OCLC to programatically add 781 fields to existing records for geographic names that were already established in the NAF. That project, in which over 83,000 name authority records were enhanced, was completed in 2006. A similar project to add 781 fields to geographic LC subject headings, undertaken in cooperation with Northwestern University, was completed in 2003 (p. 31).^[11] (There are some geographic name and subject headings that by policy cannot be used as geographic subdivisions. In those cases, a 781 field is not added, but a 667 field is. The note reads, “This heading is not valid for use as a geographic subdivision.”)

Finally, Airlie House recommended the simplification of subdivisions by removing “overly fine distinctions,” combining lists of free-floating subdivisions, and increasing consistency in syntax. The conference considered the changes to be “of such importance that they should be made in spite of possible disruptions to existing databases” (p. 10).^[30]

In response, the lists of subdivisions used under groups of Indians, domestic animals, and literary authors were merged into the lists for ethnic groups, animals, and personal names, respectively, and three other lists were discontinued outright. Finally, some lists were shortened by removing subdivisions that were specific to a particular heading and were therefore not actually free-floating.^[8,42]

There were also many dozens of changes to individual subdivisions. By 1996, over 75 subdivisions with similar meanings but different syntaxes were merged or discontinued. For example, the subdivision —*Terms and phrases*, which was used under legal topics, was merged into the subdivision —*Terminology*, which was used elsewhere in LCSH. The wording used in over 60 subdivisions was updated (e.g., the subdivision —*Preventive inoculation* was revised to —*Vaccination*). Over 250 [heading]—[subdivision] combinations were replaced by phrase headings, and 35 subdivisions were cancelled altogether.^[8] LC continues to examine subdivisions on a case-by-case basis

and revisions are made as necessary regardless of their impact on existing databases (p. 5).^[33]

FUTURE DIRECTIONS

LCSH is a living system that adapts (albeit slowly at times) to social and technological changes, so LCSH at the turn of the twenty-first century is quite different from that which was envisioned at the dawn of the twentieth. This section will address some additional adjustments that are being planned and executed to bring LCSH further into the twenty-first century's linked data world.

RDA: Resource Description and Access, which was implemented by LC in 2013, has already impacted the scope of LCSH. Until mid-2013, new headings for individual fictitious and legendary characters, mythological beings and deities, and named animals were established in LCSH; they are now established in the LC/NACO NAF because under RDA, those entities are considered to be persons.^[43] As the RDA Steering Committee continues its work relating to concepts, objects, events, and places, additional adjustments to LCSH will probably be necessary.

Also already impacting LCSH is the development of three new vocabularies by LC and several partner organizations. One of them is *Library of Congress Genre/Form Terms for Library and Archival Materials* (LCGFT), a multi-disciplinary thesaurus of terms that represent what something *is* rather than what it is *about*.^[44]

In some disciplines, most notably literature and music, LC subject headings have been used to describe both what something *is* and what it is *about*. For example, a collection of haiku would be assigned the subject heading *Haiku*, while criticism of haiku would be assigned the subject heading *Haiku—History and criticism*. In the future, a work that is haiku will be assigned a term from LCGFT, while criticism will continue to be assigned the subject heading. [For more information, see the article on LCGFT.] Some subject headings that are assigned only to works *of* a particular form are likely to be cancelled in the future.

An open question is whether LCGFT will eventually supplant LCSH form subdivisions, which could then be cancelled. Many of the form subdivisions previously used to describe cartographic materials (e.g., the subdivision *—Maps, Comparative*) have already been cancelled in favor of the corresponding genre/form term, but other form subdivisions remain valid.^[45]

The *Library of Congress Medium of Performance Thesaurus for Music* (LCMPT), which consists of terminology to describe the instruments, voices, etc. used in the performance of musical works, was implemented in early 2014. Terms are assigned in MARC 21 bibliographic field 382 and in the 382 field in authority records for works and expressions.^[46]

LCSH includes thousands of headings that describe the form and/or mediums of performance of musical works, such as *Bass clarinet and piano music* and *Sonatas (Trumpet and piano)*. Most of those headings are only used to describe works *of* music, not works *about* it, and will be cancelled after LCGFT terms for music are implemented alongside the medium of performance terms.

Some LCSH form headings describe the intended audience or creator of the work (e.g., *Children's stories*; *Airline pilots' writings*). Since they do not represent a form or genre, they are outside the scope of LCGFT, but they will no longer be assigned to works of literature after LCGFT terms for literature are implemented. The access they provide is nonetheless important, so in early 2014 LC's Policy and Standards Division was authorized to develop *Library of Congress Demographic Group Terms* (LCDGT). The terms in LCDGT are based primarily on LCSH's headings for classes of persons and ethnic groups, with some modifications, and are assigned to bring out the creators/contributors and the intended audiences of works. Terms are eligible for assignment in MARC 21 fields 385 (for audience) and 386 (for creators/contributors) in bibliographic records and in authority records for works and expressions.^[47]

Traditionally, a cataloger describing a sonata for clarinet and cello that was composed by an American woman would assign only the subject heading *Sonatas (Clarinet and cello)*. Now, catalogers can use LCMPT to explicitly indicate the mediums of performance (clarinet and cello), LCGFT to indicate the form (sonata), and LCDGT to indicate the characteristics of the creator (an American woman).

When these three vocabularies are fully implemented, LCSH will be more true to its title and describe the topics of works, as opposed to describing both forms and topics.

The 072 project, which was briefly discussed as an outcome of the Airlie House recommendations, shows promise for simplifying the application of LCSH. Machine-matching the 072 fields in authority records for headings to 073 fields in the authority records for free-floating subdivisions will allow both the automatic suggestion of subdivisions appropriate to the heading that is being assigned and the dynamic validation of full heading strings. When combined with the coding that indicates whether a heading may be geographically subdivided and the 781 linking fields in records for geographic headings, it should also enable the automatic generation of full heading strings on the Semantic Web. This last outcome is essential to the success of LCSH in the linked data environment, and particularly in BIBFRAME, which is intended to replace MARC.

Adding 072 fields to subject authorities is not straightforward; with few exceptions, the lists include subdivisions that cannot in fact be assigned to every heading fitting the category. For example, H 1100, Classes of Persons, includes some subdivisions that apply only to headings for occupational groups and types of employees, and

others that may be used only under sex and age groups. Since there are no headings under which all of the subdivisions in H 1100 may be used, records for the classes of persons headings cannot be enhanced.

This raises questions about the future of subdivision practice because the exceptions add complexity for catalogers and make reliable computer manipulation impossible. To rectify the situation, should some lists be cancelled? Each [heading]—[subdivision] combination that is currently free-floating would have to be individually established. Since some of the problematic lists are those that were merged, should they be split again? Should the lists remain essentially intact, but problematic subdivisions be removed and established under specific headings as needed? Or is there some other option?

Multiple subdivisions (e.g., *Asceticism*—[*Buddhism, Hinduism, etc.*]) must also be addressed. They are not headings but are coded as if they were, so in linked data they are treated as authorized headings. Should they be cancelled, requiring that all subdivisions that would formerly have been authorized by the multiple be individually established? Should MARC be modified to include coding indicating that the “heading” is in fact not a heading at all? Or should programming be developed that will allow computers to recognize multiple subdivisions based on their unique syntax?

CONCLUSION

Since the 1970s, LCSH has undergone numerous policy changes, many of them made possible by technological advances. To maintain LCSH's standing as the most widely used vocabulary in the world, LC staff and their constituents throughout the world not only must use technology as a tool to adapt to changing circumstances, but also must adapt LCSH to technology. Twenty-first-century questions and challenges need to be confronted head-on, while the work that was begun in the last century—adding headings for new concepts, updating existing terminology, and refining the syndetic structure—must also continue.

Library of Congress: History

John Y. Cole

Center for the Book, Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

The Library of Congress occupies a unique place in American civilization. Established as a legislative library in 1800, it grew into a national institution in the nineteenth century. In the first decades of the twentieth century, soon after it moved from the U.S. Capitol into its own spacious building, it became a leader among national libraries and one of the largest libraries in the world. Since World War II, it has become an international resource of unparalleled dimension. With the creation of the National Digital Library in the mid-1990s, it began to assume a new educational role.

INTRODUCTION: THE LIBRARY OF CONGRESS TODAY

The Library of Congress has grown immensely in size and influence since its sesquicentennial year in 1950, when the eminent librarian S. R. Ranganathan noted both its good fortune to have the U.S. Congress as its “godfather” and its role as “perhaps the most influential of the national libraries of the world.”^[1] Since 1950, its collections and staff have tripled and its annual appropriation has soared from \$9 million to \$613 million in fiscal year 2008. With collections totaling more than 138 million items, a permanent staff of nearly 3700, and national and international services unmatched in scope by any other research library, the Library of Congress is one of the world’s leading cultural institutions.^[2]

The diversity of the Library of Congress is startling. Simultaneously it serves as a legislative library and the major research arm of the U.S. Congress; the copyright agency of the United States; a center for scholarship that collects research materials in many media and in most subjects from throughout the world, with 460 languages represented in its collections; a public institution that is open without charge or restriction to everyone over the age of 16 and serves readers in 20 reading rooms; a government library that is heavily used by the executive branch and the judiciary; a national library service for the blind and physically handicapped; an outstanding law library, international in scope and service; one of the world’s largest providers of bibliographic data and products; a center for the commissioning and performance of chamber music; the home of the nation’s poet laureate; a national folklife center and veteran’s history project; a national center for promoting reading with affiliates in all 50 states and the District of Columbia; the organizer of the annual National Book Festival; the sponsor of exhibitions and of musical, literary, cultural, and educational outreach programs that reach across the nation and the world; a

major worldwide research center for the preservation and conservation of library materials; and, as its research base, more than 60 million manuscripts, 12 million photographs, and the world’s largest collections of maps, atlases, printed music, recorded music, motion pictures, and television programs.

Yet another new and important function had emerged by 2000, when Librarian of Congress James H. Billington informed the U.S. Congress that during the past few years the library had become a world leader in providing high-quality, free educational material in the revolutionary new world of the Internet.^[3]

More than 13 million items from the library’s American history collections (and those of its institutional partners) are available on the library’s Web site (<http://www.loc.gov>). The site also provides access to the library’s exhibitions, catalog data, and legislative and copyright information. With more than 93 million visits and 614 million page views in 2007, the site is among the most visited of all U.S. government Web addresses.

The library occupies three massive structures on Capitol Hill, near the U.S. Capitol. The Jefferson Building, opened in 1897, is a grand monument to civilization, culture, and American achievement (see Fig. 1 for a photograph of the Jefferson Building). The handsome, functional Adams Building opened to the public in 1939. The modern Madison Building, completed in 1980, is by far the largest of the three structures. Construction of storage facilities for paper-based collections continues at Ft. Meade, Maryland, an hour north of the library; more than 2 million items are now located in the first two modules. In 2007, the library opened a \$155 million, 45-acre state-of-the-art audiovisual conservation center and home for its massive motion picture collections in Culpepper, Virginia. About 2 million researchers, scholars, and tourists visit the Library of Congress each year, and millions more use its bibliographic records, collections, and services through the Internet.

Fig. 1 Until 1897, when the Thomas Jefferson Building opened to the public, the Library of Congress was located in the U.S. Capitol. The monumental Jefferson Building evoked national pride and provided space for the development of national library services.

Since its creation, the Library of Congress has been part of the legislative branch of the American government. Although it is recognized as the *de facto* national library of the United States, it does not have that official designation. Nevertheless, it performs most functions carried out by national libraries elsewhere, and has become a symbol of American democracy and faith in the power of learning.

The broad nature of its goals and ambition are reflected in its recently adopted mission and vision statements.

The library's mission is to make its resources available and useful to the Congress and the American people and to sustain and preserve a universal collection of knowledge and creativity for future generations. We will foster a free and informed society by building, preserving, and providing resources for human creativity, wisdom, and achievement. We continually strive to place these resources at the fingertips of the American people, their elected representatives, and the world—for the mutual prosperity, enlightenment, and inspiration of all.^[4]

THE GROWTH OF A NATIONAL INSTITUTION, 1800–2000

How did a library established by the legislature for its own use become such an ambitious, multipurpose institution? Two points are clear: 1) the expansion of the Library's functions derives from the expansion of its collections; and 2) the growth of the institution is tied to the growth and ambitions of the United States itself. The development of the Library of Congress cannot be separated from the history of the nation it serves. Nor can it be separated from the philosophy and ideals of Thomas Jefferson (1743–1826), its principal founder.

The Library of Congress was established as the legislature of the young Republic prepared to move from

Philadelphia to the new capital city of Washington. On April 24, 1800, President John Adams approved legislation that appropriated \$5000 to purchase "such books as may be necessary for the use of Congress." The first books, ordered from London, arrived in 1801 and were stored in the U.S. Capitol, the library's first home. The collection consisted of 740 volumes and three maps.

On January 26, 1802, President Thomas Jefferson approved the first law defining the role and functions of the new institution. This measure created the post of Librarian of Congress and gave Congress, through the Joint Committee on the Library, the authority to establish the library's budget and its rules and regulations. However the 1802 law made the institution more than just a legislative library; the appointment of the Librarian of Congress was to be a presidential responsibility. The law also permitted the president and vice president to borrow books, a privilege that, in the next three decades, was extended to most government agencies and to the judiciary.

Three developments in the library's early history permanently established the institution's national roots. First, the Library of Congress was created by the national legislature, which took direct responsibility for its operation. Second, the Library of Congress was not only the first library but also the first national cultural institution of the U.S. government. Finally, in 1815, the scope of the library's collection was permanently expanded. The ideals, intellectual curiosity, and pragmatism of Thomas Jefferson were the key to this transformation.

Jefferson believed that the power of the intellect could shape a free and democratic society. It is not surprising that he took a keen interest in the Library of Congress and its development while he was president of the United States from 1801 to 1809. Throughout his presidency, he personally recommended books for the Library, and he appointed the first two Librarians of Congress. In 1814,

the British army invaded the city of Washington and burned the Capitol, including the 3000-volume Library of Congress. By then retired to Monticello, Jefferson offered to sell his personal library, the largest and finest in the country, to Congress to replace the destroyed collection. In 1815, Congress approved the purchase of Jefferson's 6487 volumes for \$23,940.

The library that Jefferson sold to Congress not only included over twice the number of volumes that had been destroyed, but it also expanded the scope of the library far beyond the bounds of a legislative library devoted primarily to legal, economic, and historical works. Jefferson was a man of encyclopedic interests, and his library included works on architecture, the arts, science, literature, and geography. It contained books in many languages, including French, Spanish, German, Latin, Greek, and Russian. Jefferson believed that the national legislature needed ideas and information on all subjects and in many languages in order to govern a democracy. Anticipating the argument that his collection might be too comprehensive, he argued that there was "no subject to which a member of Congress may not have occasion to refer."^[5]

The acquisition by Congress of Jefferson's library provided the rationale for the eventual expansion of the library's functions. The Jeffersonian concept of universality is also the rationale for the comprehensive collecting policies of today's Library of Congress. Jefferson and his friend and successor as president, James Madison (1809–1817) believed that democracy depended on the mutual support of "liberty and learning." The vast collections and varied services of the Library of Congress are founded on this belief.

The Library of Congress grew slowly but steadily after the purchase of Jefferson's books. A separate law department was approved in 1832, along with an appropriation to purchase law books under the guidance of the chief justice of the United States. Yet even as the library was beginning to grow, it appeared that the Smithsonian Institution might become the American national library. During the early 1850s, the Smithsonian's talented and aggressive librarian, Charles Coffin Jewett, tried to move the institution in that direction and turn it into a national bibliographical center. Jewett's efforts were opposed, however, by Smithsonian Secretary Joseph Henry, who insisted that the Smithsonian Institution focus on scientific research and publication. In fact, the secretary favored the eventual development of a national library at the Library of Congress, which he viewed as the appropriate foundation for such a government-wide institution. On July 10, 1854, Henry dismissed Jewett, ending any possibility that the Smithsonian might become the national library. Moreover, 12 years later, Henry readily agreed to the transfer of the entire 40,000-volume library of the Smithsonian Institution to the Library of Congress.

The Library of Congress suffered difficult times during the 1850s. The growing division between North and South

hindered the growth of government institutions. Furthermore, a serious fire in the Capitol building destroyed about two-thirds of the library's 55,000 volumes, including two-thirds of Jefferson's library. Congress responded quickly and generously: in 1852 a total of \$168,700 was appropriated to restore the library's rooms in the Capitol and to replace the lost books. However no plan was set forth for expanding the collection or the library's services. This philosophy was in keeping with the conservative views of Librarian of Congress John Silva Meehan (1829–1861) and Senator James A. Pearce of Maryland, chairman of the Joint Committee on the Library, who favored keeping strict limits on the institution's activities.

A few years later, the library lost several collection-building functions, further impeding its progress toward the comprehensive collection that Jefferson had favored. In the 1830s and 1840s, it had begun distributing public documents to institutions throughout the United States, and exchanging books and documents with foreign institutions on behalf of the U.S. government. A joint resolution of Congress in 1857 transferred responsibility for public document distribution to the Bureau of Interior and responsibility for international exchange of books and documents to the Department of State. Moreover, in 1859 all U.S. copyright activities were centralized at the Patent Office, which meant that the Library of Congress and the Smithsonian Institution no longer received the copies of books and pamphlets deposited for copyright that had been sent to each institution since 1846.

Ainsworth Rand Spofford and the National Library

The person responsible for transforming the library into an institution of national significance in the Jeffersonian spirit was Ainsworth Rand Spofford, a former Cincinnati bookseller and journalist who served as Librarian of Congress from December 31, 1864 to July 1, 1897 (see Fig. 2 for photographs of Spofford in the early and late stages of his Library of Congress long career). Spofford accomplished this task by permanently linking the legislative and national functions of the library, first in practice and then, through the reorganization of the library approved by Congress in 1897, by law. He provided his successors as Librarian of Congress with four essential prerequisites for the development of an American national library: 1) firm, bipartisan congressional support for the notion of the Library of Congress as both a legislative and a national library; 2) the beginning of a comprehensive collection of Americana; 3) a magnificent new building, itself a national monument; and 4) a strong and independent office of Librarian of Congress. Spofford had the vision, skill, and perseverance to capitalize on the Library of Congress's claim to a national role. Each Librarian of Congress since Spofford has built upon his accomplishments. Each has shaped the institution in different ways,

Fig. 2 (a) Ainsworth Rand Spofford, Librarian of Congress from 1864 to 1897, transformed the Library of Congress into a national institution that served the American public as well as Congress. The centralization of copyright at the library and the construction of the Jefferson building were his two greatest achievements. (b) Librarian Spofford at his desk in the badly overcrowded Library of Congress room in the U.S. Capitol in 1896, a year before the Library moved into its own building across the street from the Capitol. but none has wavered from the Jeffersonian belief that the democratic form of government depended on a comprehensive base of knowledge and information.

The idea of an American national library that Spofford revived had been languishing since Jewett's departure from the Smithsonian in 1854. Spofford and Jewett both recognized the importance of copyright deposit in developing a comprehensive collection of a nation's literature, yet there was a major difference in their views relating to a national library. Spofford never envisioned the Library of Congress as the center of a network of American libraries, a focal point for providing other libraries with cataloging and bibliographic services. Instead, he viewed it, in the European model, as a unique, independent institution—a single, comprehensive collection of a nation's literature to be used both by Congress and the American people. Congress needed such a collection because, as Spofford paraphrased Jefferson, “there is almost no work, within the vast range of literature and science, which may not at some time prove useful to the legislature of a great nation.” It was imperative, he believed, such a great national collection be shared with all citizens, for the United States was “a Republic which rests upon the popular intelligence.”^[6]

Immediately following the Civil War, American society began a rapid transformation that saw the expansion of the federal government. Spofford took full advantage of the favorable political and cultural climate and the increasing national confidence, to promote the library's expansion. He always believed that the Library of Congress was the national library and he used every

conceivable argument to convince others, particularly the Joint Committee on the Library and the rest of Congress.

In the first years of his administration Spofford obtained congressional approval of six laws or resolutions that ensured a national role for the Library of Congress. The legislative acts were: 1) an appropriation for the expansion of the Library in the Capitol building, approved in early 1865; 2) the copyright amendment of 1865, which once again brought copyright deposits into the library's collection; 3) the Smithsonian deposit of 1866, whereby the entire library of the Smithsonian Institution, a collection especially strong in scientific materials, was transferred to the library; 4) the 1867 purchase, for \$100,000, of the private library of historian and archivist Peter Force, establishing the foundation of the library's Americana and incunabula collections; 5) the international exchange resolution of 1867, providing for the development of the library's collection of foreign public documents; and 6) the copyright act of 1870, which centralized all U.S. copyright registration and deposit activities at the library.

The centralization of copyright activities at the library was Spofford's most impressive collection-building feat. The first U.S. copyright law was approved in 1790, but the practice of depositing items registered for copyright protection in libraries for the use of the public was not enacted until 1846, when the newly established Smithsonian Institution and the Library of Congress obtained the privilege. The Library of Congress received single copies of deposits from 1846 until 1859, and, thanks to Spofford, the practice began again in 1865. Enforcement was a problem, however, and Spofford

decided he needed the authority that would come from centralizing all registration and deposit activities at the library, consolidating functions then performed at the Patent Office and by the district courts. The copyright law of 1870 ensured the continuing development of the library's Americana collections, for it stipulated that two copies of every book, pamphlet, map, print, photograph, and piece of music registered for copyright be deposited in the library.

In its 1876 survey of the libraries of the United States, the U.S. Bureau of Education listed the rapidly growing Library of Congress and the Boston Public Library as the two largest libraries in the United States, with approximately 300,000 volumes apiece. By 1897, when the library moved from its overcrowded rooms in the Capitol into its spacious new building, its collections ranked first among American libraries in size and scope. Over 40% of its 840,000 volumes and at least 90% of its map, music, and graphic arts collections had been acquired through copyright deposit. Important items deposited through copyright included Civil War photographs by Mathew Brady and what today are considered the earliest motion pictures.

The copyright privilege not only built the library's collections, it also helped determine the direction of their growth. When the Library of Congress moved into its new building, separate custodial units were established for the special collections formed primarily through copyright deposit: maps, music, and graphic arts. Spofford's successors as Librarian of Congress hired subject specialists to develop these and other collections and persuaded Congress to begin appropriating substantial funds for the purchase of research materials for all collections. Today, copyright is still one of the Library's major acquisitions sources, but between the years 1865 and 1897, it played a crucial role in the development of the Library of Congress into a national institution.

The copyright law of 1870 had another major effect: it forced the construction of a building for the Library. Spofford foresaw this result almost immediately. In his 1871 *Annual Report*, he suggested that a separate building would be needed because of the increased receipts resulting from the new copyright law. The next year he presented a plan for such a building, initiating a task more challenging than he anticipated, and one that dominated the rest of his career as Librarian of Congress. In his 25-year struggle to make the building a reality, Spofford enlisted the support of many powerful public figures: congressmen, cultural leaders, journalists, and even presidents. The speeches and statements he elicited usually endorsed not only a separate building, but also the concept of the Library of Congress as a national library. In 1886, Congress finally authorized a new structure directly across the East Plaza from the Capitol. After further delays, construction began in earnest in 1889 and the new building, opened to the public in 1897, was immediately hailed as a

national monument. Now called the Thomas Jefferson Building, this imposing structure in the style of the Italian Renaissance, with its grand Main Reading Room at the center and exuberant interior decoration throughout, is an incomparable symbol of the importance of books and learning and their close relationship to democracy.

Spofford also deserves primary credit for creating the library's tradition of broad public service. In 1865, he extended the hours of service, so that the library was open every weekday all year long. In 1869, he began advocating evening hours, but this innovation was not approved by Congress until 1898. Finally, in the mid-1880s Spofford began lending books directly to the citizens of the District of Columbia if an appropriate sum was left on deposit, a procedure that ended in 1894, when preparations were started for the move into the new library building.

In 1896, just before the actual move, the Joint Committee held hearings about "the condition" of the library and its possible reorganization. The hearings provided an occasion for a detailed examination of the institution's history and functions and for a review of what new services the library might perform once it occupied the spacious new building. The American Library Association sent six witnesses, including future Librarian of Congress Herbert Putnam from the Boston Public Library and Melvil Dewey from New York State Library. Members of Congress listened with great interest to the testimony of Putnam and Dewey, who argued that the national services of the library should be greatly expanded. Dewey believed that the Library of Congress now had the opportunity to act as a true national library, which he defined as "a center to which the libraries of the whole country can turn for inspiration, guidance, and practical help, which can be rendered so economically and efficiently in no other possible way."^[7] Testimony at the 1896 hearings greatly influenced the reorganization of the library, which was incorporated into the Legislative Appropriations Act approved February 19, 1897, and effective on July 1, 1897. All phases of the library's activities were expanded and new administrative units were established.

Growth of Library Services

President William McKinley appointed a new Librarian of Congress to supervise the move from the Capitol and implement the new reorganization. He was John Russell Young, who held office briefly, from July 1, 1897, until his death in January 1899. A journalist and former diplomat, Young worked hard to strengthen both the comprehensiveness of the collections and the scope of the services provided to Congress. He honored Jefferson's influence on the library, placing Jefferson's books in a special room and commissioning a report on the Jefferson library that was published in the library's 1898 *Annual Report*.

Young used his diplomatic ties and experience to enlarge the Library's collections. In February 1898, for

example, he sent a letter to U.S. diplomatic and consular representatives throughout the world, asking them to send “to the national library” newspapers, journals, pamphlets, manuscripts, broadsides, and “documents illustrative of the history of those various nationalities now coming to our shores to blend into our national life.” He also asked for other categories of research materials, broadly described as “whatever, in a word, would add to the sum of human knowledge.”^[8] By the end of 1898, books and other materials had been received from 11 legations and 7 consulates.

Young skillfully guided the administrative reorganization. He made many important professional appointments, including Thorvald Solberg, the first register of copyrights, and catalogers J. C. M. Hanson and Charles Martel, who began reclassifying the collections after nearly a century of reliance on the classification scheme Thomas Jefferson provided to the library along with his books. Young also inaugurated what today is one of the Library’s best known national activities: library service for the blind and physically handicapped. In November 1897, the library began a program of daily readings for the blind in a special “pavilion for the blind” complete with its own library. In 1913, Congress stipulated the deposit in the library of the embossed books produced by the American Printing House for the Blind, and in 1931 a separate appropriation was authorized for providing books for the use of adult blind residents of the United States.

Herbert Putnam, Young’s successor, was appointed by President McKinley in the spring of 1899 and served as Librarian of Congress for 40 years, until the autumn of 1939 (see Fig. 3 for a photograph of Putnam in 1900). Asked to characterize the Library as he neared the end of his long career, Putnam penned the phrase “Universal in

Scope: National in Service.” If Spofford’s major contributions were the creation of a national collection and obtaining the building, Putnam was the librarian who did the most to extend the library to the American people. He created a systematic program of widespread public use that exists to this day, opening up the collections to scholars, the public, and other libraries. The first experienced librarian to serve as Librarian of Congress, Putnam established a working partnership between the Library of Congress and the American library movement. Rather than serving merely as a great national accumulation of books, a national library should, he believed, actively serve other libraries, as well as researchers and scholars.

In the quarter century before Putnam took office, a new structure of scientific and scholarly activity had evolved rapidly in the United States. Professional schools and new universities offering graduate work were established; numerous professional associations and societies came into existence; and the federal government became an active supporter of education, research, and scientific activity. By 1900, the age of the great library had arrived in America, characterized by huge book stacks, scientific cataloging and classification, and full-time professional staffs. The library’s new building symbolized this age and, as the first American library to reach 1 million volumes, the Library of Congress became the leader among American libraries. Putnam’s imaginative and decisive actions were approved by both the Joint Library Committee and the professional library community. Under his leadership, in 1901, the first volume of a completely new classification scheme, based on the Library’s own collections, was published; access to the Library was extended to “scientific investigators and duly qualified individuals” throughout the United States; an interlibrary loan service

Fig. 3 (a) Herbert Putnam, Librarian of Congress from 1899 to 1939, organized the library’s collections and services in the Jefferson Building and initiated bibliographic and loan services to libraries. This photographic portrait by Frances Benjamin Johnson was taken in 1900. (b) Librarian Putnam with young readers in the Main Reading Room of the Library of Congress about 1910.

was inaugurated; and the sale and distribution of Library of Congress printed catalog cards began.

The interlibrary loan system was an especially radical step, for it signaled the institution's transition from a national storehouse of books to a national laboratory for promoting the use of its collections. It required special legislation by Congress and approval was by no means assured. When asked to defend his position that books should be sent outside the District of Columbia, the Librarian explained that the risk was justified because "a book used, is after all, fulfilling a higher mission than a book which is merely being preserved for possible future use."^[9] It was a telling statement about the openness of American libraries and the spirit of cooperation that would weld them into a strong community. Moreover, Librarian Putnam's extension of the Library's classification and cataloging schemes to the rest of the nation helped "democratize" knowledge, nationally and internationally. It established bibliographic standards and encouraged cooperative endeavors among librarians and scholars. This sharing of the Library's "bibliographic apparatus," as Putnam called it, helped to systematize and communicate information about intellectual activity in America and propelled the Library of Congress into a position of international leadership among research institutions.

The development of the Library's collections into a nationally useful resource took many forms. To aid historical research, Putnam felt that the national library "should be able to offer original sources" about the national life. In 1903, he persuaded his friend and supporter, President Theodore Roosevelt, to issue an executive order that transferred the papers of many of the nation's founding fathers, including George Washington, Thomas Jefferson, and James Madison, from the State Department archives to the library's Manuscript Division. In 1904, the Library began publishing important historical texts from its collections, such as the *Journals of the Continental Congress*. Putnam felt the publication of such manuscripts was "not perhaps so much a service from us as a library as a duty from us as the custodians of original sources for American history."^[10]

As American influence and interests continued to expand in the twentieth century, Putnam looked abroad to build the Library's collections, boldly applying Jefferson's dictum that no subject was beyond the possible concern of Congress or the American people. The librarian was especially farsighted in acquiring research materials about other countries and cultures. In 1904, he purchased a 4000-volume library of Indica, explaining in the library's annual report that he "could not ignore the opportunity to acquire a unique collection which scholarship thought worthy of prolonged, scientific, and enthusiastic research, even though the immediate use of such a collection may prove meager."^[11] In 1906, he acquired the famous 80,000-volume private library of Russian literature owned by G. V. Yudin of Siberia, even sending a staff member to Russia to supervise the packing and shipping

of the books. The Schatz collection of early opera librettos was purchased from a German collector in 1908. Large and important collections of Hebraica, as well as Chinese and Japanese books, were also acquired. By 1926, the Library had obtained appropriated funds to send a permanent representative to Europe, stationed in Paris, to assist with acquisitions by developing contacts with dealers, collectors, scholars, and learned institutions.

In one notable instance, Congress took the initiative in building the Library's collections. In December 1929, despite the stock market crash 2 months earlier, Congressman Ross Collins of Mississippi proposed the purchase for \$1.5 million of the 3000-volume collection of early books assembled by collector Otto F. Vollbehr, which included one of three perfect existing vellum copies of the Gutenberg Bible. Congressman Albert Johnson of Washington, in the debate in the House of Representatives, maintained that "even if times are hard," Congress should purchase the collection because "it is all for the United States of America which is going to live we hope for thousands of years." Testifying before the Senate Library Committee, Putnam added his endorsement to the enthusiasm expressed by the House of Representatives. He reminded the committee that in 1815, the government paid Thomas Jefferson nearly \$24,000 for his library, and "in proportion to the resources of the country that sum was not much short of the million and a half" asked for the Vollbehr collection. Moreover, "what was true of that purchase is certainly true of the one before you. It would form "a most admirable substratum for a (greater) national library."^[12] The purchase was approved in 1930.

The Library's foremost function—support for legislative activities—was strengthened in 1914 when the Legislative Reference Service was established as a separate administrative unit. Its creation was a natural development in the Progressive era, when many people in business and public life advocated the "scientific" (and Jeffersonian) use of information to solve problems. Specialized library units for legislative research were established in several states, notably Wisconsin, during the first decade of the 1900s. Putnam responded to this movement and to hearings held by Congress under the leadership of Representative John M. Nelson and Senator Robert M. LaFollette of Wisconsin by creating the library's own Legislative Reference Service in 1914. The next year, he reported that the new service was anticipating questions from Congress on conservation bills, the merchant marine, the government of the Philippines, immigration, convict-made goods, railroad securities, federal aid in road making, publicity in campaign contributions, and a national budget system.

The Library as a Cultural Institution

While enhancing established functions Putnam also moved the library in new directions. The Library of

Congress Trust Fund Board Act of 1925, which enabled the institution to accept gifts and bequests from private citizens, was the major vehicle for the librarian's innovations. This legislation, which created a new cultural role for the library, was inspired by a proposal from private citizen, Elizabeth Sprague Coolidge. She offered an endowment to the library for promoting the appreciation and understanding of music, and to pay for a concert hall within the library building that would support the commissioning of new works of music and provide the chief of the Music Division with a generous honorarium. Prominent individuals such as James B. Wilbur, Archer Huntington, John D. Rockefeller, Gertrude Clarke Whittall, and many others soon joined Mrs. Coolidge as Library of Congress benefactors. In particular, Gertrude Clarke Whittall's donation of five Stradivari instruments and the funding for concerts at which they could be played helped establish the library as a patron of the arts. This new private funding through the Trust Fund allowed the Library to establish chairs and consultantships for scholars and a consultantship for poetry, which by 1986 had evolved into the Poet Laureate Consultant in Poetry.

Putnam was careful in defining the use of the support the library received through the Trust Fund. Private funds were to serve a limited role and were intended to supplement, not replace, the annual government appropriation. His vision for the Library's cultural and educational role and its development established the precedent for the valuable private sector support that the Library of Congress receives today.

Putnam embraced the library's symbolic role as a cradle of Jeffersonian democracy in 1921, when he arranged for the nation's two most precious documents—the Declaration of Independence and the Constitution—to be transferred to the library from the State Department. In 1924, the documents went on permanent public display in a specially designed “Shrine” in the library's Great Hall. The library transferred both documents to the National Archives in 1952. The Library of Congress still holds, as one of its greatest treasures, Jefferson's handwritten draft of the Declaration of Independence. In his book *The Epic of America*, published in 1931, historian James Truslow Adams paid tribute to the Library of Congress “as a symbol of what democracy can accomplish on its own behalf ... founded and built by the people, it is for the people.”^[13]

The rapid expansion of the Library's collections and services during Putnam's 40 years as Librarian naturally required increased space. Additional book stacks within the Jefferson Building were built in 1910 and 1927. Legislation to acquire land for a new structure was approved in 1928, and the Annex Building (today the Adams Building) was authorized in 1930. Construction was delayed during the Depression years, but the classically simple, rectangular structure, chiefly intended for book storage, was completed in 1938 and opened to the public in 1939.

The Library of Congress as a democratic institution and repository of American cultural traditions was a concept that captured the imagination of Putnam's successor, writer, lawyer, and poet Archibald MacLeish. Appointed by President Franklin Roosevelt in 1939, MacLeish served as Librarian of Congress until the end of 1944, when he became assistant secretary of state. An advocate of U.S. involvement in World War II, MacLeish used the office of Librarian of Congress imaginatively to speak out on behalf of democracy. He urged librarians to become “active agents” of the democratic process, and criticized his fellow intellectuals for their failure to defend American culture against the threat of totalitarianism. He became the most publicly visible Librarian of Congress in the history of the office.

Paying tribute to Jefferson's concept of liberty and self-government, in 1941 Librarian MacLeish dedicated the South Reading Room in the Adams Building to the library's principal founder. At MacLeish's request, artist Ezra Winter decorated the Jefferson Reading Room with four murals that drew their themes from quotations from Jefferson on the subjects of freedom, labor, the “living generation,” education, and democratic government. MacLeish also established a “democracy alcove” in the Main Reading Room, where readers could find “the classic texts of the American tradition,” including the Declaration of Independence, the Constitution, the Federalist Papers, and other writings of American statesmen. When in 1943, the Library commemorated the bicentennial of Jefferson's birth, MacLeish noted that “if ever a library had a single founder, Thomas Jefferson was the single founder of the Library of Congress.”^[14] An annotated catalog of the books in Jefferson's personal library by bibliographer E. Millicent Sowerby was undertaken (it was published in five volumes between 1952 and 1959), and the library started microfilming its collection of Jefferson papers in the same year.

Thanks to MacLeish's personal interests and contacts, during his librarianship the Library of Congress established new and enduring relationships with American writers and scholars. Other highlights of the fruitful MacLeish years were the development of Library-wide objectives; an administrative reorganization so thorough that it lasted for more than three decades; the creation of a rotating consultantship in poetry; and fellowship programs for young scholars. The librarian extended Jefferson's rationale to foreign materials, asserting, in his “Canons of Selection” in the 1940 *Annual Report*, that the library should acquire the “written records of those societies and peoples whose experience is of most immediate concern to the people of the United States.”^[15] Indeed, World War II's most important effect on the Library was to stimulate further development of its collections about other nations.

Postwar Expansion

Librarian MacLeish resigned in 1944 and, in 1945, President Truman named assistant librarian Luther H. Evans, a political scientist, as Librarian of Congress. Evans served until 1953. To justify his ambitious proposals in fiscal year 1947 to expand the Library's collections and services, Evans emphasized Jefferson's "doctrine of completeness and inclusiveness." The challenges of the postwar years meant, to Evans, that "no spot on the earth's surface is any longer alien to the interest of the American people." He believed that the major lesson of World War II was that "however large our collections may now be, they are pitifully and tragically small in comparison with the demands of the nation." He described the need for larger collections of foreign research materials in practical, patriotic terms, noting that in the years leading up to the war "the want of early issues of the *Voelkische Beobachter* prevented the first auguries of Naziism," whereas during the war, weather data on the Himalayas from the Library's collections helped the Air Force.^[16]

The acquisitions, cataloging, and bibliographic services of the Library grew during the Evans years, but not as rapidly as the librarian would have liked. He believed that the Library of Congress should actively serve all libraries, but an economy-minded postwar Congress balked at his expansionist plans. Evans's leadership and energy helped to compensate for the lack of large budget increases, however. His strong personal interest in issues such as copyright and intellectual freedom strengthened the Library's involvement in each of these areas.

A new Library of Congress commitment to international librarianship and cultural affairs was one of Evans's major contributions. The Library of Congress Mission in Europe, organized by Evans and director of acquisitions Verner W. Clapp in 1945, acquired European publications for the Library and for other American libraries. The library soon initiated automatic book purchase agreements with foreign dealers around the world and greatly expanded its agreements for the international exchange of official publications. It organized a reference library in San Francisco in 1945 to assist the participants in the meeting that established the United Nations. In 1947, a Library of Congress Mission to Japan provided advice for the establishment of the National Diet Library.

Evans's successor as Librarian of Congress was L. Quincy Mumford, who was director of the Cleveland Public Library in 1954, when President Eisenhower nominated him. During his 20 years in office, Mumford guided the Library through its most intensive period of national and international expansion. In the 1960s, the Library of Congress benefited from increased federal funding for education, libraries, and research. Most dramatic was the growth of the foreign acquisitions program, an expansion based on Evans's achievements a decade earlier. In 1958, the library was authorized by Congress to acquire books

by using U.S.-owned foreign currency under the terms of the Agricultural Trade Development and Assistance Act of 1954 (PL 480). The first appropriation for this purpose was made in 1961. The next year the library established acquisitions centers in New Delhi and Cairo to purchase publications and distribute them to research libraries throughout the United States. This, however, was only the first step.

In 1965, President Lyndon B. Johnson approved a Higher Education Act, which, through its Title IIC, directed the Library of Congress to acquire, insofar as possible, all current library materials of value to scholarship published throughout the world, and to provide cataloging information for these materials promptly after they had been received. This law came closer than any other legislation to making Jefferson's concept of comprehensiveness part of the Library's official mandate. The new effort was christened the National Program for Acquisitions and Cataloging (NPAC). The first NPAC office was opened in London in 1966 and expanded rapidly. By the end of the twentieth century, the library had six overseas offices, as well as cooperative acquisitions arrangements with booksellers and libraries around the world.

Shared acquisitions and cataloging made international bibliographic standards imperative. The crucial development took place in the mid-1960s: the creation of the Library of Congress Machine-Readable Cataloging (MARC) format for communicating bibliographic data in machine-readable form. This new capability for converting, maintaining, and distributing bibliographic information soon became the standard format for sharing data about books and other research materials. The potential for worldwide application was immediately recognized, and the MARC format structure became an official national standard in 1971 and an international standard in 1973.

The preservation and conservation of library collections became an important concern of research libraries in the 1960s. In 1967, the Library of Congress inaugurated a pilot project to study techniques for the preservation of deteriorating or "brittle" books—volumes disintegrating because they were printed on acidic paper. Today, the Library's Preservation Office administers what has become the world's largest library research and conservation laboratory and shares techniques with the library community.

Amid the rapid growth of collections, computer and preservation methods, there took place the most recent serious public debate about the dual legislative and national roles of the Library of Congress. The Library of Congress has played a leadership role in the American library community since 1901; however, its first responsibility, as part of the legislative branch of the American government, always has been to support the reference and research needs of the American national legislature.

The National Library Debate

In 1962, at the request of Senator Claiborne Pell of the Joint Library Committee, Douglas Bryant, associate director of the Harvard University Library, prepared a memorandum on “what the Library of Congress does and ought to do for the Government and the Nation generally.” Bryant urged further expansion of the library’s national activities and services, proposals endorsed by many professional librarians, and suggested several organizational changes. He also said it would be “desirable” to transfer the Library to the executive branch of government. Mumford replied to the Bryant memorandum in his 1962 annual report, strongly defending the Library’s position in the legislative branch and stating his opposition to the suggestion that the Library’s name might be altered to reflect its national role: “The Library of Congress is a venerable institution, with a proud history, and to change its name would do unspeakable violence to tradition.”^[17]

The debate continued in the professional library community. The fiscal retrenchments of the 1970s and Congressional reemphasis on the library’s legislative services under the provisions of the Legislative Reorganization Act of 1970 made increased national library aspirations impractical. The new law changed the name of the Legislative Reference Service to the Congressional Research Service and expanded its functions, placing increased emphasis on policy research and analysis and on direct services to both individual members of Congress and congressional committees.

Before he retired in 1974, Librarian Mumford witnessed the authorization by Congress of the construction of a third Library of Congress Building and, in 1971, the beginning of its construction. In 1975, President Gerald R. Ford nominated historian Daniel J. Boorstin, previous director of the Smithsonian Institution’s National Museum of History and Technology (now the National Museum of American History), to be the twelfth Librarian of Congress. Boorstin was confirmed by the Senate and took the oath of office on November 12, 1975, in a ceremony in the Library’s Great Hall.

Reorganization and New Technology

Boorstin immediately faced two major challenges: the need to review the Library’s organization and functions and, pending the forthcoming expansion into the James Madison Memorial Building, the lack of space for both collections and staff. In 1976, he created a Task Force on Goals, Organization, and Planning, a staff group that conducted, with help from outside advisers, a 1-year review of the Library and its role. Many of the task force’s recommendations were incorporated into a subsequent reorganization. The move into the Madison Building, which began in 1980 and was completed in 1982, relieved administrative as well as physical pressures, and enabled

Librarian Boorstin to focus on what he deemed most important: the strengthening of the Library’s ties to Congress, and the development of new relationships between the Library and scholars, authors, publishers, cultural leaders, and the business community.

The Library of Congress grew steadily during Boorstin’s administration, with its annual appropriation increasing from \$116 million in 1975 to more than \$250 million in 1987, even though budget restrictions slowed growth severely in 1985 and 1986. Similar to MacLeish, Boorstin relied heavily on his professional staff in technical areas such as cataloging, automation, and preservation of library materials. However he took a keen personal interest in collection development, copyright, in book and reading promotion, in the role of the Library of Congress in American life, both in practical terms and symbolically, and in the library as “the world’s greatest Multi-Media Encyclopedia.” Boorstin’s style and accomplishments increased the visibility of the library to a point where, in January 1987, a *New York Times* reporter, discussing Boorstin’s decision to retire as librarian, called the post of Librarian of Congress “perhaps the leading intellectual public position in the nation.”^[18]

Boorstin’s successor, historian James H. Billington, was nominated by President Reagan and took the oath of office as the thirteenth Librarian of Congress on September 14, 1987. Billington instituted his own 1-year review of the library’s functions through an internal Management and Planning (MAP) Committee, a review that also included regional forums in nine cities. The result was a major administrative reorganization based on goals identified through the MAP study. Convinced that the Library of Congress needed to share its resources more widely throughout the nation, he instituted several projects to test new technologies that might provide for direct access by libraries and schools to the library’s collections and data bases. The experimental American Memory project, for example, provided electronic copies of selected collections of American history and culture to schools and libraries. A 2-year pilot project providing online access to the library to the 50 state library agencies began in 1991.

Envisioning a new educational role for the Library, Billington began strengthening the library’s cultural programs and established its first Educational Office. Recognition of the crucial importance of private funds in building and sustaining national outreach projects led to the creation of a Development Office in 1988, and the establishment, in 1990, of the James Madison Council, a private sector support body consisting mostly of business executives and entrepreneurs. In fiscal 1991, Billington obtained a 12% budget increase for the library to help make its collections more accessible. In 1992, however, in response to a series of thefts and discoveries of vandalism, the library was forced to undertake new security measures that restricted access to the collections.

In his budget presentation to Congress for fiscal year 1993, Billington emphasized how the Library of Congress was becoming an important catalyst for the educational, competitive, and creative needs of our nation. The complexities of the information age were most apparent in the librarian's discussion of new electronic technology. This new technology should, Billington stated, be applied to a Jeffersonian purpose, enabling the library to "increase the knowledge available to Americans in their local communities—in schools, colleges, libraries, and private sector research enterprises, from Florida to Alaska." Thus, "even those Americans far from great universities and the most affluent schools and libraries can still have access to the best of the nation's heritage and the latest in up-to-date information." Technology makes this possible; the library's strategy envisions bringing an "electronic library rapidly from concept into initial operation."^[19]

In 1994, the Library made its bibliographic records and selected items from its Americana collections available electronically, and the institution began establishing what is now a multitiered presence on the World Wide Web. The same year Congress approved the Library's 5-year National Digital Library (NDL) program. Through a combination of private and government funding, the NDL program began digitizing historical materials from more than 70 American history and culture collections in the Library and collecting them from 33 other research institutions. The program made those digital collections available, free of charge, on the library's American Memory Web site.

Thus began a new era in service and accessibility to the library's collections. The library increasingly became a leader among large institutions making collections freely available via the World Wide Web. Its Web site, with sections devoted to its own collections, catalogs, and online exhibitions, as well as to legislation from Congress and information from the U.S. Copyright Office, has become one of the most frequently used in the world.

The Library of Congress at 2000

In testimony before Congress in January 2000, Billington told the legislative branch appropriations subcommittee that the Library of Congress had become a leading—if not the leading—provider of high-quality, free educational material in the revolutionary new world of the Internet.^[20] Moreover, a National Academy of Sciences report about the library's role in the electronic age, *LC21: A Digital Strategy for the Library of Congress*, commissioned by Billington in 1998 and released in July 2000, called on the library to greatly increase its resources and leadership capabilities to develop a digital strategy for the next century. The librarian accepted the report's conclusion and soon obtained additional appropriations for its implementation.

A historian of Russian culture, Librarian Billington took a special interest in using the library and its resources to encourage the development of democracy in Russia and in Central and Eastern Europe after the collapse of Communism in the early 1990s. Congressionally approved projects included a parliamentary assistance program for Central and Eastern Europe (1990–1996) and, beginning in 1999, the Russian Leadership Program to bring young Russian civic, political, and professional leaders to the United States to observe American democracy and business firsthand.

The Library of Congress commemorated its Bicentennial throughout 2000. The Bicentennial Steering Committee chose "Libraries-Creativity-Liberty" as the major theme because it encompassed the library's ambition to promote creativity in the preservation, organization, and sharing of recorded knowledge as well as the key role all libraries play in connecting knowledge and information to citizenship in a democracy.

Major bicentennial projects looked to the library's future. They included: 1) "Gifts to the Nation," a high-visibility, privately supported initiative to acquire for the library's collections significant items identified by its curators and specialists. Thanks in large measure to support from the library's James Madison Council, "Gifts to the Nation" resulted in 384 separate gifts totaling \$109.8 million; 2) the launching, with a \$1 million gift from Madison Council members, of a project to reconstruct Thomas Jefferson's personal library; 3) the honoring, as Library of Congress "Living Legends," of 84 individuals selected for their significant creative contributions to American life; 4) "Local Legacies," a grassroots initiative developed through congressional offices and local organizations that documented America's cultural heritage at the turn of the millennium; and 5) on April 24, 2000 (the library's 200th birthday), the launching of "America's Library," a new Web site for children and families. As 2000 came to a close, Librarian Billington made two additional announcements: the library had achieved its bicentennial goal of mounting 5 million digital items on its American Memory Web site, and the Madison Council chairman John W. Kluge's gift to the bicentennial was an unprecedented gift of \$60 million to establish a Kluge Center for Scholars and a Kluge Prize in the Human Sciences.

PERSPECTIVES ON THE LIBRARY'S DEVELOPMENT, 1800–2000

The Library's Legislative and National Roles

The library's initial organization act of 1802 gave the president the authority to appoint the Librarian of Congress—even though the library was a legislative branch agency. The Congress did not vote itself the power to confirm the president's choice as Librarian of Congress

until 1897, on the verge of the move into the library's first building. There is no fixed term for a Librarian of Congress, but when the Senate gained the power to confirm the president's choice in 1897, a "balance" was struck; since then—when the office of librarian also gained the considerable power and independence it holds today—in effect the job has become a lifetime appointment.

The legislative and national functions of the Library of Congress are truly "dual" only in the sense that direct services to Congress receive priority. In all other respects, the legislative and national functions are each inherent parts of the Library's fabric. In 1962, in his response to the Bryant memorandum, Librarian of Congress L. Quincy Mumford (1954–1974) observed, accurately, that Congress had "recognized the national responsibilities of the Library in a way that matters most—with understanding and consistent support."^[21] Historically the pattern has been for the library to grow in stages, often with legislative and national functions alternating in emphasis. Naturally there also have been periods of retrenchment, but on the whole the expansion of the institution has been remarkably steady.

The Library of Congress and American Librarianship

The Library of Congress did not provide direct services to the library community until after its first building opened in 1897 and until the administration of Librarian of Congress Herbert Putnam (1899–1939). Under Putnam's leadership, however, libraries and librarians became a major Library of Congress constituency—second in importance only to Congress itself.

Through the years, the relationship between the library and the American library community—while close—has not been necessarily close-knit and at times both rocky and controversial. In the digital age, the relationship has changed radically since librarians across the country no longer need to rely on centralized technical services from the Library of Congress—as they did from the first decade of the twentieth century until near the end of the century. From the 1980s onwards, other libraries increasingly drew on other massive databases for bibliographic information and began to access collections directly on the World Wide Web; the Library of Congress remained an enormously important supplier of bibliographic data, but it was much less the acknowledged leader of the American library community than it was in the first half of the century.

The International Role of the Library of Congress

World War II not only stimulated the growth of the library's international collections, but also a new international role for the institution, one first fully envisioned by Luther H. Evans, Librarian of Congress, 1945–1953. As

the twentieth century came to a close, it was clear that the Library's international activities were increasing, not only for the benefit of libraries but also for Congress, the nation, and institutions around the world. New electronic resources began to make it easier to share the institution's unparalleled international collections. Moreover, a world role for the Library of Congress was advocated by the two scholarly public servants who served as Librarian of Congress during the last 25 years of the century: historians Daniel J. Boorstin (1975–1987) and James H. Billington (1987–).

For Boorstin, the evolution of the Library's international role was natural:

Our country has been peopled with immigrants from all over the world. How could we pretend to make a truly national library for our United States unless we collected in the languages that millions spoke when they arrived—and still arrive on our shores? In the United States, of all the nations on earth, our *national* library (like our people) must be *international*.^[22]

Billington, in a booklet published to accompany a new exhibit, *World Treasures of the Library of Congress*, echoed the theme:

We at the Library of Congress are as proud of our international collections as we are of our American collections . . . The Library of Congress is the largest and most inclusive library in the world, and it is truly an international institution.^[23]

The Library's Educational Role

In the mid-1990s, Librarian of Congress Billington began advocating a new educational role for the library, one that would take full advantage of the institution's new presence on the World Wide Web and the success of the Library's National Digital Library program—which Congress endorsed and supported.

At the beginning of a new century, when the interdependence and complementarity of all types of educational and cultural institutions is increasingly recognized, Billington's efforts to exploit new electronic technologies and educational partnerships, governmental and private, indeed pointed to a greatly enhanced educational role for the Library of Congress in the century ahead.

Librarian Billington's determination to extend the reach and influence of the Library of Congress is very much in the ambitious tradition of his predecessors. Alone among the world's great libraries, the Library of Congress still attempts to be a universal library, collecting materials of research value in almost all languages and media. It continues to be guided by Thomas Jefferson's belief that

democracy depends on knowledge and that all topics are important to the library of the American national legislature and therefore to the American people and indeed to all people.

Library Portals and Gateways

Frank Cervone

Purdue University Calumet, Hammond, Indiana, U.S.A.

Abstract

Libraries have had web presences since the introduction of the World Wide Web. Providing access to information provided by the library has been attempted through various means throughout the years but no method has been as popular or pervasive as the uses of library gateways and portals. Development of gateways and portals in libraries has been affected by many factors many of which have been outside the direct control of libraries or librarians. Both the history of library practice in this area and these external factors have had a substantial impact on the state of library portal and gateway development today.

INTRODUCTION

In standard English, the literal meaning of “gateway” is a passage that is or may be closed by a gate.^[1] In architecture, a portal refers to a door or gateway usually of stately or elaborate construction. In the early- and mid-twentieth century, an obsolete meaning of portal^[2] was rejuvenated by science fiction writers to describe the concept of transference from one place to another via technological, and sometimes mysterious, means. From the complex intersection of these various definitions, the use of both gateway and portal within the information professions has developed to signify some type of single point of entry to a world of information resources.

Ever since the introduction of library Web sites in the early 1990s, the understanding of what a gateway is has remained fairly constant. In contrast, what constitutes a portal has progressively evolved in the relatively short period of time that libraries have been providing services via the Internet. In the early days of the World Wide Web (1994–1998), portal and gateway were used interchangeably. Both were used to refer to any Web site that provided some type of organized access to resources on the web.

As technology has developed, the use of these terms has diverged and both terms have become more specific. Current usage of gateway refines the original meaning to specifically refer to a Web site that attempts to present an end user with a comprehensive and related set of resources associated with a distinct subject area. This is in contrast to a portal which is a Web site that presents an end user with a comprehensive and related set of resources associated with the specific interests of the individual. Further complicating matters, portal also has a specific, technological meaning derived from its use in computer science. Portal in technological contexts normally refers to the specific technologies used to implement the services which provide customized information to an end user. When used in this sense, the emphasis is on the underlying

software that implements the retrieval of information for display rather than the specifics of the information content presented to the end user.

One of the drivers behind library adoption of portal technology has been the desire to build communication mechanisms that mirror the collaborative and interactive use of traditional libraries^[3] in the context of Web-based delivery of services. To accomplish this, a portal must provide components that lead a user to a set of information which is customizable to the individual interests of the user while being sensitive to the role of the user within the organization.^[4]

Library portals are able to accomplish this through several features and functions. These include:

1. Single user authentication and authorization to resources within the portal.
2. Providing access multiple sources of information.
3. Facilitating a basic level of automated personalization based on the characteristics of the user.
4. Personalizing the selection of resources displays as well as the look-and-feel of the interface.
5. Incorporating a consistent access interface to the diverse information resources available via the portal.^[5]

TYPES OF PORTALS

Conceptually, gateways all tend to be similar. The major differentiating factor is their focus. Most gateways in academic libraries are focused on subject or discipline, but gateways in libraries can also be designed for specific user communities (undergrads, engineering students, tweens, seniors, etc.) or by an area of interest such as mystery book club members, community action counsel members, etc.

Portals are much more difficult to classify mainly because portals can be used in a wide variety of contexts and types of organizations. Therefore, different types of portals technologies have developed and each tends to fulfill the information needs of the end users in a different way. Even so, a common thread found in all portal definitions is an understanding that the main goal of a portal is to gather, share, and disseminate information from disparate sources through an easy-to-use, integrated interface.

Sites that serve as a generalized entry point to the Internet for the public, such as Yahoo!®, MSN, and Lycos are often referred to as “horizontal portals” given the broad array of resources and services they provide.^[6] While portals of this type may provide individual options for customization, their primary function is to offer generalized services from diverse sources in a single, consistent interface. In addition to search services, this type of portal usually provides an integrated set of standard services such as news feeds, stock market information, entertainment, as well as value-added services such as an e-mail account, chat, instant messaging, and personal calendaring. By combining unique information sources and distinctive sets of services, portals of this type hope to become “sticky” to their users. That is, these sites hope to have significant inherent appeal that promotes a desire in people to repeatedly return to the site. Because of this goal, horizontal portals are usually designed to be “destination sites” that deliberately attempt to keep users within the confines of the portal, interacting with its content, rather than providing “gateway services” that lead to content on other sites.

While most library portals are “public portals” their primary function is to connect people with information regardless of where that information may actually be located. Consequently, library portals often have more in common with “vertical portals,” also known as “vortals,”^[7] than with horizontal portals. Vortals differ from horizontal portals in that they provide focused content and gateway services for specific, and oftentimes niche, audiences. Given that the content and services of a library portal are typically aimed at a specific community, such as the population of a local governmental jurisdiction, a particular institution, or organization, library portals tend to model the design patterns associated with vortals more so than the models associated with horizontal portals.

Nevertheless regardless of orientation, all of the portal types identified so far can be classified as “information” or “content portals.”^[8] Portals of this nature have been called “first-generation portals”^[9] in an effort to distinguish them from more sophisticated systems such as “knowledge portals” which support the full range of tasks a knowledge worker performs on a day-to-day basis. Many libraries and information agencies have internal portals in the form of a “corporate” or “enterprise portal.” These portals are not

available to the general public as they provide staff within the organization with operational information and assistance to perform their jobs more effectively.

Traditionally, corporate portals tended to focus on either collaboration support or knowledge work support and were classified as either a “collaboration portal” or “decision processing portal”^[10] depending on their primary purpose, but this distinction is fading rapidly. Collaboration portals, not surprisingly, focus on providing groupware tools such as e-mail, threaded discussions, and instant messaging functions as well as access to traditional work products such as reports, meeting minutes, and memos. Decision processing portals focus on providing access and tools that allow for better decision making based on organizational information. In a library, a typical application in a decision processing portal would be data mining tools that could be used against a wide variety of data collected in the library. For example, data mining could be used to discover patterns within circulation data that could be used to inform collection development practices.

A further factor differentiating corporate portals from traditional library portals is that corporate portals often provide life cycle management of corporate records (similar to a repository), auditing tools to provide insight into how the portal is being used, expert directories which are generated based on inferred or explicit declarations of expertise, and other tools to locate knowledge and experts within an organization.^[11]

Within this overall environment of portals, the gateways and portals libraries have provided for public use are generally differentiated into three general types:

1. Customizable e-resource portals, primarily focused on providing access to external resources such as commercial databases and full-text products.
2. Integrated web service portals, which also include features such as content alerting services and some collaboration tools, such as reference chat.
3. Metasearch systems that contain portal features.^[12]

This differentiation of portal types is reflective of both the development of portal technology as well as the evolution of information gateways within libraries.

Most library portals before 2004 were of the first type, customizable e-resource portals. Although some libraries, such as Cornell University, provided nascent integrated web service portals, the web services were often narrowly focused. For example, the Cornell University’s My Library system provided a convenient dashboard of limited services such as a new book request and a content awareness notification for new books in the catalog.^[13]

Since 2004, much of the development of portals in libraries has been focused on building integrated resource discovery systems based on metasearching.

TECHNOLOGY AND STANDARDS USED IN LIBRARY PORTALS

Several technological standards are used within library portals to deliver content and services. Some of these protocols are specific to portals (such as JSR—Java Specification Request—168 and Web Services for Remote Portlets [WSRP]) while others are used in a more broad technological arena. The most essential of these standards for portals include:

- **Java Specification Request (JSR) 168**—The Java Portlet Specification (JPS) defines a programming model for developing “portlets,” the user selectable interface components that are used within a portal for accessing content or services, in the Java programming language. The JPS V1.0 (JSR 168) provides for a basic programming model that includes such things as:
 - *Package formats* for defining methods for combining portlets into a single application that is installed on the portal server.
 - *Portlet data models* which provide mechanisms to the portlet for storing information related to content rendering, session status information, and persistent data.
 - *Portlet modes* which provide a vehicle for a portal to communicate with the portlet and tell it what tasks should be performed to generate content.
 - *Window states* that define the amount of space on a web page that will be permitted for the content generated by the portlet.

Work on providing additional functionality, such as the ability to transform the content of portlet requests and responses on the fly, is ongoing in the development of the successor protocol, JSR 268.^[14]

- **LDAP**—the Lightweight Directory Access Protocol is a protocol for accessing information in directory servers. Most often, these directory servers are used to provide authorization and authentication information for the portal. Information in LDAP is stored hierarchically, in a tree structure, with finer levels of granularity being achieved as one traverses down the tree.^[15]
- **NCIP**—the Circulation Interchange Protocol (Z39.83) defines the transactions required to support circulation activities among library systems. Some of the services supported by the protocol include patron and item inquiry as well as the ability to check-in, check-out, renew, hold, and reserve materials.^[16]
- **OAI-PMH**—the Open Archives Initiative Protocol for Metadata Harvesting is a mechanism for the widespread exchange of metadata between a content provider and a portal. Based on a client/server model, “data providers” are systems that expose the metadata

related to their content whereas “service providers (SPs)” (also known as “harvesters”) make requests of the data providers to retrieve (harvest) the metadata related to their collections.^[17]

- **OpenURL**—the OpenURL standard is a syntax for creating metadata and/or identifiers about an information object. OpenURLs are used in place of static URLs to provide the opportunity for the requesting service to provide additional metadata or contextual information at the time of the information request in order to locate the most appropriate resource, given the users’ current environmental context. The primary use of this technology in libraries is to direct users to appropriate, accessible copies of materials, given their current patron status and location within the organization (i.e., student, faculty, remote borrower, etc.).^[18]
- **RSS**—defined variously as “RDF Site Summary,” “Really Simple Syndication,” and “Rich Site Syndication” is an XML-based data format used to publish information about a provider’s content. Primarily used to indicate the availability of new content from an information resource, a “feed” or “channel” typically contains either the full text of a data item or content summary information with a link to the full text.^[19]
- **Shibboleth**—is an architecture for federated identity-based authentication and authorization. It provides a mechanism for the secure exchange of information about credentials for users within a group of systems linked together in a common federation. With Shibboleth, single point authentication and authorization can be provided for all users for all services within the federation without each SP having to maintain local user identification and password information for each member of the federation. Based on a client/server model, identity providers (IdPs) in a Shibboleth federation supply user information to SPs who are responsible for interpreting the credentials returned. The SPs use this information to provide access to content as appropriate for the credentials that have been presented.^[20]
- **SRW/U**—The Search/Retrieve via the Web or URL Service protocol builds upon the Z39.50 framework by providing a streamlined, web-based mechanism for searching databases via a standard search and retrieve service. Based on the CQL query language, SRW provides both Simple Object Access Protocol (SOAP) and URL-based request mechanisms through three operations,
 - *Explain*—provides the mechanism for an SRW/U client to retrieve a description of the features and facilities available on an SRU/W server.
 - *Search/retrieve*—allows the client to submit a search request and retrieve the results from the server that match the request.
 - *Scan*—provides the ability of a client to browse an index of terms on a server.

SRU and SRW differ only in the way they are implemented. In SRU, the request to the server is transmitted via a URL using HTTP as the transport mechanism, an architecture known as representational state transfer (REST). The results returned are XML-based, but it is assumed they will be used for display purposes. SRW on the other hand is SOAP-based and both the initial query and the result set are returned as XML data streams. Any available transport mechanism can be used for the request and response. Furthermore, no assumptions are made about the use of the returned result set.^[21]

- WSRP—is a protocol designed for interacting with presentation-oriented web services on remote portlets. JSR 168 and WSRP are complementary technologies. In a typical environment, JSR 168 is used to define a portlet application and WSRP is used to define the actual operations of the portlet. This division of labor promotes application portability and therefore is common in environments where Java is not the only language used for building portlets. With operations defined via WSRP, portlet functionality can be harmonized across a diverse application development environment including, e.g., Microsoft's .NET framework.^[22]
- Z39.50—was introduced in 1988 as the first network-based transfer protocol for bibliographic information. Based on a client/server model, Z39.50 provides a rich set of operations (such as search, retrieve, sort, and browse) as well as extensive database schemas that cover a wide variety of bibliographic and other data. This extensive functionality allows for great flexibility in searching and retrieving results from remote databases, but it is also one of the major impediments to Z39.50 implementation. Because of the complexity of functionality within Z39.50, vendors offer varying levels of support for the full Z39.50 protocol and no vendor completely supports the entire specification. Nonetheless, use of the Z39.50 protocol is ubiquitous in library automation; however, it is slowly being replaced by newer technologies that are easier to implement, such as SRU/W.

HISTORY OF PORTALS AND GATEWAYS IN LIBRARIES

The conceptual basis of portal functionality can be traced back to the decision support systems (DSS) of the 1970s, which provided support for decision making by staff in specific situations where expert advice was required. In the 1980s, these DSS systems were expanded and enhanced to create executive support systems (ESS) which contained many of the functions now found in portals.^[23] By the early 1990s, systems were being considered and prototyped in libraries that would extend ESS-like functionality to

scholarly work. As noted at the time, a “scholar’s workstation” would benefit the end user substantially as “errors in transcription of bibliographic citations could be reduced, reference works consulted directly from the workstation, and literature searches conducted and recorded without a trip to the library in some cases” (p. 269).^[24]

In 1994, David Filo and Jerry Yang brought Yahoo! online and made it available to a worldwide audience via the Internet.^[25] Originally designed as a way to keep track of their personal interests on the Internet, at the time of its introduction it was the first major site to introduce the concept of a gateway by using categorization (and subcategorization) for linking to Internet-based resources. As such, it provided the model for subsequent development of gateway sites.

The quick success of Yahoo! demonstrated the utility of the gateway concept. In October 1994, the Berkeley Public Library Index to the Internet, known today as the Librarians’ Internet Index (LII), made its debut on the web, having been migrated from an earlier life as a “gopher” bookmark site.^[26] The LII was not originally intended to be a gateway for the general public but as a gateway for librarians who wanted to learn more about resources available on the web. As such, the LII was an important factor in focusing the attention of libraries and librarians on the potential for Internet-based services.

In 1995, an enterprising group of graduate students in the School of Information and Library Studies at the University of Michigan developed the Internet Public Library (IPL) as a mechanism for exploring issues related to libraries, librarians, and librarianship in the newly emerging environment of the Internet.^[27] In a model similar to the effect Yahoo! had on Internet gateways in general, the IPL set the course for future development of library gateways.

At the time however, few of the scholarly resources libraries have traditionally collected, such as books and journals, were available via the Internet. Most of what were referred to as “electronic resources” were still delivered on CD-ROM. Consequently, until 1997 most library Web sites functioned more as informational sites describing the resources and services available in the library and less as gateways to scholarly resources.

In 1997, things changed significantly for two reasons. Yahoo! once again introduced a service that had an important effect on expectations about information dissemination. With the introduction of My Yahoo!, many Internet users were introduced to the idea that content could be customized to their particular areas of interest. With the number of Internet users rapidly expanding, customized portals were seen as an ideal technological solution to the problem of meeting the diverse needs of a broad audience. Concurrently, traditional print publishers began to see the great economic potential of providing vast quantities of electronic content, mainly derived from legacy printed materials, to libraries.

By the end of 1998, with the explosion in the number of Internet sites and the greatly expanded inventory of scholarly databases and full-text resources online, it became increasingly evident that the use of gateways as the sole mechanism for providing guidance to appropriate information resources was being stretched to its limits. As noted in the January 1999 report of the Cornell University Library gateway focus group,

the Gateway presents networked resources and services but it does nothing to simplify the complexity of today's information scene. . . users appreciate the richness that the gateway offers for all subjects, but they yearn to have a more personal space. If they cannot 'rearrange the furniture' in the entire system, at least they would like a little corner to themselves where they can dictate how important certain resources are based on their own needs.^[28]

Portal technology specifically designed for libraries became available in late 1998 when developers at North Carolina State University (NCSU) released the first version of the "MyLibrary" software. The debut of a portal for library-specific use came at an opportune time. Within a short period of time, libraries at California State Polytechnic at San Luis Obispo, Charlotte Public Library, Cornell University, Los Alamos National Laboratory, Mississippi State University, University of Toronto, University of Utah, University of Washington, and Virginia Commonwealth University (VCU) had all introduced some level of customizable services for their library patrons under the rubric of a "My Library" service, some using the software developed at NCSU, but many developing their own.

However, after this initial flurry of activity, development of library portals floundered^[29] due to three different factors. The first was that many libraries hesitated about adopting portal technology due to early reports of less than overwhelming success in capturing the attention of library patrons with portals. In detailing the status of the first-year review of VCU's My Library implementation, the authors of the report noted that only 12% of the active accounts in the system had logged in more than 21 times in the prior 6 months.^[30] At the third-year review, VCU reported just slightly 4% of the potential user population was actively using the My Library portal functions.^[31] A comparably low level of portal adoption was also reported at NCSU^[32],^[33] and University of Washington.^[34] Two of the recurring themes in these reports related to the difficulty people had with customizing the portal to their information needs and the difficulties subject-based categorization created for undergraduates who needed to search across a broad range of material. In 2006, researchers at the University of Illinois at Chicago noted that the difficulty in using discipline-specific portals had not gone away or been alleviated in a substantive manner.^[35]

The second factor inhibiting the adoption of portals was linked to work that was being done to position the library catalog as a portal to the Internet. Much of the impetus for this movement can be traced to the "Bicentennial Conference for Bibliographic Control in the New Millennium," where there was a great interest expressed by some segments of the library community in reinvigorating and repurposing the library catalog as a portal to the Internet. Thomas^[36] discussed the pros and cons of this approach at the conference, noting that a major issue in transforming the catalog to function as a portal is that while portals are deficient at providing the depth of information a library catalog does, a library catalog does not provide the immediate and extensive coverage a portal does. In effect, the two technologies work to achieve different end results.

The third, and perhaps most influential, factor that inhibited adoption of local portal technology was associated with activities by the Association of Research Libraries (ARL) on what would become known as the "Scholars Portal." In September 1999, ARL and Online Computer Library Center (OCLC) hosted a meeting on strategic issues in academic libraries. From this meeting arose a consensus that libraries were in danger and ran a very real risk of being circumvented by commercial information services. An issue highlighted by the group was that because libraries tend to focus on local solutions, their Web sites do not provide an effective entry point for accessing the broad array of web resources available.^[37] Jerry Campbell, then Dean of Libraries at the University of Southern California, was one of the early proponents for the development of a collaborative research library web presence.

To put this idea into practice, a working group (the ARL Scholars Portal working Group) was established in late 2000 with two guiding principles directing the work of the group:

- "First, that access to disparate electronic resources and services can be improved through integration, both within a single institution and across multiple institutions,
- Second, that efforts to effect such integration should leverage work already being carried out in ARL libraries."^[38]

To begin the process however, the group had to focus on an initial goal. After discussions, the decision was made to develop a "super discovery tool" that would incorporate results from licensed, commercial content, as well as open access material, drawn from a broad range of subject areas and institutions. In spring 2001, the working group conducted an environmental scan to see if the technology was available to develop the super discovery tool, and after reviewing over 30 products, they determined that it would be possible to implement the initial concept. In

early 2002, the project made a significant move forward when a core group of libraries (University of Southern California; University of California, San Diego; Dartmouth College; University of Arizona; Arizona State University; Iowa State University; and University of Utah) signed on to the Scholars Portal Project (SPP) and began working with the selected vendor (Fretwell-Downing) to implement the project.

While the final results of the ARL Scholars Portal Project did not meet the initial goals, the importance of the project in terms of library portals was the momentum it gave to the newly emerging concept of “federated search” and the routine integration of services in the web presences of libraries. An example is the formation of the ARL Metalib Portal Implementation Group (ARMPIG) in 2003. This group of ARL libraries (including Boston College; Florida Center for Library Automation; Harvard University; Massachusetts Institute of Technology; Northwestern University; University of Iowa; University of Maryland; University of California, Berkeley; University of California, Davis; and Washington State University among others) had partnered with another vendor (Ex Libris) to implement goals similar to the SPP, but with different software. This diversity of approaches within the ARL community provided a catalyst for much of the creative thinking that emerged on how to further develop library portals using federated search technology as its base.

Additionally, the Library of Congress stepped into the picture through the formation of the Library of Congress Portals Applications Issues Group (LCPAIG). Released in late 2003, the report on portal application functionalities for the Library of Congress^[39] was a significant signal to the library community that the concept of a portal based on federated search technology was a reality and something all libraries needed to seriously consider.

In approximately the same time frame, researchers at the Joint Information Systems Committee (JISC) in the United Kingdom were investigating methods for making discipline-based information more accessible in their Subject Portals Project (SPP). The goal of the SPP was to enhance resource discovery by developing a series of collaboratively developed, subject-specific portals focused specifically on the requirements of end users located within the higher education community.^[40] By late 2001, the first phase of the project had provided a prototype for combining Z39.50 federated searching with traditional selection processes in three disciplinary areas: social sciences; science, engineering, and technology; and health and life sciences. In early 2004, the second phase of the project came to a close with the launch of the integrated research portal that also now included subject areas in the arts and humanities.^[41] Of particular note in this project is its demonstration of the feasibility of collaborative selection across a diverse group of institutions as well as the possibility of combining traditional selection processes found in gateways with federated searching.

By 2005, portals based on federated searching were an accepted, if not universally appreciated, fact of life. Many in the library community were of the opinion that while “the online catalog will continue to function as the principle tool for access control of the library’s physical collections, the federated searching portal will ultimately serve as the library’s principal web gateway to digital resources.”^[42]

However, not all were convinced^[43] of the viability of federated searching in the long run, noting the problems inherent in the Z39.50 protocol and many issues related to vendor cooperation or lack thereof.

This shift in focus, along with other environmental changes such as the rapid adoption of both Google and Google Scholar^[44] for resource discovery as well as the increased adoption of campus-wide portals^[45,46] has taken some attention away from library portals as ends unto themselves. Increasingly, libraries view the library web presence, whether a portal or gateway, as just one component of their strategy to meet information needs.^[47]

CURRENT ISSUES

The impacts of portals in libraries, if one uses a review of the literature as a basis, reached its peak in the period from 2001 to 2004. Since then, discussion of portals as a distinct subject has declined and there are several factors that undoubtedly have influenced this trend.

One of the most persistent problems is that the library community has never come to an agreement on a single definition of what portal means in the library context. While a common understanding, at least in principle, of gateways has existed since the late 1990s, the same has not been true for portals. For example, when asked to define a portal in 2002, five separate ARL libraries responded with divergent definitions of a portal including

- An environment that fits specific needs.
- An interactive gateway to resources and services.
- A gateway to digital resources and services providing a high level of seamless integration including a feature-rich tool kit that enables use along the entire scholarly communications spectrum.
- Services and tools that facilitate the discovery, retrieval, and management of information from various resources in an integrated fashion while taking into account personalized needs in doing research and creating knowledge.
- A multidimensional scholarly environment.^[48]

In the intervening time, no universally accepted, single definition has taken hold.

A further complicating factor is that a review of the literature makes it clear that most library portal efforts

have not achieved wide-scale adoption rates. In part, this may be due to the relative lack of resource integration, which is a defining characteristic of a portal. As Detlor and Lewis have observed, “many would argue that most library gateways are not portals at all, but rather collections of irregularly-shaped windows facing out in the same general direction” (p. 89).^[49] It has been argued that this perception has taken hold because many library portals have been implemented in such a way that they do not “shield the user from the differences of the target resources or link them together” (p. 113).^[50] Detlor and Lewis^[51] have argued that because of this, and other deficiencies, library Web sites should not be referred to as portals.

Even if these preceding issues were to be resolved, library portals have been criticized as having the potential to create service gaps among certain segments of patrons. These criticisms are somewhat paradoxical because while a lack of robust personalization and recommendation tools on library portals^[52] have been noted as significant deficiencies, Crawford^[53] has noted that features such as these can actually create problems and service gap issues for the library patron such as:

- Differential service—because many patrons will not take the time to customize their view of the library portal, they may inadvertently create an environment where they receive less than optimal service because they do not use the portal.
- Solipsism—where the patron receives a biased or otherwise unbalanced profile of the information landscape because their interests have been too narrowly focused or precisely defined.
- Irrelevance—because of low adoption rates, the library portal suffers from neglect and fails to deliver all of the information resources that it should for a particular user.

In spite of these issues and notwithstanding the low adoption rates of library portals, libraries continue to investigate new approaches to providing relevant library resources and services by taking advantage of portal-like features and services but adopting them to new service contexts and technological developments. This shift in focus is being driven by changing patterns of information resource use as well as the realization that some older approaches to information dissemination may no longer be relevant.

This last issue is demonstrated by recent research which indicates that one of the reasons that subject gateways and MyLibrary-like portals are not adopted by undergraduate students is because they do not find them useful. Undergraduate students find Web pages specifically constructed to highlight resources and services for individual courses far more useful than generic subject guides.^[54]

Societal forces have affected trends in library science. The shift “to the user as the driving force behind library services, not the Platonic ideals of information organization” (p. 22)^[55] has led some libraries to experiment with the integration of library services through portlets into external services such as Facebook and My Space.^[56] This is not a surprising development as Strauss noted back in 2002 that “libraries would best serve their users by building portal pages, channels, and cameos rather than portals themselves” (p. 36).^[57]

CONCLUSIONS

As has been the case with many other technological developments, a potential downside to further exploration of the possibilities of integrating portal technology into systems developed outside the library is whether libraries have the resources and ability to implement these new services on a wide-scale basis. It has been noted that with “the relative scarcity of professional literature on campus portals, it does not appear that library participation in campus web portals is a primary concern among academic librarians” (p. 156).^[58] Yet there is not any conclusive research that explains why this is, so it is not clear if the issue is true lack of interest or some other reason that has not been articulated.

In either case, the long-term viability of extensive local development of portlets and other types of applications of this nature is debatable. Except for projects like the SPP at JISC and the LII, collaboration on portal development has not occurred on a wide-spread basis throughout the information professions. As Campbell has noted, “letting a thousand flowers bloom, it turns out, has always been easier than cultivating a garden” (p. 16).^[37] He warned that failure to create collective web presences and services for research could well mean that research libraries would essentially become invisible in the glut of Internet sources. Some would say that this has already occurred with the ubiquitous use of Google and Google Scholar as mechanisms for locating scholarly and reference-level information.

But as Jascó has noted,^[59] Google Scholar does not provide a comprehensive level of resource discovery, so there is still a place for developing portal and gateway functionality to meet many information-seeking needs. Because it is evident that the single box search strategy used by Google is popular with scholars, students, and librarians in addition to the general public, development of library-specific portals (as opposed to portlets for use in other applications) will increasingly focus on making finding items simpler by leveraging Web 2.0 technologies and features to provide patrons with functionality to tag items, retrieve items through tag clouds, discover items for additional and further reading, automatically correct spelling mistakes in search terms, suggest alternative search terms, and use more sophisticated mechanisms for serendipitous discovery such as dynamic facet-based browsing.

Library Publishing Initiatives: North America

Katherine Skinner

Sarah Lippincott

Educopia Institute, Atlanta, Georgia, U.S.A.

Abstract

Library publishing refers to the set of services provided by libraries to support the creation, dissemination, and preservation of original content such as eJournals, monographs, scholarly websites, and gray literature. It encompasses a rapidly evolving range of initiatives taking place in academic, research, and public libraries.

INTRODUCTION

“Library publishing” is a rapidly evolving subfield of publishing, concentrated largely in the academic and research sector. It has arisen and matured in response to demands for publishing platforms and service infrastructures to support the production and dissemination of scholarship in myriad forms, including websites and eJournals, conference proceedings and technical reports, databases and mapping interfaces, gray literature and electronic theses and dissertations. It has also emerged in the middle of a volatile marketplace where the concept of “information-as-commodity” is at war with the concept of “information-as-public-good”. As such, it has entered contested terrain, as exemplified by the high level of attention it is receiving in the publishing realm today.

The stakes in the broader field of academic publishing are high, and debates concerning the viability and appropriateness of different models—commercial, non-profit, academic, collaborative—are unresolved. This entry will begin by briefly defining library publishing. It will then situate this emerging publishing subfield in its historical context, documenting the broader spectrum of academic publishing practices that have helped to inspire and shape its development to date. Building from this framework, it will describe the current range of library publishing programs and activities in North America, including the methodologies that characterize this domain and the debates and “hot topics” that surround this set of activities.

DEFINING “LIBRARY PUBLISHING” IN AND BEYOND THE ACADEMY

“Library Publishing” is a term increasingly applied to the activities libraries undertake as they work with authors to prepare, disseminate, and preserve content. Library publishing is largely digital in nature (though some libraries provide print-on-demand services for some works). The term is usually used to denote a library’s attention to

production processes (e.g., editing, copyediting, layout/design, certification/review, rights management, branding, distribution).

In 2013, as one of its initial projects, the Library Publishing Coalition collectively formalized a definition of “library publishing” in the academic sphere as follows:

The LPC defines library publishing as the set of activities led by college and university libraries to support the creation, dissemination, and curation of scholarly, creative, and/or educational works.

Generally, library publishing requires a production process, presents original work not previously made available, and applies a level of certification to the content published, whether through peer review or extension of the institutional brand.

Based on core library values and building on the traditional skills of librarians, it is distinguished from other publishing fields by a preference for Open Access dissemination and a willingness to embrace informal and experimental forms of scholarly communication and to challenge the status quo.^[1]

Academic and public libraries, as well as a handful of historical societies and archives, report their interest and growing work in this area. Academic libraries have focused primarily on scholarly research products; public libraries generally work with local authors in their communities. Most research and documentation to date has focused on the work of academic libraries; where possible, we will provide information about the role public libraries are beginning to create in this emerging field as well.

Libraries focus on an identifiable core set of publications, as follows.

Electronic Journals

Most library publishing programs anecdotally cite eJournals among their first publishing service offerings.

Academic libraries work with individuals, departments, and organizations on and beyond their campuses to produce eJournals. Usually these eJournals arise when a faculty member (or graduate/undergraduate students in collaboration with a faculty member) approaches the library for help in launching a new journal or to transition a print journal to digital form. The scholar typically provides the topical focus, editorial board, and handles solicitation, peer review, and copy editing of articles. The library partner often provides the technical infrastructure and production know-how: hosting the journal using (or building) platforms such as the Public Knowledge Project's (PKP) Open Journal Software (OJS) and bepress' Digital Commons; providing layout/design advice; managing the copyright process (often using Creative Commons licenses); and disseminating the journal (most often through some form of Open Access publication). eJournals have matured in a range of forms and formats, including text-based journals (e.g., the hundreds of journals published using OJS); journals emphasizing the use of the digital medium to transform scholarship (e.g., *Southern Spaces*); and journals that provide scientists with mechanisms for publishing their datasets and databases along with the research findings drawn from them (e.g., *Elementa*).^[2-4]

Monographs

Libraries publish scholarly, literary, and educational monographs in digital and print (typically print on demand) versions. The disciplinary interests of the university, the library, and/or the publishing program's advisory board frequently drive the editorial program for monographs. Some focus on specific disciplines, or geographical areas. Others concentrate on publications created by faculty at their institutions. A range of publishing models has emerged in this area, from lightweight systems that eschew some traditional scholarly monograph publishing process like peer review (e.g., The University of Nebraska-Lincoln's Zea E-Books imprint) to more traditional programs, often in collaboration with a university press (e.g., the *Signale* series, a joint endeavor of Cornell University Press and Cornell University Library).^[5,6] Public libraries have also become involved in monograph publishing, typically focusing on the creative output of their local communities (e.g., the Provincetown Public Library, which plans to publish novels, short fiction, poetry, and other works through its Provincetown Public Press).^[7]

Scholarly Websites

Another core set of library publishing examples has derived from faculty/library partnerships on scholarly websites. These have often been grant-funded endeavors, and they include a wide range of publication types,

including archives of primary research materials with topical focus (e.g., Valley of the Shadow, D-Scribe); database-driven websites, often with GIS/mapping components (e.g., SlaveVoyages.org); and collections of websites (e.g., Human Rights Web Archive).^[8-11]

Electronic Theses and Dissertations (ETDs)

Libraries have been hosting and distributing ETDs through their institutional repositories for many years. ETDs represent an important component of the university's original research output. They are typically text-based documents, though they may include audiovisual elements, datasets, or other supplementary materials. Many institutions require deposit of ETDs, a subject that has received attention and criticism from some who claim that offering open access to students' research may make it difficult for them to secure book contracts with academic publishers.^[12]

Gray Literature

Preprints, technical reports, teaching materials, and other unpublished or informally published works are often referred to as gray literature.^[13] While gray literature often documents important and timely information, it typically falls outside the scope of traditional publishing channels. Libraries support its collection and distribution through institutional or disciplinary repositories. The eprint repository arXiv is an early and significant example of a library rising to the challenge of providing access to a large corpus of gray literature for a set of disciplines.^[14]

Conference Proceedings

As part of their efforts to preserve and disseminate the research output of their campuses, some libraries offer conference publishing services. The level of service varies based on the needs and capabilities of the library, but may include hosting presentation recordings, preparing formal publications, and even facilitating the process of submission and review of papers. Some libraries use a full-service software such as Open Conference Systems (OCS), which manages everything from creating a conference website, to coordinating registration, to soliciting and reviewing papers.^[15]

Data

New data management mandates, and the increasing recognition of data as a valuable scholarly product, have led many libraries to consider or implement data hosting as part of their institutional repository or as a standalone service. The Purdue University Research Repository (PURR), for example, provides metadata, DOI assignment, and storage for data such as "spreadsheets,

instrument or sensor readings, software source code, surveys, interview transcripts, or images and audiovisual files.”^[16]

Textbooks

As part of a broader push to encourage adoption of Open Educational Resources (OERs) and ease financial burdens on students, some libraries support the publication of original textbooks developed by their faculty. The SUNY Open Textbook Initiative, for example, plans to publish fifteen open textbooks in a range of disciplines.^[17]

Appendices and Supplemental Content

Libraries partner with content creators and publishers (such as university presses) to host supplemental content, often consisting of digitized archival material, audio and video files, and other media. Examples, cited by Raym Crow in his 2009 study of university press and library collaborations include the University of Nebraska’s *Journals of the Lewis and Clark Expedition Online* and Pennsylvania State University’s *Times of Sorrow and Hope*.^[18]

Digitized Out-of-Print Books and Print on Demand of Out-of-Print Materials

In addition to publishing original monographs, libraries also provide print on demand or digitization services for out-of-print books. For example, the library at the University of North Carolina at Chapel Hill offers print on demand for books originally published by the UNC Press through the “DocSouth Books” project.^[19]

HISTORY OF PUBLISHING IN ACADEMIC LIBRARIES

Over the last few decades, faculty and students across a variety of disciplines have explored the use of digital technologies to create and disseminate their research. From campus to campus, the details differ but the trend has been consistent—in many cases, these researchers have found strong support for their efforts by partnering with their campus libraries.

University and college libraries have provided the technical infrastructure and staffing necessary to facilitate many early experiments in digital scholarship, from hosting eJournals to collaborating with researchers to create digital archives, handcraft “one-off” Web creations, and produce frameworks for database- and GIS-oriented websites. In the process, libraries have also engaged in activities that mark an extension of the traditional library roles, including managing peer review processes, editing, providing design/layout services, and facilitating

discovery through search engine optimization. Some of this work has been funded through grants (campus, government, and foundation-based), but much of it has been offered as an extension of the Library’s traditional mission of collecting, disseminating, and preserving content.

Very few talked about the earliest of these experiments and forays as “publishing”; more often, these projects were discussed under the term “scholarly communications.” This nomenclature began to change around 2008, not least due to the publication of two key reports, one by Ithaka S&R and another by the Association of Research Libraries (ARL).^[13,20] The Ithaka S&R report, *University Publishing In A Digital Age*, drew clear conclusions regarding the need for presses and libraries to collaborate in order to propel the scholarly communication field forward. And the ARL report, *Research Library Publishing Services: New Options for University Publishing*, provided the first in-depth analysis of publishing services offered by academic libraries and perhaps the first “official” definition of library-based publishing as “the organized production and dissemination of scholarly works in any format as a service provided by the library.”^[20]

Other studies reinforced both this definition and the importance of these emerging library-based publishing endeavors. In particular, the seminal, IMLS-funded “Library Publishing Services: Strategies for Success” project and report demonstrated the active development and implementation of publishing services in a range of academic libraries, from small liberal arts colleges to premier research institutions.^[21] Among the key findings, more than half (55%) of those surveyed either already had or were developing library publishing services. Of these, almost all (90%) cited their desire to “contribute to change in the scholarly publishing system” as an impetus for their work in this area.^[21] The study also showed that most programs were operating in relative isolation from one another, and it documented the need for a central space where librarian-publishers could meet, work together, share information, and confront common issues. The report encouraged the development of a framework that could help library publishing services mature into a cohesive field of practice.

The “Strategies for Success” project laid a strong foundation for further action. Prompted by the results of this project, Educopia hosted a conversation in May 2012 between three library Deans who shared an interest in advancing the emerging field of library publishing: James Mullins (Purdue University), Martin Halbert (University of North Texas), and Tyler Walters (Virginia Tech). As an outcome of that conversation, in June 2012, a proposal was drafted to create a community-driven organization—the Library Publishing Coalition (LPC). Representatives from 18 major libraries and consortia vetted the vision outlined in that proposal in July 2012, and the revised proposal was released to prospective participants in August 2012. More than 50 academic libraries formally

joined the project team before the project kicked off in January 2013.

Through seed support from the Educopia Institute and participating libraries, the Library Publishing Coalition (LPC) project (2013–2014) is now engaging practitioners to design an organization to support an evolving, distributed, range of library publishing practices. The project is about studying, documenting, and evaluating how best to structure this community-led initiative to promote collaboration and knowledge sharing in the field. The project will result in an organization (launch date set for 2014) and a set of services that include an annual forum, a Directory of Library Publishing, training and education offerings, and a documentation hub.

The evolution of library publishing in universities and colleges is closely tied to the broader academic publishing environment and the seismic shifts and “crises” that have plagued it over the last thirty years.

ACADEMIC PUBLISHING AND THE “CRISES”

From roughly the late 1600s to the 1970s, there was an established order to academic publishing. Creators (the author-researchers, usually ensconced in tenure-track or tenured positions) worked with publishers (mostly University Presses and non-profit scholarly societies, who practiced “publishing” in a service-oriented manner) to produce two main forms of written scholarship: monographs and journals. Publishers served as gatekeepers, editors, and disseminators of scholarship, and they engaged networks of scholars to ensure the merit of each publication they issued. Academic libraries purchased these works, catalogued, organized, and provided access to them, and preserved them for future generations of researchers.

The unsettling of this relatively healthy system, and the resulting articulation of “crisis” can be traced back to at least the 1970s (notably, an economically volatile moment for Western markets). Conventional wisdom today cites two main culprits as the causal agents in this “crisis”: the shift from print- to digital- modes of communication and the consolidation and infamous “bundling” practices in the journal publishing market. However, this rather narrow view neglects other interwoven and critical factors that contributed to what some theorists have referred to as a “living dead” academic publishing arena.^[22] These other factors include the proliferation of publications and increase in research specialization, the popularization of ranking systems based on research output and citations, and a lack of ready public/subsidization funding to enable libraries (or enough researchers) to acquire the content.^[23] We briefly describe some of these below as part of the historical context that has prompted the emergence of library publishing and helped to inform its service orientation over the past decade.

An early factor contributing to the atmosphere of “crisis” came in the form of mimeograph technologies. In particular, the availability of the Xerox machine (popularized in the 1960s) enabled researchers to make a copy of any portion of a journal for a fraction of its cost. This presented a challenge for societies, which depended upon subscription revenues from *both* libraries and individuals to cover their publication costs. Rather than subscribing to a full journal or purchasing a book, a researcher could now visit the library, make copies of the individual articles or segments he/she needed from any journal or book the library maintained, and take those copies home. For researchers, this marked a major improvement in their ability to gather diverse literatures; for University Presses and society publishers, this marked a pain point as units purchased decreased.^[23]

This early challenge was compounded by an increase in disciplinary specialization in the 1960s–1970s (e.g., “physical geography” subdivided into five subdisciplines: geomorphology, climatology, biogeography, soil science, and Quaternary environmental change). With disciplinary specialization came new (competing) societies and journals, which fractured the subscription and membership base for longstanding societies. This also presented an early challenge to the collections budgets for academic libraries, which had to expand their journal collections to encompass the new titles demanded by their researchers.^[24]

The crisis mentality continued to grow—along with scholarly output—as higher education rankings and citation impact measures grew in stature and popularity during the 1970s. Although promotion and tenure already encouraged publication through its inclusion as one key measure of an Assistant or Associate Professor’s performance evaluation for tenure and promotion to full professor, the degree of attention given to publishing in higher education rankings—both for disciplinary departments and across the university—heightened the “publish or perish” pressure. With increased supply (journal articles), more journals rose to fill the increasingly specialized disciplinary spaces. And libraries’ acquisitions expenditures continued to grow to keep pace with the increased academic output.

Another “crisis” snowball came in the form of industry consolidation and market concentration practices, as publishers bought out the weakened societies, and then applied a powerful new market strategy—journal “bundling”—to improve the return on their investments. Bundling practices began with the so-called “Big Deal,” in which libraries promised to maintain their print subscriptions for a number of years in order to rent electronic access to digitized journals, and expanded over time to bundled eJournals. The major conglomerates—Elsevier, Taylor & Francis, Pearson, Wiley—all have their roots in early academic publishing (of the top 12 academic publishers, only Thomson was founded after 1900), and they largely control the journal industry.^[25]

The steep pricing increases for journals (e.g., 600% between 1984 and 2002 for science journals) forced academic libraries worldwide to struggle to meet local user demand for these increasingly expensive journals. Libraries responded by cutting other materials—especially books/monographs—which shifted the immediate crisis onto the shoulders of the University Presses, which primarily published scholarly monographs and edited volumes, and depended upon library-based purchases of those books to meet their basic production costs.^[26]

Although there is much debate about these and other causes (and culprits), most players agree today that the established order of academic publishing has been shaken. In the emerging, increasingly digital, publishing landscape, there is a mix of old and new voices—both within the academy (faculty, students, administrators, university presses, libraries, IT divisions, research centers) and beyond it (societies, nonprofits, commercial publishers, consortia). The groundwork laid by these players today will provide the foundation for the next generation of scholarship—making this a critical moment for scholarly communications.

It is also a critical moment for the Library as an institution. As documented by Walters and Skinner in the 2011 ARL report “New Roles for New Times,” academic libraries are demonstrating the value that information managers (librarians) bring to the full lifecycle of scholarly communications, including digital content production, dissemination, and preservation.^[27] Academic libraries are uniquely positioned to help their parent institutions advance their core missions of producing, sharing, and preserving new knowledge in the digital realm and within this evolving publishing landscape.^[27] Providing services that support scholars’ growing needs in these areas is mission-critical for the Library. Arguably, it is also crucial for the health of the research communities it supports.

ACADEMIC LIBRARY PUBLISHING TODAY

Libraries have a core role on university and college campuses, where they often provide information services to every academic program and department on campus. They are viewed as sources of authoritative information, and they have staff members who are knowledgeable in many aspects of information management, including the creation and hosting of systems designed for its preservation and dissemination. In this context, library publishing services are emerging in a number of forms and in a range of institutional contexts, usually in direct response to faculty and student requests.^[28]

As campus demands for publishing services increase, libraries are formalizing activities that they previously undertook as either grant-based projects or with seed funding from operations budgets.^[28] Where a university press is present (which is now only in about 100 of the

2500 U.S.-based colleges and universities, as one measure), collaborations between the press and library are becoming more prominent, especially on digital publishing activities. In nearly a fifth of these institutions, the university press is being reframed as a formal partner of the library, including through the merging of the university press with the library (see, e.g., Purdue University, University of North Texas, Penn State, Utah State, Syracuse, and Oregon State). Despite the different forms library publishing activities have assumed to date, these programs share a growing commonality of philosophy and approach combining traditional library values and skills (such as a concern with long-term preservation, expertise in the organization of information, and commitment to widening access) with lightweight digital workflows to create a distinctive “field” of publishing activity. As attention to additional content types increases (e.g., “Big Data” and “small data” and everything in between), the value of information management skills in publishing and preserving this content will likewise increase.

Among the emergent focal areas of libraries is hosting a suite of digital publishing services for faculty, staff, and students in support of the research, learning, and engagement goals of the institution. The products disseminated are often (but not always) open access, and they generally include both peer-reviewed electronic publication types such as eJournals and scholarly monographs, and less formally reviewed materials such as technical reports and database-driven websites. Some library publishing programs also include a particular focus on experimental forms of scholarly communication, such as the products of digital humanities research. These new forms of scholarship often involve multimedia components and require innovation in software platforms. Publication of all of these content types requires the establishment of workflows that add value to the raw material.

Missions and Motivations

Publishing has emerged as a strategic service area as libraries identify unmet needs and dissatisfaction with existing processes. Karla Hahn’s 2008 study noted that “library-based publishing programs are pragmatic responses to evident needs, not services in search of clients.”^[20] Libraries receive direct requests from faculty and students who lack sufficient resources within their home departments. Additionally, libraries recognize the value of content that is not published through traditional channels (e.g., gray literature, data, scholarly websites); the need for an alternative to traditional publishing models in response to problems with the current system (e.g., escalating journals prices, restrictive author agreements); and the opportunity to complement existing publishing services on campus, which may have different audiences, goals, and models. Finally, libraries are invested in supporting their stakeholders throughout the academic process.

Methodology and Practices

The LPC project team launched a survey of library publishing practices in Spring 2013, focusing primarily on North America. More than 110 academic libraries provided responses regarding their publishing practices, ambitions, and collaborations. The responses were edited and compiled for publication in the 2014 “Library Publishing Directory,” which provides the first comprehensive view of the publishing support and services offered today by a broad range of academic libraries. A number of important findings regarding current practices in the field emerged from the data collected. Some of that data is reported here, along with findings from previous surveys of the field.

Core Services

Libraries have decades of experience in building, implementing, and maintaining technical infrastructure for digital content. Maintaining the Institutional Repository or publishing platform used to host publications is the basic level of service provision for library publishers.

Other core publishing services build on libraries’ traditional strengths, including facilitating access, discovery, and preservation. In a *Library Journal* interview, Charles Watkinson described libraries’ “strong focus on enriched and standardized metadata, the leveraging of digital repository systems, and integration with other library services, especially those concerned with research data management and special collections.”^[29] The LPC survey supported this description. More than three quarters of respondents said that they provide metadata (85%) and digitization (78%) services, cataloging (67%), DOI assignment (42%), ISSN registration (40%), Open URL support (28%), and analytics (62%). Other services, such as author advisory on copyright (78%) and other subjects (32%), and other types of training (66%), build on librarians’ strengths as educators and advocates.

A smaller, but still substantial number of libraries offer services that support the editorial and production processes that are hallmarks of traditional publishing. These include peer review management (29%), copyediting (23%), typesetting (20%), print-on-demand (16%), and graphic design (42%). Finally, some libraries support business model development (13%), budget preparation (6%), and contract and license preparation (28%).

Organization and Staffing

Library publishers range in size and stature from prominent, well-staffed, institutionally based groups (e.g., Michigan’s MPublishing, Columbia’s Center for Digital Research and Scholarship) to collaborative units across multiple campuses (e.g., the California Digital Library’s eScholarship service) to small programs with great

impacts (e.g., programs at Pacific University and Illinois Wesleyan University). Currently, there is no dominant model for the organization of publishing services in libraries. In many institutions, services are distributed across multiple library units or even across campus. The lead unit varies dramatically (from Scholarly Communications, to Technical Services, to Special Collections). Staffing also varies widely, but the LPC survey demonstrated that operations remain lean. Libraries reported between .1 and 8 full-time equivalent in library staff who are directly involved in publishing services. Many libraries also employ graduate and undergraduate students to support their publishing activities.

Business Models

Libraries support publishing efforts primarily through their operating budgets, though, as Karla Hahn previously reported, libraries typically rely on at least two funding streams, which include “grants, charge-backs to units or organizations, royalties and licensing fees, print-on-demand revenue, and other forms of sales of some kind.”^[20] Because libraries show a strong preference for open access models—95% report being focused mostly (48%) or entirely (45%) on Open Access—most do not rely on subscription or sales revenue to support the bulk of their activities. Libraries are experimenting with a number of ways to make their publishing operations sustainable. Some libraries sell content (either at-cost or for a profit) through e-commerce sites like Amazon.com, through publishing platforms like Tizra and Bibliolabs that support payment, or through their own websites in digital and print-on-demand formats. Libraries are also establishing partnerships with other libraries, non-profits, scholarly societies, and others in order to effectively share resources and distribute costs.

Partnerships and Collaboration

Libraries collaborate with a range of internal and external partners in order to sustain, expand, and enhance their publishing services. Internally, libraries routinely work with individual faculty and students across campus, with specific departments or research centers, and university presses. Library and university press partnerships have been explored in detail, most notably in a 2009 Scholarly Publishing and Academic Resources Coalition (SPARC) report, which offered case studies and considerations for collaboration.^[18] These partnerships range from libraries digitizing backfiles of university press titles to cooperating on the publication of original monograph series.

Externally, libraries work with scholarly societies, non-profits, faculty on other campuses, individual libraries and library consortia, and others. Notable examples of external partnerships include the eJournal *Elementa*, a collaborative endeavor of the non-profit BioOne and five academic

institutions and the Open Folklore Project a collaboration of the American Folklore Society, the Indiana University Libraries, and the IU Digital Library Program.^[30,31]

Maturity

While publishing services have recently attracted much attention, libraries report that they have been offering these services from as early as 1960. According to the recent LPC survey, 10 libraries began publishing in 1999 or before, 14 started between 2000 and 2004, 39 between 2005 and 2009, and 25 since 2010.

HOT TOPICS AND DEBATES

A range of experiments, frictions, and open questions has emerged as this young field defines its boundaries. A few of those are discussed here.

ESTABLISHING CREDIBILITY AND IDENTITY

While library publishing endeavors in some cases resemble traditional scholarly publishing operations, they frequently offer a distinct set of core services, embrace an expanded range of content types, and pursue a different set of goals. These differences prompt reflection on what publishing means in a new scholarly communications landscape. For example, libraries frequently disseminate original content such as ETDs, scholarly websites, and data sets, which do not undergo the processes of editing and review that remain the hallmarks of scholarly publishing. When publishing eJournals, monographs, and other traditional content types, operate with digital-only, Open Access models, and produce on a very small scale. Like other Open Access publishers, libraries are actively working to establish the credibility of their publications and encourage widespread uptake from both content creators and other publishers. Some have objected to the use of the term “library publishing” because it may be used “to ghettoize what’s happening” in libraries, further hindering efforts to be taken seriously by other publishers and the academy.^[32]

Scholarly Publishing and the Academy

The idea that the academy could or should reclaim ownership of the publishing process has generated significant debate in the scholarly and publishing communities. Debates have centered on both the desirability and feasibility of colleges and universities replacing or competing with commercial publishers.^[33] Barriers to achieving significant change to the current scholarly publishing system include the relatively small scale of campus-based publishing operations and the reluctance of scholars to change

their publishing practices (often due to promotion and tenure considerations). A 2012 CLIR/DLF-funded report argued, “If libraries are searching for transformation in scholarly publishing, small, individual efforts will not meet that goal. Collaborative efforts between institutions and with their presses may actually build a critical mass.”^[34]

Relationships with University Presses

As more libraries and university presses explore collaboration, partnerships, and/or administrative ties, there has been discussion of the nature of these relationships and the benefits and challenges of bridging the gaps between the distinct strengths of each. In the 2009 report on library and university press collaborations, Raym Crow noted that, “As their roles continue to evolve, the boundaries separating the activities of the library and the press have become less distinct.”^[18] Libraries have adapted to meet changing scholarly practices and to demonstrate their value to the research enterprise, while presses have responded to changes in publishing, most notably the shift from print to digital. While many examples of successful collaborations exist, a range of tensions and obstacles make this a fraught area. Challenges include the different business models of libraries and presses (the former operates primarily through subsidies, while the latter relies substantially on sales revenue), and structural issues (e.g., reporting lines within universities, and evolving models of collaboration at both system- and campus-based levels).

Sustainability

Libraries operate with a different set of financial expectations from traditional commercial publishers and university presses. Financial support comes primarily from the library’s operating budget. Library publishing services may not be required to turn a profit or even recoup their costs, and the majority does not directly charge content creators for services. Many libraries work with streamlined digital-only or digital and print on demand models that reduce some of the costs of traditional publishing (e.g., maintaining an inventory, investing heavily in marketing). But costs in staff time and technology remain substantial. Particularly given libraries’ preference for Open Access publication, how will libraries ensure that publishing services remain viable in the long-term? Where does money come from to expand services, hire new staff, or invest in new technologies?

CONCLUSION

Over the last few decades, library publishing has evolved from involvement in Institutional Repositories and *ad hoc* digital projects to a full set of services that support the

publication of a range of content types. It has gained traction as a response to the needs of authors and library users and as an outgrowth of libraries' traditional skills and their commitment to supporting scholarship. Today, it is clear that "library publishing" is a meaningful term, one that denotes a growing area of scholarly communication activity.

As this work continues to expand, libraries—like all “publishers”—will continue to confront a difficult and rapidly changing publishing landscape. Libraries today are working to articulate clearly their value proposition and business model(s), and demonstrate how the services and models they offer can help stabilize the scholarly publishing ecosystem. As part of this work, they are also cultivating and strengthening their relationships with each other, as well as with other stakeholders in this space, including scholarly societies and university presses. These strategic alliances will help to ensure that the overall scholarly communication apparatus is able to continue evolving at pace with the research and knowledge produced across academia.

Encyclopedia of Library and Information Sciences, Fourth Edition

Contents

Volume I

Academic Libraries / <i>Susan Curzon and Jennie Quiñónez-Skinner</i>	1
Accessibility / <i>Lori Bell</i>	14
Accreditation of Library and Information Studies Programs in the United States and Canada / <i>Karen Lynn O'Brien</i>	18
Acquisitions Institute at Timberline Lodge / <i>Scott A. Smith</i>	22
African Librarianship / <i>Natalia T. Bowdoin and Janet Lee</i>	33
Altmetrics / <i>Richard Cave</i>	44
American Association of Law Libraries (AALL) / <i>Kate Hagan</i>	48
American Association of Museums (AAM) / <i>Elizabeth E. Merritt</i>	56
American Association of School Librarians (AASL) / <i>Donald C. Adcock</i>	59
American Library Association (ALA) / <i>Mary W. Ghikas</i>	67
American Medical Informatics Association (AMIA) / <i>Don E. Detmer, Tia Abner and Karen Greenwood</i>	85
American National Standards Institute (ANSI) / <i>Jana Zabinski</i>	87
American Society for Information Science and Technology (ASIST) / <i>Charles H. Davis and Debora Shaw</i>	90
Approval Plans / <i>Robert Nardini</i>	96
Arab Federation for Libraries and Information (AFLI) / <i>Nour Soufi</i>	100
Archival Appraisal and Acquisition / <i>Barbara Reed</i>	105
Archival Arrangement and Description / <i>Joanne Evans, Sue McKemmish and Barbara Reed</i>	115
Archival Documentation / <i>Gavan McCarthy and Joanne Evans</i>	127
Archival Finding Aids / <i>Su Kim Chung and Karla Irwin</i>	133
Archival Management and Administration / <i>Michael J. Kurtz</i>	141
Archival Reference and Access / <i>Mary Jo Pugh</i>	149
Archival Science / <i>Elizabeth Shepherd</i>	166
Archives / <i>Adrian Cunningham</i>	179
Archivists and Collecting / <i>Richard J. Cox</i>	195
Area and Interdisciplinary Studies Literatures and Their Users / <i>Lynn Westbrook</i>	209
ARMA International, Inc. / <i>Carol E. B. Choksy</i>	221
Armenia: Libraries, Archives, and Museums / <i>Sylva Natalie Manoogian</i>	228
Art Galleries / <i>Daniel C. Danzig</i>	241
Art Librarianship / <i>Kathryn M. Wayne</i>	249
Art Museums / <i>David Gordon</i>	259

Volume I (*cont'd.*)

Artificial Intelligence / Jianhua Chen	269
Artificial Neural Networks and Natural Language Processing / Hermann Moisl	279
Arts Literatures and Their Users / Lisl Zach	293
ASLIB / David Bawden and Lyn Robinson	301
Association for Information Science and Technology / Diane H. Sonnenwald, Charles H. Davis and Debora Shaw	311
Association for Information Systems (AIS) / William R. King and Dennis Galletta	318
Association for Library Collections and Technical Services / Charles Wilt	324
Association for Library Service to Children (ALSC) / Virginia A. Walter	333
Association of College and Research Libraries (ACRL) / Mary Ellen Davis and Mary Jane Petrowski	338
Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF) / Sally Gardner Reed	361
Association of Research Libraries (ARL) / Lee Anne George and Julia Blixrud	364
Association of Specialized and Cooperative Library Agencies (ASCLA) / Barbara A. Macikas	376
Australia: Libraries, Archives, and Museums / Alex Byrne	379
Australian Library and Information Association (ALIA) / Sue Hutley, Jane Hardy and Judy Brooker	396
Authentication and Authorization / David Millman	401
Automated Acquisitions / Patricia A. Smith and Allison V. Level	408
Automatic Abstracting and Summarization / Daniel Marcu	418
Automatic Discourse Generation / John A. Bateman	430
Back-of-the-Book Indexing / Nancy C. Mulvany	440
Bibliographic Control [ELIS Classic] / Robert L. Maxwell	447
Bibliographical Society (London) / Julian Roberts	456
Bibliographical Society of America (BSA) / Hope Mayo	463
Bibliography / D. W. Krummel	468
Bibliometric Overview of Information Science / Howard D. White	480
Bibliometric Research: History [ELIS Classic] / Dorothy H. Hertz	492
Bibliothèque Nationale de France / Noémie Lesquins	531
Binding [ELIS Classic] / Lawrence S. Thompson	538
Biological Information and Its Users / Kalpana Shankar	554
Blind and Physically Disabled: Library Services / Jane Rosetta Virginia Caulton and Stephen Prine	563
Bliss Bibliographic Classification First Edition [ELIS Classic] / Jack Mills	573
Bliss Bibliographic Classification Second Edition / Vanda Broughton	581
Boolean Algebras [ELIS Classic] / A. R. Bednarek	591
Brazil: Library Science / Mariza Russo	597
Brazil: Library Science—Distance Education / Mariza Russo	603
Brazil: Museums / Regina Dantas and Pamela Howard-Reguindin	611
British Library / Andy Stephens	616
Business Informatics / Markus Helfert	630
Business Information and Its Users / Eileen G. Abels	635
Business Literature: History [ELIS Classic] / Edwin T. Coman, Jr.	643
Canada: Libraries and Archives / Ian E. Wilson and Sean F. Berrigan	654
Canadian Heritage Information Network (CHIN) / Shannon Ross and Paul M. Lima	675
Canadian Library Association (CLA) / Donald I. Butcher	681
Careers and Education in Archives and Records Management / Karen Anderson	685
Careers and Education in Information Systems / Paul Gray and Lorne Olfman	693

Volume I (*cont'd.*)

Careers and Education in Library and Information Science / <i>Jana Varlejs</i>	706
Careers and Education in Records and Information Management / <i>Carol E. B. Choksy</i>	715

Volume II

Cataloging / <i>Daniel N. Joudrey</i>	723
Cataloging Cultural Objects (CCO) / <i>Elizabeth O'Keefe and Maria Oldal</i>	733
Catalogs and Cataloging: History [<i>ELIS Classic</i>] / <i>Eugene R. Hanson and Jay E. Daily</i>	743
Censorship and Content Regulation of the Internet / <i>Peng Hwa Ang</i>	780
Center for Research Libraries / <i>Mary I. Wilke</i>	789
Charleston Conference / <i>Katina Strauch</i>	794
Chartered Institute of Library and Information Professionals (CILIP) / <i>Tim Owen</i>	806
Chemistry Literature and Its Users [<i>ELIS Classic</i>] / <i>Judith N. Currano</i>	814
Chemoinformatics / <i>Peter Willett</i>	830
Children and Information Technology / <i>June Abbas</i>	839
Children's Literature / <i>Judith V. Lechner</i>	852
Children's Services in Libraries / <i>Virginia A. Walter and Melissa Gross</i>	876
China: Libraries, Archives, and Museums / <i>Priscilla C. Yu and TzeHuey Chiou-Peng</i>	886
Circulation Services / <i>Vanessa Irvin and Jeff E. Bullard</i>	916
Citation Analysis / <i>Howard D. White</i>	923
Citation Indexes and the <i>Web of Science</i> / <i>Marie E. McVeigh</i>	940
Citer Motivations [<i>ELIS Classic</i>] / <i>Terrence Brooks</i>	951
Classification Theory / <i>Clare Beghtol</i>	958
Clinical Decision-Support Systems / <i>Kai Zheng</i>	974
College Libraries / <i>Thomas G. Kirk, Jr.</i>	983
Communication and Communication Studies / <i>Brenda Dervin and CarrieLynn D. Reinhard</i>	994
Communication Policy: United States / <i>D. Linda Garcia</i>	1007
Community Informatics / <i>Kate Williams and Joan C. Durrance</i>	1027
Complexity and Self-Organization / <i>Francis Heylighen</i>	1034
Computer-Mediated Communication (CMC) / <i>Michael A. Chilton and Roger McHaney</i>	1044
Computer-Supported Cooperative Work (CSCW) / <i>Kevin L. Mills</i>	1053
Conservation and Preservation of Museum Objects / <i>Ellen Pearlstein</i>	1068
Controlled Vocabularies for Art, Architecture, and Material Culture / <i>Murtha Baca</i>	1076
Corporate Archives / <i>Philip Mooney</i>	1081
Corporate Art Collections / <i>Laura Matzer</i>	1086
Corporate Information Centers / <i>Barbara M. Spiegelman and Nancy Flury Carlson</i>	1094
Corporate Records Management / <i>Barbara M. Cross and Barbara E. Nye</i>	1104
Credibility and Cognitive Authority of Information / <i>Soo Young Rieh</i>	1113
Croatia: Libraries, Archives, and Museums / <i>Aleksandra Horvat, Josip Kolanović and Višnja Zgaga</i>	1121
CrossRef Publisher Linking Network / <i>Amy E. Brand</i>	1132
Cultural Memory / <i>Robert DeHart</i>	1139
Curating Archaeological Artifacts / <i>Alex W. Barker</i>	1147
Curating Natural History Collections / <i>Kimberly S. Bostwick</i>	1156
Custody and Chain of Custody / <i>Bernadette G. Callery</i>	1164
Data and Data Quality / <i>Thomas C. Redman and Christopher Fox and Anany Levitin</i>	1171
Deaf and Hearing Impaired: Communication in Service Contexts [<i>ELIS Classic</i>] / <i>Warren R. Goldmann</i>	1183

Volume II (*cont'd.*)

Decision Sciences / <i>Sven Axsäter and Johan Marklund</i>	1192
Decision Support Systems / <i>Marek J. Druzdzel and Roger R. Flynn</i>	1200
Demand-Driven Acquisition/Patron-Driven Acquisition / <i>Michael Levine-Clark</i>	1209
Denmark: Libraries, Archives, and Museums / <i>Jens Thorhauge, Jakob Heide Petersen and Ole Magnus Mølbak Andersen</i>	1215
Descriptive Cataloging Principles / <i>Elena Escolano Rodríguez</i>	1229
Design Science in the Information Sciences / <i>Judith Weedman</i>	1242
Dewey Decimal Classification (DDC) / <i>Joan S. Mitchell and Diane Vizine-Goetz</i>	1256
Digital Content Licensing / <i>Paul D. Callister and Kathleen Hall</i>	1267
Digital Divide and Inclusion / <i>Mark Warschauer and Melissa Niiya</i>	1279
Digital Humanities / <i>Julia Flanders and Elli Mylonas</i>	1286
Digital Humanities and Academic Libraries / <i>Bobby Smiley and Michael Rodriguez</i>	1298
Digital Images / <i>Melissa Terras</i>	1307
Digital Millennium Copyright Act of 1998 / <i>Jonathan A. Franklin</i>	1316
Digital Object Identifier (DOI®) System / <i>Norman Paskin</i>	1325
Digital Preservation / <i>Jacob Nadal</i>	1332
Diplomatics / <i>Luciana Duranti</i>	1338
Disaster Planning and Recovery for Cultural Institutions / <i>Sheryl Davis, A. Patricia Smith-Hunt and Kristen Kern</i>	1347
Document Information Systems / <i>K. van der Meer</i>	1360
Document Theory / <i>Niels Windfeld Lund and Roswitha Skare</i>	1372
Document Type Definition (DTD) / <i>Judith Wusteman</i>	1381
Dublin Core Metadata Initiative (DCMI): A Personal History / <i>Stuart L. Weibel</i>	1390
Economics Literature: History [ELIS Classic] / <i>Arthur H. Cole and Laurence J. Kipp</i>	1399
Electronic Records Preservation / <i>Robert P. Spindler</i>	1413
Electronic Resources & Libraries (ER&L) / <i>Jesse Koennecke</i>	1419
Encoded Archival Description / <i>Daniel Pitti and Michael Rush</i>	1423
Engineering Literatures and Their Users [ELIS Classic] / <i>Thomas E. Pinelli, Ann P. Bishop, Rebecca O. Barclay and John M. Kennedy</i>	1433

Volume III

Epistemology / <i>Paul K. Moser</i>	1455
Ethical and Legal Aspects of Archival Services / <i>Sara S. Hodson</i>	1463
Ethical Aspects of Library and Information Science / <i>Richard Rubin and Thomas J. Froehlich</i>	1469
Ethical Issues in Information Systems / <i>Vladimir Zwass</i>	1484
Ethiopia: Libraries, Archives, and Museums / <i>Shiferaw Assefa</i>	1494
Everyday Life Information Seeking / <i>Reijo Savolainen</i>	1506
Evidence-Based Practice / <i>Prudence W. Dalrymple</i>	1516
Exhibition Design / <i>Lee H. Skolnick, Dan Marwit and Jo Ann Secor</i>	1523
Facet Analysis [ELIS Classic] / <i>Douglas J. Foskett</i>	1534
Faceted Application of Subject Terminology (FAST) / <i>Eric R. Childress and Diane Vizine-Goetz</i>	1539
Federal Electronic Information in the United States / <i>Carol D. Doyle</i>	1549
Film and Broadcast Archives / <i>Karen F. Gracy and Karen E. King</i>	1560
Film Archiving: History / <i>Steve Ricci</i>	1584
France: Archives, Museums, and Libraries / <i>Martine Poulain</i>	1589

Volume III (*cont'd.*)

Functional Requirements for Subject Authority Data (FRSAD): Conceptual Model / <i>Marcia Lei Zeng, Athena Salaba and Maja Žumer</i>	1606
Fuzzy Set Theory / <i>Donald Kraft, Gloria Bordogna and Gabriella Pasi</i>	1618
Games and Gaming / <i>Diane Robson and Breanne A. Kirsch</i>	1636
Genealogical Literature and Its Users / <i>Mavis B. Molto</i>	1644
Genre Theory and Research / <i>Catherine F. Schryer</i>	1662
Geographic Information Systems (GIS) / <i>Timothy F. Leslie and Nigel M. Waters</i>	1671
Geographical Literature: History [ELIS Classic] / <i>Nora T. Corley</i>	1683
Germany: Libraries, Archives, and Museums / <i>Claudia Lux</i>	1693
Global Open Knowledgebase / <i>Kristen Wilson</i>	1710
Government Documents: Collection and Management / <i>Aimée C. Quinn, Lori Smith and James Church</i>	1715
Greece: Archives / <i>Nestor Bamidis</i>	1728
Greece: Libraries / <i>Anestis Sitas and Mersini Moreleli-Cacouris</i>	1733
Greece: Museums / <i>Maria Economou</i>	1741
Grey Literature [ELIS Classic] / <i>Joachim Schöpfel and Dominic J. Farace</i>	1746
HathiTrust / <i>Rick Anderson</i>	1757
Health Science Professional Literatures and Their Users / <i>Cheryl Dee and Jocelyn Rankin</i>	1763
Historical and Archaeological Sites: Development and Preservation / <i>Robert B. Pickering</i>	1771
Historical Societies / <i>Mark Sgambettera</i>	1779
Historical Sources and Their Users / <i>Margaret Stieg Dalton</i>	1786
History of Libraries / <i>John Mark Tucker and Edward A. Goedeken</i>	1796
History of Museums / <i>John Edward Simmons</i>	1812
History of Paper / <i>Sidney E. Berger</i>	1824
History of Public Libraries [ELIS Classic] / <i>Frank B. Sessa</i>	1836
History of Records and Information Management / <i>William Benedon</i>	1850
History of the Book / <i>Jonathan Rose</i>	1859
History: Three Basic Printing Processes / <i>Sidney E. Berger</i>	1865
Hospital Libraries / <i>Rosalind K. Lett</i>	1870
Human-Computer Interaction Research in Information Retrieval / <i>Shin-jeng Lin</i>	1895
Humanities Literatures and Their Users / <i>Stephen E. Wiberley, Jr.</i>	1909
Hungary: Libraries, Archives, and Museums / <i>Katalin Radics</i>	1917
Hypertext and Hypercard: Early Development [ELIS Classic] / <i>Susan K. Kinnell and Carl Franklin</i>	1935
Illumination [ELIS Classic] / <i>Abdul Moid</i>	1945
Impact Assessment of Cultural Institutions / <i>Sara Selwood</i>	1958
Incunabula [ELIS Classic] / <i>John P. Immroth and Romano Stephen Almagno</i>	1966
Indexing: History and Theory / <i>Bella Hass Weinberg</i>	1978
India: Libraries, Archives and Museums / <i>Krishan Kumar, V. Jeyaraj and Ramesh C. Gaur</i>	1992
Indigenous Librarianship / <i>Kathleen Burns, Ann Doyle, Gene Joseph and Allison Krebs</i>	2031
Information / <i>Marcia J. Bates</i>	2048
Information Arts / <i>Christiane Paul and Jack Toolin</i>	2064
Information Behavior / <i>Marcia J. Bates</i>	2074
Information Behavior Models / <i>Thomas D. Wilson</i>	2086
Information Crises and Crisis Information / <i>Philippe Baumard</i>	2094
Information Explosion / <i>Ronald E. Day</i>	2101
Information Management / <i>Brian Detlor</i>	2106
Information Needs / <i>Charles M. Naumer and Karen E. Fisher</i>	2115

Volume III (*cont'd.*)

Information Needs and Behaviors of Diasporic Populations / <i>Ajit K. Pyati</i>	2122
Information Needs and Behaviors of Populations in Less Developed Regions / <i>Innocent I. Ekoja</i>	2130
Information Policy: European Union / <i>Debbie Rabina and Scott Johnston</i>	2138
Information Policy: United States / <i>Peter Hernon and Harold C. Relyea</i>	2147
Information Practice / <i>Crystal Fulton and Jean Henefer</i>	2162
Information Retrieval Experimentation [ELIS Classic] / <i>Jean Tague-Sutcliffe</i>	2172

Volume IV

Information Retrieval Protocols: Z39.50 and Search and Retrieve via URL / <i>William Moen</i>	2181
Information Retrieval Support Systems / <i>Yiyu Yao, Ning Zhong and Yi Zeng</i>	2192
Information Retrieval Systems / <i>Ray R. Larson</i>	2199
Information Scattering / <i>Suresh K. Bhavnani and Concepción S. Wilson</i>	2210
Information Science / <i>Tefko Saracevic</i>	2216
Information Search Process (ISP) Model / <i>Carol Collier Kuhlthau</i>	2232
Information Searching and Search Models / <i>Iris Xie</i>	2239
Information Society / <i>Frank Webster</i>	2253
Information Systems / <i>E. Burton Swanson</i>	2272
Information Systems Failure / <i>Chris Sauer and Gordon B. Davis</i>	2280
Information Technology Adoption / <i>Conrad Shayo</i>	2290
Information Technology Literacy / <i>James W. Marcum and Denise I. O'Shea</i>	2303
Information Technology Project Implementation in Developing Countries [ELIS Classic] / <i>Athanase B. Kanamugire</i>	2312
Information Technology Standards for Libraries [ELIS Classic] / <i>Christinger Tomer</i>	2341
Information Theory / <i>Paul B. Kantor</i>	2350
Information Use for Decision Making / <i>Edward T. Cokely, Lael J. Schooler and Gerd Gigerenzer</i>	2359
Informetrics / <i>Judit Bar-Ilan</i>	2367
Institutional Records and Archives / <i>David Farneth</i>	2377
Intellectual Freedom and the American Library Association (ALA): Historical Overview [ELIS Classic] / <i>Judith F. Krug</i>	2387
Intelligence and Security Informatics / <i>Hsinchun Chen, Zhenhua Lai, Yan Dang and Yulei Zhang</i>	2398
International and Comparative Librarianship / <i>Peter Johan Lor</i>	2404
International Association of Sound and Audiovisual Archives (IASA) / <i>Ilse Assmann</i>	2413
International Association of Technological University Libraries (IATUL) / <i>Nancy Fjällbrant and Alice Trussell</i>	2418
International Communication Association (ICA) / <i>Ronald E. Rice</i>	2421
International Council of Museums (ICOM) / <i>Patrick J. Boylan</i>	2429
International Council on Archives (ICA) / <i>Perrine Canavaggio and Marcel Caya</i>	2437
International Council on Knowledge Management (ICKM) / <i>Franz Barachini</i>	2445
International Federation of Library Associations and Institutions (IFLA) / <i>Ross Shimmon,</i> <i>Peter Johan Lor, Sofia Kapnisi, Sjoerd Koopman and Stuart Hamilton</i>	2451
International Federation of Television Archives (FIAT/IFTA) / <i>Steve Bryant</i>	2465
International Organization for Standardization (ISO) / <i>Alan Bryden and Catherine Dhérent</i>	2470
International Records Management Standards ISO 15489 and 23081 / <i>Barbara Reed</i>	2481

Volume IV (*cont'd.*)

International Records Management Trust / Anne Thurston	2487
International Society for Knowledge Organization (ISKO) / Ingetraut Dahlberg	2494
Internet Genres / Kevin Crowston	2503
Internet Search Tools: History to 2000 / Dale J. Vidmar and Connie J. Anderson-Cahoon	2516
InterPARES / Luciana Duranti	2526
iSchools / Ronald L. Larsen	2536
Israel: Libraries, Archives, and Museums / Snunith Shoham and Silvia Schenkolewski-Kroll	2542
Japan: Libraries, Archives, and Museums / Masaya Takayama, Yoriko Miyabe, Toru Koizumi and Hiroyuki Hatano	2560
Kazakhstan: Libraries, Archives, and Museums / Leslie Champeny, Joseph Luke, Anna Bergaliyeva and Olga Zaitseva	2578
Kenya: Libraries, Museums, and Archives / Irene Muthoni Kibandi, Pancras Kimaru, Caroline Kayoro, Philomena Kagwiria Mwirigi, Sophie Ndegwa, Nelson Otieno Karilus, Charles Nzivo, Linda Mboya and Lilian Gisesa	2592
Knowledge / Paul K. Moser and Arnold vander Nat	2610
Knowledge Creation and Use in Organizations / Maija-Leena Aulikki Huotari and Anna Suorsa	2618
Knowledge Discovery in Data Streams / Xuan Hong Dang and Kok-Leong Ong	2626
Knowledge Management / Kimiz Dalkir	2640
Knowledge Management Systems / Dick Stenmark	2649
Knowledge Management: Early Development / Michael Koenig and Ken Neveroski	2657
Knowledge Organization System Standards / Stella G. Dextre Clarke	2665
Knowledge: Tacit and Explicit / Philippe Baumard	2677
Latent Semantic Indexing / Dian I. Martin and Michael W. Berry	2688
Latinos and U.S. Libraries: History / Romelia Salinas	2698
Law Firm Librarianship / Brenda A. Burton, Mary B. Eggert and Clara C. Mosquera	2705
Law Librarianship / Richard A. Danner, Mark E. Estes and Judith Adams Meadows	2710
Law Literature and Its Users / Penny Hazelton	2733
Learning and Information Seeking / Louise Limberg and Mikael Alexandersson	2751
Libraries / Jennifer Weil Arns	2762
Library and Information Science / Miriam E. Sweeney and Leigh S. Estabrook	2768
Library and Information Technology Association (LITA) / Rachel E. Vacek	2775
Library Anxiety / Diane Mizrachi	2782
Library Architecture and Design / Charlene S. Hurt and Thomas L. Findley	2788
Library Architecture: History / Nan Christian Ploug Dahlkild	2797
Library Automation: History / Robert M. Hayes	2810
Library Consortia in Europe / Tommaso Giordano	2822
Library Fundraising and Development / Susan K. Martin	2832
Library Leadership and Management Association (LLAMA) / Robert Allen Daugherty	2841
Library of Congress Classification (LCC) / Lois Mai Chan and Theodora L. Hodges	2847
Library of Congress Genre/Form Terms for Library and Archival Materials / Janis L. Young	2856
Library of Congress Subject Headings (LCSH) / Janis L. Young	2866
Library of Congress: History / John Y. Cole	2879
Library Portals and Gateways / Frank Cervone	2892
Library Publishing Initiatives: North America / Katherine Skinner and Sarah Lippincott	2901

Volume V

Library Science in the United States: Early History / <i>John V. Richardson, Jr.</i>	2909
Library Technical Services / <i>Doris S. Helfer and Helen Heinrich</i>	2918
Linguistics and the Information Sciences / <i>John C. Paolillo</i>	2927
Linked Data / <i>Jeremy Myntti</i>	2938
Lithuania: Libraries and Librarianship / <i>Elena Macevičiūtė</i>	2943
Louvre / <i>Bette W. Oliver</i>	2958
Machine Readable Cataloging (MARC): 1961–1974 [ELIS Classic] / <i>Henriette D. Avram</i>	2963
Machine Readable Cataloging (MARC): 1975–2007 / <i>Sally H. McCallum</i>	2980
Makerspaces in Libraries / <i>Patrick Tod Colegrove</i>	2990
Management of Very Large Distributed Shared Collections [ELIS Classic] / <i>Reagan W. Moore</i>	2997
Managing an Information Business / <i>Gloria Dinerman</i>	3004
Marketing Library and Information Services / <i>Dinesh K. Gupta and Réjean Savard</i>	3011
Mathematics Literature: History [ELIS Classic] / <i>Barbara Schaefer</i>	3019
Medical Library Association (MLA) / <i>Carla J. Funk</i>	3033
Medical Literature: History [ELIS Classic] / <i>William K. Beatty</i>	3041
Metadata and Digital Information [ELIS Classic] / <i>Jane Greenberg</i>	3058
Metamarkup Languages: SGML and XML / <i>Airi Salminen</i>	3072
Mexico: Libraries, Archives, and Museums / <i>Jesús Lau</i>	3082
Modeling Documents in Their Context / <i>Airi Salminen</i>	3105
Moldova: Archives, Museums, and Libraries / <i>Hermina G.B. Anghelescu,</i> <i>Silviu Andries-Tabac and Elena Ploșniță</i>	3117
Moving Image Indexing / <i>James M. Turner</i>	3129
Multilingual Information Access / <i>Douglas W. Oard</i>	3140
Museum Accreditation Program / <i>Leah Arroyo and Julie Hart</i>	3146
Museum Architecture and Gallery Design / <i>Volker M. Welter</i>	3148
Museum Collecting and Collections / <i>Robert B. Pickering</i>	3161
Museum Computer Network (MCN) / <i>Marla Misunas and Richard Urban</i>	3170
Museum Informatics / <i>Paul F. Marty</i>	3176
Museum Management / <i>Gary Edson</i>	3185
Museum Registration and Documentation / <i>Dixie Neilson</i>	3199
Museum Studies / <i>Marjorie Schwarzer</i>	3214
Museum Web Sites and Digital Collections / <i>David Bearman and Jennifer Trant</i>	3222
Museums / <i>Leslie Madsen-Brooks</i>	3233
Museums and Community / <i>Tamara Biggs</i>	3243
Museums and Their Visitors: Historic Relationship / <i>Samuel J. Redman</i>	3251
Museums as Place / <i>Peter Davis and Han-Yin Huang</i>	3258
Music Information Retrieval / <i>Kjell Lemström and George Tzanetakis</i>	3267
Music Librarianship / <i>Holly Gardinier, Sarah R. Canino and Carl Rahkonen</i>	3275
Name Authority Control / <i>Janifer Gatenby and Karen Smith-Yoshimura</i>	3288
National Archives / <i>Helen Forde</i>	3298
National Biological Information Infrastructure (NBII) / <i>P. Bryan Heidorn and Annette Olson</i>	3306
National Historical Publications and Records Commission (NHPRC) / <i>Keith Donohue</i>	3315
National Libraries / <i>Ian McGowan</i>	3320
National Library of Medicine / <i>Kathel Dunn</i>	3334
Natural Language Processing for Information Retrieval / <i>Elizabeth D. Liddy</i>	3346
Network Management / <i>Robert J. Sandusky</i>	3356

Volume V (*cont'd.*)

Network of European Museum Organisations (NEMO) / Frank Birkebæk	3365
Networked Knowledge Organization Systems/Services (NKOS) / Marianne Lykke	3366
New Zealand Aotearoa: Libraries / Heather M. Lamond	3371
Non-governmental Organizations and Information / Lynne M. Rudasill and Steve W. Witt	3380
North American Serials Interest Group / Jill Emery	3388
OCLC: A Worldwide Library Cooperative / Jay Jordan	3392
Older Adults' Information: Needs and Behavior / Kirsty Williamson and Terry Asla	3406
One-Person Libraries / Judith A. Siess	3413
Online Catalog Subject Searching / Danny C.C. Poo and Christopher S.G. Khoo	3422
Online Library Instruction / Beth Evans	3432
Online Public Access Catalogs (OPACs) [ELIS Classic] / Kevin Butterfield	3450
Ontologies and Their Definition / Jos de Bruijn and Dieter Fensel	3455
Open Access Scholarship and Publishing / Malcolm Getz	3465
Open Archival Information System (OAIS) Reference Model / Christopher A. Lee	3477
Open Source Software / Michael Tiemann	3488
Oral History in Libraries and Archives / Debra Gold Hansen	3494
ORCID / Laurel L. Haak	3505
Organization Theories / Evelyn Daniel	3510
Organizational Culture / Gunilla Widén-Wulff	3520
Organizational Learning / Erica Wiseman	3526
Organizational Memory / Maureen L. Hammer	3534
Pacific Islands Association of Libraries and Archives (PIALA) / Arlene Cohen	3541
Papyrology / Roger S. Bagnall	3552
Patents and Patent Searching / Michael J. White	3560
People with Disabilities / Amelia Koford	3573
Personal Information Management / William Jones, Jesse David Dinneen, Robert Capra, Anne R. Diekema and Manuel A. Pérez-Quinones	3584
Peru: Libraries and Library Science / Sergio Chaparro-Univazo	3606
Philosophy and the Information Sciences / Jonathan Furner	3610
Philosophy of Science [ELIS Classic] / Paul Evan Peters	3623

Volume VI

Physical Sciences and Mathematics Literatures and Their Users / Cecelia Brown	3637
Piracy in Digital Media / Stephanie Walker	3649
Plagiarism of Print and Electronic Resources / Zorana Ercegovac	3664
Poland: Libraries and Archives / Jadwiga Woźniak-Kasperek	3674
Politics of Representation in Museums / Louise Tythacott	3688
Popular Literature Genres / Barry Trott	3700
Precision and Recall [ELIS Classic] / F. W. Lancaster	3708
Presidential Libraries / Sharon Fawcett	3714
Primary Records: Future Prospects [ELIS Classic] / G. Thomas Tanselle	3719
Print on Demand / Steve Bosch	3733
Private Presses and Fine Printing [ELIS Classic] / Roderick Cave	3738
Provenance of Archival Materials / Shelley Sweeney	3746
Provenance of Museum Objects / Layna White	3756

Volume VI (*cont'd.*)

Provenance of Rare Books / <i>Marcia Reed</i>	3766
Public Librarianship [ELIS Classic] / <i>Kathleen de la Peña McCook and Katharine J. Phenix</i>	3774
Public Libraries [ELIS Classic] / <i>Barbara H. Clubb</i>	3781
Public Library Association (PLA) / <i>Louisa Worthington and Kathleen Hughes</i>	3801
Qualitative Research Methods in Library and Information Science [ELIS Classic] / <i>Brett Sutton</i>	3806
Rare Book Collections / <i>Andrew J. Berner</i>	3820
Reading and Reading Acquisition / <i>Brian Byrne</i>	3830
Reading Disorders / <i>H.L. Swanson</i>	3841
Reading Interests / <i>Catherine Sheldrick Ross</i>	3850
Recommender Systems and Expert Locators / <i>Derek L. Hansen, Tapan Khopkar and Jun Zhang</i>	3860
Records Compliance and Risk Management / <i>Bradley J. Wiles</i>	3869
Records Continuum Model / <i>Sue McKemmish, Franklyn Herbert Upward and Barbara Reed</i>	3874
Records Organization and Access / <i>Sue Myburgh</i>	3887
Records Retention Schedules / <i>Barbara E. Nye</i>	3892
Reference and Informational Genres / <i>Thomas Mann</i>	3897
Reference and User Services Association (RUSA) / <i>Barbara A. Macikas</i>	3908
Reference Services / <i>Linda C. Smith</i>	3912
Regional Library Networks: United States / <i>Catherine C. Wilt</i>	3920
Relevance in Theory / <i>Howard D. White</i>	3926
Relevance Judgments and Measurements / <i>Erica Cosijn</i>	3940
Renaissance Libraries [ELIS Classic] / <i>Lawrence S. Thompson</i>	3948
Resource Description Framework (RDF) / <i>Nicholas Gibbins and Nigel Shadbolt</i>	3961
Saudi Arabia: Libraries, Archives, and Museums / <i>Ayman Shabana</i>	3970
Scholarly and Trade Publishing [ELIS Classic] / <i>Richard Abel</i>	3982
School Librarianship / <i>Blanche Woolls</i>	3991
School Libraries / <i>Blanche Woolls</i>	4000
Science and Engineering Librarianship / <i>Margaret Ann Mellinger</i>	4008
Science and Technology Studies / <i>Sanna Talja</i>	4020
Search Engine Optimization / <i>Nicholas Carroll</i>	4029
Search Engines / <i>Randolph Hock</i>	4046
Self-Publishing Online / <i>Caryn Wesner-Early</i>	4054
Semantic Interoperability / <i>Marcia Lei Zeng and Lois Mai Chan</i>	4062
Semantic Web / <i>Kieron O'Hara and Wendy Hall</i>	4080
Semiotics / <i>Marcel Danesi</i>	4094
Senegal: Libraries, Archives, and Museums / <i>Bernard Dione and Dieyi Diouf</i>	4104
Sense-Making / <i>Brenda Dervin and Charles M. Naumer</i>	4113
Serbia: Libraries, Archives, and Museums / <i>Staša Milojević</i>	4125
Serials Collection and Management [ELIS Classic] / <i>Sarah Sutton</i>	4139
Serials Vendors [ELIS Classic] / <i>Karalyn Kavanaugh</i>	4150
Shared Libraries / <i>Ruth E. Kifer and Jane E. Light</i>	4158
Site Museums and Monuments / <i>Destinee Kae Swanson</i>	4164
Slovakia: Libraries, Archives, and Museums / <i>Jela Steinerová, Juraj Roháč and Gabriela Podušelová</i>	4173
Smithsonian Institution / <i>Pamela M. Henson</i>	4188
Social Epistemology / <i>Steve Fuller</i>	4197
Social Influences on Classification / <i>Hope A. Olson</i>	4204
Social Informatics / <i>Howard Rosenbaum</i>	4212

Volume VI (*cont'd.*)

Social Justice in Library and Information Science / <i>Bharat Mehra, Kevin S. Rioux and Kendra S. Albright</i>	4218
Social Networks and Information Transfer / <i>Caroline Haythornthwaite</i>	4235
Social Science Literatures and Their Users [ELIS Classic] / <i>David Ellis</i>	4246
Social Science Professional Literatures and Their Users / <i>Lynn Westbrook</i>	4255
Society for Scholarly Publishing (SSP) / <i>Judy C. Holoviak, October R. Ivins and Lois Smith</i>	4262

Introduction to the Encyclopedia of Library and Information Sciences, Fourth Edition

How to Use This Encyclopedia

Entries are arranged alphabetically in this encyclopedia (see end papers for alphabetical list). The editors of this edition (ELIS-4) have decided to forego the Topical Table of Contents that was provided in ELIS-3 by editors Marcia Bates and Mary Niles Maack. At the time of publication of ELIS-3, the Topical TOC was crucial for readers to get a sense of how subjects were grouped and an understanding of the field or subfield through the clustering of categorical entries in the print edition. ELIS-4 is envisioned as a primarily online reference work where a Topical TOC does not serve the same purpose. The print edition is served well by the main TOC as well as the detailed index, while entries in the online version are easily discoverable through title, author, keyword, and full text searches.

In sum, relevant entries can be found by

1. Entry title (alphabetical arrangement of entries in the encyclopedia or listing in the end papers)
2. Specific name or keyword, including the index at the end of each volume

If the first name or keyword searched is not found, try several more variations—either different words or a different order of words. Most topics are described in several ways in the literature of a discipline, and the first term or phrase that comes to mind may not be the one used here.

Scope of the Encyclopedia

The title of the third edition, *Encyclopedia of Library and Information Sciences*, ended with the letter “s” because the encyclopedia was broadened to cover a spectrum of related and newly emerging information disciplines, including archival science, document theory, informatics, and records management, among others. The fourth edition continues this trend but with an extensive focus on the aspects of library and information sciences that have been heavily impacted by the adoption and reliance on online information distribution. This focus is reflected in the inclusion of numerous new entries such as digital preservation, altmetrics, web-scale discovery services, demand-driven acquisitions, and global open knowledgebases. Alongside these entries based on entirely new topics, the expanded use of the Internet for information has led to new treatment of traditional LIS topics such as resource description and access (RDA) that reflects the adoption of new standards for cataloging.

ELIS-4 also seeks to build upon the description of professional practice to round out the theoretical perspective that previous editions covered very well. Both current editors are academic research librarians and thus, focused heavily on addressing gaps in the encyclopedia related to academic research information while still relying heavily on the structure established by editors of ELIS-3. For example, ELIS-3 introduced country profiles and ELIS-4 builds upon that with new entries for New Zealand and a third on Brazil, in addition to revisions for Slovakia, Netherlands, Canada, Belarus, Kazakhstan, and Brazil among others. This edition also expands the number of entries for named cultural and information entities that did not appear in previous editions, such as the National Library of Medicine, North American Serials Interest Group (NASIG), the International Association of Scientific, Technical and Medical Publishers (STM), and ASLIB, as well as entities like the HathiTrust that have been established since the last edition was published. A number of new entries describing important information conferences such as the Acquisitions Institute at Timberline, the Charleston Conference, and Electronic Resources in Libraries (ER&L) also help round out the encyclopedia and further the description of the current state of academic research librarianship.

ELIS-4 also continues the tradition of designating important entries of historical or theoretical importance as “ELIS Classics.” These are entries by major figures in the library and information sciences or those that describe core concepts in LIS theory, practice, or education that appeared in earlier editions of the encyclopedia. The current editors preserved the approximately 40 previous “ELIS Classics” and designated 13 previous entries as new “ELIS Classics.”

There are more than 550 entries, of which more than 20 are new, another 93 are revisions to prior entries that have been brought up to date by their authors or by new authors, about 30 are ELIS Classics, and about 400 are reprinted from an earlier edition since they have remained relevant to the present. It is important to note that the editors also had to make some choices related to retiring entries that were no longer relevant—due to the passage of time and the development of the field, the technologies and theories described in those entries were deemed to be out of scope for the new edition and thus not revised or reprinted.

Encyclopedia Authors

As in past editions, the authors writing for the encyclopedia are major researchers, librarians and practitioners, and leaders in the fields and subfields in the disciplines in which they are writing. Noted scholars are well represented, and a number of authors are former leaders in LIS associations, including the American Library Association (ALA), the Association for College and Research Libraries (ACRL), the International Federation of Library Associations and Institutions (IFLA), the American Society for Information Science and Technology (ASIS&T), and the American Association of Library and Information Science Education (ALISE). In addition, there are many contributors who are current or former directors of major institutions. As in past editions, the editors are very proud of the range and diversity of authors who have written these entries for the encyclopedia and we thank them for sharing their expertise with the current and future readers and researchers in the field.

Finally, the editors for ELIS-4 have grappled with the challenges of entry generation that was noted by previous editors in nearly every edition: that not all ideas, topics, and potential entries were able to be completed for publication in this edition. While we made a valiant attempt to include entries identified by ELIS-3 editors but not secured for publication in that edition, we sometimes could not find authors willing to take those topics on. Similarly, we were sometimes unable to secure revisions to entries from new authors when previous authors were unable to perform that task. To the greatest extent possible, we endeavored to replace authors when entries were deemed important enough to appear in ELIS-4 but initial or previous authors had to decline or defaulted. No doubt, the editors of ELIS-5 will also pick up the mantle and attempt to round out the encyclopedia with entries for anything that ELIS-4 missed. As noted by editors Bates and Niles Maack in ELIS-3, this problem of missing topics was also acknowledged by Allen Kent, editor of the first edition of ELIS. Kent stated in 1973, "I have prepared this presentation to make sure the lessons of Diderot-d'Alembert are recalled in terms of encyclopedia-making as an exercise in the art of the possible."

Background and Development of the Encyclopedia

The first edition of ELIS, under the editorship principally of Allen Kent and Harold Lancour, was published between 1968 and 1982. The 33 volumes of the first edition were published in alphabetical sequence during those years. After the "Z" volume appeared in 1982, a number of supplements were published at roughly the rate of two per year, up to and including volume 73, which appeared in 2003. Miriam Drake was appointed editor for the second edition, which appeared in 2003, both online and in paper. The second edition came out at one time in four large-format volumes, with a supplement in 2005 [3]. Kent and Lancour covered a wide range of librarianship, information science, and some computer science topics. Drake, an academic library director, emphasized academic libraries, and the ELIS-2 volumes contained many profiles of major academic libraries and professional library associations.

The third edition, under the editorship of Marcia Bates and Mary Niles Maack, reflected a growing convergence among the several disciplines that concern themselves with information and the cultural record. As information science educators and noted researchers in the field, their focus was on growing the encyclopedia in the theoretical fields of information sciences as well as drawing together the associated information and cultural disciplines such as archival sciences and museum studies within the overall field of LIS.

For this edition, we have focused on developing the encyclopedia to reflect the changing nature of information production and consumption through online and digital forms. We have also endeavored to fill in gaps in the description of important people, places, and theories in the information sciences, and further enhanced the description of important concepts related to the provision of research information and the field's major institutions.

We continue to see the audience for the encyclopedia just as previous editors have: as principally consisting of 1) the educated lay person interested in one or more of its topics, 2) students learning about a topic, and 3) professionals and researchers in the several fields who want to learn about something new, or to be refreshed on a familiar topic.

We honored the previous editors by reengaging their superb Editorial Advisory Board with significant new additions of experts known to the current editors. (See listing in the front matter.) These leaders and experts from as many disciplines as are in the encyclopedia provided excellent guidance and feedback for the editors as they began the process of new topic generation, evaluation of previous entries, and offering to author or review numerous entries throughout the process of publication.

All new and revised entries were reviewed by one or more outside expert reviewer as well as one or more of the editors. Referees provided invaluable feedback to authors, including noting errors or omissions as well as making suggestions on additional aspects of the topic to cover. While we made every reasonable attempt through this process to check the accuracy of every entry and every fact, undoubtedly readers will find some topics explained more thoroughly or accurately than others. Indeed, due to the time frame from the beginning of the generation of the fourth edition and the time of publication, readers will reasonably note that some topics have been quickly superseded due to this passage of time, so the

date of acceptance of the entry will be noted on each entry since several years may have passed since the writing of the entry and the publication of this edition.

Acknowledgments

This edition of the encyclopedia was possible only through the countless hours that the editors, John McDonald and Michael Levine-Clark, spent reviewing the previous encyclopedia entries, outlining the topics that were missing or that were newly emerging in the field, and identifying appropriate expert authors to write those new entries. In addition, the editors devoted extensive time to corresponding with previous authors encouraging them to revise their entries, and finding replacement authors for important entries that needed revisions but whose original authors were unavailable. Both editors wish to acknowledge the expertise of each other and their knowledge of our field, their extensive network of contacts, and their ability to work closely together to ensure the success of this encyclopedia. Neither of them could have completed this project alone.

They acknowledge and thank the Taylor & Francis Group editors, Claire Miller and Rich O'Hanley, as well as Susan Lee, who passed away at the early stages of the preparation of this edition, and more recently, Alexandra Torres, who supported and kept the editors and authors on track over the course of the years of work on this edition of the encyclopedia.

The editors thank the authors who wrote and revised entries, and the huge number of reviewers who refereed the entries. Without their dedication, expertise, and willingness to share their knowledge with others, there would be no encyclopedia. They also wish to thank the Editorial Advisory Board for their advice, suggestions of topics and authors, their hours spent writing or reviewing for the final edition. They also wish to thank the previous editors, Marcia Bates and Mary Niles Maack, whose organization and structure for ELIS-3 provided an excellent blueprint for ELIS-4.

Library Science in the United States: Early History

John V. Richardson, Jr.

Department of Information Studies, University of California, Los Angeles, Los Angeles, California, U.S.A.

Abstract

The narrow purpose of this entry is threefold: 1) to identify the key events and players in the origin and early development of the discipline of library science in the United States (and perhaps North America more generally, but certainly not Europe, much less India, other than to mention its origins in Germany); 2) to describe the intellectual foundations and history for the discipline of library science as developed at the University of Chicago's GLS; and 3) to briefly identify the knowledge and skills as well as values associated with this emergent field. Strictly speaking, therefore, it is not a discourse on computer science, informatics, information science, information studies, or for that matter, the history of librarianship nor books and libraries; neither is it a history of literary endeavors, printing, writing, or scholarly communication per se, but rather it is an introductory orientation to a highly specialized field of knowledge.

INTRODUCTION

Library science has its origins in early nineteenth century Germany, notably as *bibliothekswissenschaft*. Despite the fact that thousands of Americans studied in Germany before the World War I, Schrettinger^[1] and Schmidt^[2] are unknown or forgotten today; elsewhere, someone might answer the provocative question: “whereas Germany hugely influenced US universities, almost all disciplines, and university research, what was the German influence on library science in the United States?”^[3] The narrow purpose of this entry is threefold: 1) to identify the key events and players in the origin and early development of the discipline of library science in the United States (and perhaps North America more generally, but certainly not Europe, much less India, other than to mention its origins in Germany); 2) to describe the intellectual foundations and history for the discipline of library science as developed at the University of Chicago's GLS; and 3) to briefly identify the knowledge and skills as well as values associated with this emergent field. For a detailed chronology of significant events in education for librarianship rather than a discussion of three major thematic elements, see Appendix A.

In other words, the scope of this entry covers only the field as it developed in the United States: as the profession of library economy first, with a strong emphasis on efficiency in library techniques due to the influence of Melvil Dewey at the New York State Library in Albany. In the later nineteenth century and into the first quarter of the twentieth century, the field also adopted certain overtones of the Social Gospel movement as librarians viewed themselves as “apostles of culture”^[4] and the field embraced the cult of efficient and scientific management under the influence of F. W. Taylor and Charles McCarthy.^[5]

Importantly, though, the outdated nineteenth century natural history worldview based upon Enlightenment ideas: “Let's see what's there and we'll record it,” did not survive as the principal means of knowing, but that heritage or genealogy is still occasionally present and or at least lamented in some quarters.

In what I wish to call its protohistory, library science then, evolved out of a library apprenticeship or a silent reading on one's own like the early study of law. Indeed, many practitioners adopted a kind of intuitive approach until Melvil Dewey's school at Columbia College appeared on the scene in the last decades of the nineteenth century Wiegand^[6]—as a side note, most early programs of librarianship were affiliated with academic or public libraries and provided their students with firsthand, practical experience with, and knowledge of, these library collections; given this American pragmatism (i.e., the practical problem solving orientation of their teachers and their students), it is not surprising that these programs produced little, if any, research per se, unless the compilation of descriptive, annotated bibliographies counts as research.

Certainly, this early kind of “library science,” with its emphasis on applied workability and scientific knowledge, was based on a notion of American exceptionalism, which is “the idea that America occupies an exceptional place in history, based on her republican government and wide economic opportunity” Ross.^[7] In other words, library science then was one of those rather American social sciences which began coalescing in the late nineteenth and early twentieth centuries as part of the move to professionalize vocational activities and as such would include dairy science, management science, military science, mortuary science, political science, and even creation science/intelligent design today. In the early twenty-

first century, the term is still used interchangeably with librarianship, library and information science, and perhaps even information science, but there are important semantic differences. So, this entry will define what library science meant to a group of practitioners and professors after the turn of the twentieth century.

In Chicago during the late 1920s, a group of local librarians rallied for something more substantive than the existing institutionally based library programs after the appearance of the highly influential C. C. Williamson Report of 1923, which argued for dividing library clerical tasks from professional ones. Education for the latter, Williamson argued, should take place in universities where instructors would hold higher academic degrees and have had prior teaching experience. Hence, a so-called advanced or “Graduate Library School” was established at the University of Chicago to meet the Association of American Universities’ standards, and which imbued a more exact meaning to this previous hollow phrase.

By “library science,” they now meant the scientific study of the intersection of books and people.^[8] In other words, attention shifted away from a library economy and its focus on institutional structures and processes to the user of the library—as an aside, American glossaries may have dropped the phrase “library economy” in the late 1920s, but *bibliothéconomie* remained in French with its equivalents in other Romance languages.

Notably, the first Graduate Library School faculty at Chicago, under the leadership of George Works, embraced the twin concepts of original, independent research and promoted the publication of the results of their investigations (notably, diffusion via books in the “Studies in Library Science” series and in refereed articles in journals such as the *Library Quarterly*). Carleton B. Joeckel’s *The Government of the American Public Library* of 1935, part of this SLS series, is particularly noteworthy for drawing upon political science for its theoretical orientation; according to some international reviewers, this work “at once placed American library research on a higher plane. . . [and, as a result, it] received the James Terry White Award in 1938 for ‘notable published writing.’”^[8]

In January 1931, the school published the first issue of *The Library Quarterly*, a double blind refereed “journal of investigation and discussion in the field of library science,” edited by William M. Randall, who was assisted by a distinguished international advisory board. Rather than serve as a news magazine like the extant publications, the *LQ* was intended to strengthen the scientific underpinnings of the profession by stressing the social significance of the library rather than its internal operations and by publishing “exploratory rather than merely descriptive articles.”^[8] To understand this new conception of research, one need only read the lead article: C. C. Williamson’s “The Place of Research in Library Service.”^[9]

The journal was edited at the University of Chicago until Stephen Harter (PhD, Chicago) at Indiana University took over in October 1990; John Richardson at UCLA served as editor from 1994 to 2003; next, Wayne Wiegand and John Bertot of Florida State University served as coeditors from 2003 to 2008; and from October 2008 to the present, John Carlo Bertot and Paul T. Jaeger serve as coeditors.

LQ, though still respected, has long since lost its absolute preeminence in the field with the rise of such scholarly journals as *College and Research Libraries* (1939), *Journal of Documentation* (1945), and the *Journal of the American Society for Information Science and Technology* (formerly *American Documentation*, 1950). Nonetheless, to understand more fully the role and contribution of the journal over time, one should consult Arthur P. Young’s 2006 *LQ* article which identifies *LQ*’s leading contributors (i.e., Howard Winger and Lawrence Thompson), the most cited authors (i.e., Don Swanson and Abe Bookstein), and the most cited articles (see his top thirty list presented as table five) between 1956 and 2004.^[10]

KNOWLEDGE AND SKILLS (OBJECTS OF STUDY)

The essential skill provided by librarians, curators, archivists, and others is the provision of information, especially via organized collections of reading materials. Hence, how one might best provide this information is the main problem. Concomitantly, the dual mission of this field is to ensure the preservation of such materials (thus, the leading intellectual question is: what should you save, if you can’t save everything?) and then delivering access to these materials (hence, the main intellectual question is: how to best do so, given the variety of formats and technologies?). Therefore, these are the two primary theoretical questions which one must answer.

Historically, these skills demanded a knowledge set related to bibliographical access control: 1) bibliographical description (aka rules for cataloging) and 2) bibliographical arrangement (aka systems for classification) as well as infrastructural concerns (such as the proper administration and management of complex institutions); furthermore, the desire for more scholarly librarians, ones capable of creating new knowledge about the interaction of books and people, required the use of statistical techniques and interpretive models (drawn from history or cultural anthropology, in particular).

Once highly valued by bibliographers and librarians in the nineteenth century, the compilation of bibliographies (even rigorous or systematic annotated ones) came to be viewed as merely the parent of real research, as merely the first step prior to solving a research problem. At Chicago, Waples’ graduate courses in research methods drew upon interdisciplinary sources including history (i.e., of books,

libraries, and printing), psychology (i.e., of the patron, reader, or user's information seeking behavior), and sociology (i.e., a rigorous and systematic community analysis or needs profiling is necessary prior to building diverse, useful or viable collections of materials for library users). Now the classic methods textbook, Waples' 1939 *Investigating Library Problems*, with its emphasis upon the validity and reliability of evidence, served several generations of graduate students. In essence, this text and his course inspired the confidence of young researchers to conduct research independently; to communicate and thereby share their findings; pursue adaptive, critical, and reflective thinking; undertake logical problem solving; and respect for the diversity of opinions. Library science would not develop its own unique methodologies until the introduction of a kind of statistical bibliography, also known as bibliometrics or citation counting, until the 1950s. And even so, that is still debated by some writers who attribute its true origins to psychologists in the early 1900s; clearly, though. E. Wyndham Hulme coined the phrase "statistical bibliography" in 1922–1923 and such work appeared in the *Bulletin of the International Institute of Bibliography* as early as 1911. This point is important to those who hold that to be considered a discipline, library science must have its own unique methods.

To achieve what Harvard University had done for law and what Johns Hopkins University had done for medicine, then a true "library science" would have to be offered at the graduate level. There would be no place for the holder of a high school degree or some mere technical/trade school curricular orientated worker (which would produce a technician who knew how to do something, rather than a professional who also knew why do something in the first place by investigating the philosophical underpinnings of such actions). In other words, what some graduate educators sought was a diagnostician of professional tasks, not a mere mechanic suited to routine library clerical tasks.

So, in the mid-1920s onward, the American Library Association's Board of Education for Librarianship, influenced by the Williamson Report, mandated a set of admissions requirements to accredited programs of librarianship. One of the explicitly, stated entrance requirements now included a college degree (commonly held in English literature, American history, or a western European foreign language—a social science major, if present, was rather more common than the natural or physical science backgrounds of the small remainder of applicants). This stance is well articulated in Pierce Butler's *Introduction to Library Science* and Douglas Waples' *Investigating Library Problems* which taken together, established an epistemological stance toward our activities—with a good science and good practice, things should take care of themselves.

As expressed in Butler's *Introduction*, the scope of library science covered the sociological problem (e.g., the role of books in society), the psychological problem (e.g.,

the psychological motive for reading among individuals or the effect of reading on the reader), and the historical problem (e.g., the literary history of scholarship). By the 1990s, increased interest was paid to the distinction between tacit and implicit knowledge as well as the difference between declarative (i.e., know what) and procedural (i.e., know how) knowledge.

The relationship between the empirical knowledge as generated by GLS faculty and its doctoral graduate students and the practical knowledge which could be applied by practitioners is most clearly demonstrated in their Annual Library Institutes beginning in 1936. Topics are those of pragmatic interest to practitioners and cover such topics as book selection (1939), acquisition and cataloging (1940), and reference service (1943). For more thematic issues, one can consult the list of these annual institutes through 1951 in Appendix B.

TYPES OF LIBRARIES (INSTITUTIONAL INFRASTRUCTURES)

Early education for librarianship in the late nineteenth century possessed a strong applied or pragmatic work orientation due to its being situated within the institutional framework of a local public or academic library. At the University of Chicago, the new appointed faculty members, except for Pierce Butler who came from the Newberry Library and Harriet E. Howe, a peace offering to American Library Association, were not library practitioners. Rather they held degrees in various academic disciplines including education (Howe and Works), educational psychology (Waples), ecclesiastical history (Butler), linguistics (Randall), and philological studies (Wilson). Nonetheless, they continued to teach about types of libraries: college (Randall and Wilson); public (Wilson and Joeckel), and school (Waples).

GLS graduates also played an important role in shaping American education for librarianship, as they became deans and directors there and in the other leading programs across the nation: Bernard R. Berelson at the University of Chicago; J. Periam Danton at UC, Berkeley; Raynard Swank at UC, Berkeley; Jesse Shera at Case Western Reserve University; and Ralph Shaw of Rutgers University.

Later in the 1950s, library science programs, such as those at the University of Michigan and the University of Illinois, downstate at Urbana-Champaign (and populated with GLS alumni including Thelma Eaton, Herbert Goldhor, Rose Phelps, and Mary A. Lohrer), would shift their curricular emphasis from types of libraries to library services (which would include functional activities such as abstracting and indexing, acquisitions, cataloging and classification, collection development, outreach to underserved populations, programming, reader's advisory, and reference work). Most recently, the curriculum has shifted yet again, this time to the role of information in society.

VALUES

As articulated in Butler's *Introduction*,

a scientist always selects the field of his observation. In his eyes not all facts are of equal importance. He does not devote his days to the endless multiplication of his sensual perceptions in the hope that perhaps something new will come to his notice. . . . His professional ambition would prefer that his name should be used to designate a new theory than any number of previously unrecorded species. His concern is, first of all, functional significance. He has also a perverse curiosity about the unexplained.^[11]

In the narrowest institutional terms, Butler's classic work helped the library profession understand the mission of an Advanced, Graduate Library School, serving as an aspirational document of what the GLS's goals and objectives were. Concomitantly, Waples research methods textbook is a companion piece on how to undertaking reliable and valid social science research. Waples recommends that a would-be researcher focus on stating a research problem, examine the validity of evidence, draw an adequate sample to ensure reliability, and pay attention to sources of evidence.^[12] Basically, Waples' text offered readers a structured way of thinking about the field of library science.

Many thoughtful writers today suggest that library science has been shaped by an instrumental, positivistic social science during its Chicago years. Despite later claims of being value-free or neutral (which necessarily arise when talking about the need to build balanced collections of library materials, at least if one wishes to be respectful of the diversity of different points of view and provide these different perspectives on socially controversial matters), a complex constellation of values exists (namely, the perceived need for preservation and the concomitant access services for library users and their right to know as well as equity of access; literacy is foundational for the preceding, but not numeracy per se; rights to privacy and free speech, contextualized inside a democratic society, often associated with a liberal or advanced capitalism). In short, many of us believe that it is better to be informed than ignorant because access to information reduces social inequities.

One of the best examples is the *Public Library Inquiry* of 1949^[13] which posits the American public library as a democratic institution, responsible for social equalization. Many librarians would agree with the following belief statement (aka articles of the Library Faith): that the act of silent reading of nonfiction as well as fiction is desirable; libraries should avoid censorship and support intellectual freedom by offering a balanced or unbiased collection of authoritative or at least credible materials, be public, free of direct use fees; furthermore, these cultural nonprofits are good or desirable while large, for-

profit companies are bad (if not, lazy or even evil)—or simply put, many librarians would respect intellectual property rights (but support the notion of fair use within the bundle of copyrights), yet oppose the increasing “commodification” of information, a term which dates to the 1970s.

Controversy exists about the proper role of pure versus applied problem solving; see, for example, Works' cooperative research agenda proposal.^[14] Likewise, Butler initially argued for a strongly interdisciplinary approach, drawing upon the three academic disciplines of history, sociology and psychology.^[11]

Like other research university disciplines, though, original, independent research in the form of a dissertation or thesis is still expected, if not valued, as is the desirableness of seminars, or scholars' workshops, over large classroom lectures (although popular, asynchronous online courses as offered by some LIS programs may be cited as a counterexample). Despite some antagonism at the outset and continuing today because one's research agenda may be set by the agency or philanthropic organization, nonetheless, the role of extramural funding is significant in research universities (note that the Chicago GLS got its start from the Carnegie Corporation with a one million dollar grant); and in situ, may explain, at least partially, the rise of the I-school movement.^[15] Perhaps someone else should write on its origins in the research university because it is out of scope for this entry on library science. Certainly, a recent tension has emerged between two models—the scholarly professor and the research professor. Early on, the former model, aka the “lone wolf” model (i.e., an independent scholar working alone in the library/archives writing a monographic volume, published by a leading university press) dominated the discipline of library science. Later, the field witnessed a shift to the other model, which may have begun with the introduction of information science into the more traditional library service programs in the 1960s and 1970s. At this time, another group of individuals, largely from mathematics (such as Robert M. Hayes) and the physical sciences (such as Don R. Swanson) were hired into library science programs, and with them came an interest in extramural funding, a strong sense of the need for collaboration, a major role for microfilm and computer technology including punch cards, and a rather ahistorical approach to the profession. They called themselves information scientists (note that one rarely encounters a library scientist).

Perhaps the rise of superior Soviet technology in the late 1950s (notably, the successful launch of Sputnik, the first man into space, as well as the first ICBM), caused the U.S. Congress to pass the National Defense Education Act of 1958 and in turn caused the federal government to spend even more on competitive research grants in higher education, benefiting the information science types in library programs; certainly, there is also evidence of the Cold War, the National Science Foundation, and Big

Science before these events, however, which could also explain the large-scale U.S. federal grant making.

Doug Raber's *The Problem of Information: An Introduction to Information Science*^[16] brings a strongly humanistic orientation to the discussion of representation of information, relevance, and the value of semiotics. Likewise, the library science field has embraced the inclusion of archival sciences in the 1980s and informatics (not to be confused with computer science) in the 1990s. Since computer science focuses on algorithmic solutions to improving the speed and space domain of computation, library science stresses the more humanistic interests (or, the people aspects) in the intersection of science, technology and society.

Philosophically speaking, library science researchers believe that things can be measured; on the other hand, that may well beg the more fundamental question of what cannot be measured. The differing methodological orientations have caused the discipline to divide into two camps at times: the “quals” versus the “quants.” The desire for universalistic abstraction (rather than mere descriptive chronologies of the local library^[17] can be cited as a model in this regard) has been problematic even in the historically oriented side of the house. In any event, however, the fundamental unity in library science lies in the rigorous, spirit of inquiry as articulated at Chicago. The following example from the 1930s of Leon Carnovsky's spirit of inquiry is illustrative: while walking on the Midway with Wilson, Carnovsky challenged on the vendors hawking an expensive cigarette lighter called the everlasting match. “See here, Mister, there is something wrong with that assumption. If one match is everlasting, why get three?”^[8] By the mid-to-late 1930s, Butler had begun to recognize a possibly fatal flaw in the GLS approach mainly that of scientism, the overly narrow focus on only the quantifiable aspects of the field. He wrote on this topic in 1941 and again in 1951; by then, he had become absolutely convinced that

there was no room for humanistic concerns in this new world view. Although [Butler] believed that the GLS's ‘highest intellectual achievement was the establishment of library science on a sound basis in a few areas,’ the humanistic side of librarianship had been displaced by practitioners of a narrow objectivity. Librarianship had, in fact, been replaced by a pseudo-science in Butler's opinion. Ideas were supplanted by facts, or even worse, by mere data. The field risked becoming truly anti-intellectual, lost in ‘the simplicity of its pragmatism.’^[11]

CONCLUSIONS

“Within the recent past, librarianship had placed a heavy emphasis upon tradition and custom as a way of doing things.”^[11] Yet, many of these earlier works by bibliographers and librarians were viewed as “too practical and

obvious to merit” attention in a research-oriented environment like the American university,^[8] nonetheless the introduction of a library economy, similar to home economics or domestic science, by Melvil Dewey and other events in 1876 are two of the important watershed events in the history of library science. In addition, the establishment of the Graduate Library School at Chicago was a pivot watershed event in the establishment of a real library science in the United States and the subsequent professionalization of education for librarianship. At Chicago, early writers

described library science ‘as the science of the care and use of books both for the control of knowledge already in existence and for the discovery of new knowledge through researches in books themselves or with books in connection with other sources of information’...Waples, as acting dean, in 1931 defined research in library science as ‘extending the existing body of knowledge concerning the values and practices of libraries in their many aspects, and including the development of methods of investigation whereby significant data are obtained, tested, and applied.’^[8]

The affiliation of a program with a research oriented university like the University of Chicago imparted a more theoretical dimension to librarianship; the key players and staunch supporters of this movement include the early GLS faculty such as George Works, William M. Randall, Douglas Waples, and Pierce Butler (at least until near the end of his life, when he began to have grave doubts). GLS alumni, such as Herbert Goldhor, also played a role in the adoption of social science research methodologies.^[19] In short, I have argued that the American notion of library science is largely a creation of the GLS at Chicago. I have not intentionally ignored other library science programs, or Shera's foundation of a new kind of school at Case Western Reserve University, where the introduction of graduate studies in what became known as documentation led eventually to the idea of an information science. Simply, these ideas are out of scope for the purposes of this entry.

More recently, writers, notably John Budd,^[20] have remained optimistic about the role of hermeneutical phenomenology (“which combines a kind of realism with understanding of the dynamics of human action and perception”) which brings a sense of intersubjectivity to combat the repressive aspects of scientism in library science.

Whether ‘books’ was too narrowly understood [at Chicago] to mean the codex rather than the ‘generic book,’ thus ignoring scientific report literature and giving rise to the new intellectual discipline of information science, is outside the scope of this article (although there appears to be evidence for this hypothesis).^[8]

The introduction of library automation in the 1960s buoyed the field.

Likewise, information studies (a recently emergent dimension) seems to offer the softer intersection of information resources, information technology processes, and user needs. Yet, the recent discussions of a humanistic I-school seem strongly reminiscent of this library science as understood by the University of Chicago and their being situated in large research universities will influence much of their research agenda. Of course, only time will tell if this “school of thought” holds up. Certainly, the intellectual history of specific programs is yet to be written; a notable one would look at the aggressive expansionism at Berkeley by Danton followed by the underestimated intelligence and strategic shrewdness of Ray Swank.^[3]

More than ten years ago, a fellow encyclopedist observed that

although research in library science has come a long way, it still has not reached the maturity of other disciplines. . . [and struggles with] an academically imposed inferiority complex and linguistic dilemmas on the meaning of research for an applied and service field^[18]

and it is hard to disagree with his assertions. In fact, the continuing relevance of a “library science” to an information society remains an open question and Blaise Cronin has provocatively asserted that “there is, and can be no such thing as ‘library science.’”^[21]

ACKNOWLEDGMENTS

This work benefited from the comments of two anonymous reviewers as well as one of the editors, Mary Niles Maack. In addition, I greatly appreciate the fact that Larry Olszewski; Boyd Rayward; John Budd; and Michael Buckland answered my questions, contributed ideas as well as took the time to read and comment on an earlier draft of this entry.

APPENDICES

A. CHRONOLOGY OF SIGNIFICANT EVENTS IN EDUCATION FOR LIBRARIANSHIP

1870s

1879, May: Melvil Dewey suggests a “librarians’ college” which would be attached to a normal school with a considerable library.

1880s

1883, August: Dewey proposes school of library economy at Columbia College.

1886, July: Dewey announces his school will open in October at Columbia College.

1887, 5 January: First class in library economy offered at Columbia College.

1888: Dewey argues for correspondence courses in special library and small library services (hence, first distance education program).

1889: First class graduates from Columbia College; school transferred to New York State Library in Albany on 1 April; August: Annie C. Moore argues for special training of children’s librarians.

1890s

1890, June: Pratt Institute, Brooklyn offers its first class in cataloging followed by library economy courses.

1891: Drexel Institute started offering library economy courses.

1893, September: Armour Institute Library Class first term under direction of Katharine L. Sharp in Chicago.

1895: First separate course in government publications offered by F. Jackson at Armour Institute.

1897: Transfer of the Armour Institute to University of Illinois, Urbana.

1898, August: New York State Library’s Library School offers specialized instruction for law, medical, education, and engineering librarians.

1900s

1901: Carnegie Library of Pittsburgh establishes Training School for Children’s Librarians; Western Reserve proposes library school.

1902, August: Four year library training class announced by Simmons College, Boston.

1903: New York Public Library establishes training class; Western Reserve receives endowment for library school from Andrew Carnegie; American Library Association’s Committee on Library Training recommends correspondence work offerings

1905: Melvil Dewey suggests that only three schools are needed: one at Albany, one in Midwest, and another at the University of California; University of Washington offers their first annual summer school for library training; Syracuse University establishes Library School; Andrew Carnegie tells library school class serve that “nowadays professionally trained people are needed.”

1906, June 16: First MLS (*honoris causa*) degree conferred at SLS, Albany.

1907: Library School faculty from various schools met for the first time at Asheville, NC, American Library Association Convention (ALA).

1910s

1911: Roundtable of Library School Instructors formed in ALA.

1915: Association of American Library Schools founded.

1919: University of Texas establishes School of Library Science; September: Andrew Keogh (Yale) argues that academic librarians need advanced library training; Charles C. Williamson publishes ground-breaking *Some Present-Day Aspects of Library Training*.

1920s

1922: Charles C. Williamson transmits "Training for Library Work" to Carnegie Corporation.

1923: Williamson's *Training for Library Service* appears in print; ALA's Executive Board appoints Temporary Library Training Board.

1924: ALA establishes Board of Education for Librarianship with Carnegie Corporation assistance.

1925: Tse-Chien Tai's "Professional Education for Librarianship," PhD dissertation, University of Iowa.

1926: Carnegie Corporation funds the first Graduate Library School at the University of Chicago, which offers first summer institute for Library Science; the Albany Library School and NYPL Library School merge and transferred to Columbia University.

1927: GLS at Chicago appoints George Works first dean; ALA launches Curriculum Study under the direction of W.W. Charters.

1928, Fall: GLS at Chicago admits students working toward PhD degree.

1929, April 12: George Works resigns as Dean of Chicago GLS.

1930s

1930: First PhD in library science: Eleanor Upton's "A Guide to 17th Century Materials in the Reports of the Historical Manuscripts Commission of Great Britain to Date" at University of Chicago.

1932: Louis Round Wilson appointed dean of Chicago GLS.

1933: Publication of Pierce Butler's *An Introduction to Library Science*; ALA Board of Education for Librarianship establishes qualitative Minimum Requirements for library schools.

1936: Two major studies appear: Ralph Munn's *Conditions and Trends in Education for Librarianship* and Ernest J. Reece's *The Curriculum in Library Schools*.

1940s

1942: Louis Round Wilson retires as Dean of Chicago GLS.

1943: Publication of Metcalf, Osborn, and Russell's *Program of Instruction in Library Schools*.

1946: Publication of Joseph L. Wheeler's *Progress and Problems in Education for Librarianship* and J. Periam

Danton's *Education for Librarianship*; ALA Council establishes Library Education Division.

1947: Harriet E. Howe moves the University of Denver program from a BLS to a one year MLS degree; Florida State University sends library science educators throughout the state in automobiles.

1948, 1 August: ALA's BEL suspends accreditation of library schools; University of Illinois and University of Michigan offer PhD program in library science.

1949: Twenty-seven of the thirty-two accredited schools adopt the new MLS degree (or in process of doing so); publication of Bernard Berelson's *Education for Librarianship*.

1950s

1951, July: ALA adopts new *Standards of Accreditation* making MLS entry level degree.

1952: Columbia University offers Doctor of Library Science.

1956: Western Reserve University offers PhD degree.

1959: Robert M. Hayes at UCLA teaches first course ever on information storage and retrieval; University of California at Berkeley offers PhD degree; ALA Council adopts Standards and Guidelines for Undergraduate Programs in Library Science.

1960s

1960: Rutgers University offers PhD degree.

1961: *Journal of Education for Librarianship* established; publication of Sarah Vann's *Education for Librarianship Before 1923*.

1962: ALA appoints Commission on a National Plan for Library Education.

1965: U.S. Office of Education establishes position of Library Education Specialist; NDEA Institute funds made available for school librarianship; HEA, Title II Part B provides funds for institutes and fellowships.

1966: ALA establishes Office for Library Education; UCLA establishes two year MSIS degree program.

1968: ALA's COA establishes subcommittees on undergraduate and graduate standards for accreditation.

1970s

1970: ALA Council adopts Library Education and Manpower policy (so-called Asheim statement); Publication of Hal Borko and Robert Hayes' *Education for Information Science* and C. Edward Carroll's *The Professionalization of Education for Librarianship*.

1972: ALA's COA establishes revised *Standards for Accreditation*; Jesse Shera's *Foundations of Education for Librarianship*; UCLA establishes two-year MLS degree incorporating MSIS degree.

1974, School of Information Studies, Syracuse University, established.

1975: Publication of Charles Churchwell's *The Shaping of American Library Education*.

1980s

1980: Publication of *The Conant Report: A Study of the Education of Librarians*.

1982: Publication of Richardson's *The Spirit of Inquiry, the GLS at Chicago, 1921–1951*.

1983: AALS changes name to Association for Library and Information Science Education.

1986: ALISE and ALA celebrates 100 years of education for librarianship in New York City.

1988: ALA executive Board endorses joining the National Council on Accreditation of Teacher Education as a specialty organization for the purpose of accrediting first professional degrees for school library media specialists.

1989: Library and Information Science Distance Education Consortium formed; Graduate Library School, University of Chicago, closes.

1990s

1990: ALA Executive Board appoints a Special Committee on Library Closings.

1992: *Standards for Accreditation*, 1992, adopted by the Council of the American Library Association; ALA president-elect, Marilyn Miller, announces Project Century 21, a major research and study project for the development of library and information science education.

1993: Columbia University, echoing its 1889 action, once again closes its School of Library Service.

1996, School of Information, University of Michigan, established.

2000s

2001, iSchool, University of Michigan, established.

2002, School of Information, University of Texas at Austin, established.

2005, First conference of i-School Community at Pennsylvania State University.

Library Technical Services

Doris S. Helfer
Helen Heinrich

*Collection Access and Management Services, California State University–Northridge,
Northridge, California, U.S.A.*

Abstract

The entry describes the key functions of library's technical services (TS) components. It traces the history and the major developments that affected the evolution of TS. The entry highlights the progression of cataloging-related standards and the way technology impacts the current workflow and expectations for staff expertise.

INTRODUCTION

Technical services (TS) usually refers to the combination of the acquisitions, cataloging, and collections management functions of a library into one unit or department. Acquisitions are used to refer to the functional department responsible for all aspects of obtaining materials libraries acquire for their collections. Cataloging is used to refer to the functional department responsible for all aspects of describing, assigning subject headings, and classifying to ensure that users can find the materials they need. Cataloging also encompasses authority control or the process of authorizing and verifying author/title/subject headings contained in bibliographic records and ascertaining their usage in the established form. Collections management entails physical processing and preservation of the materials libraries have obtained and cataloged.

While “the technical services are as old as libraries, the technical services unit is a development of the past forty years”^[1] and that places the development of Technical Services Departments in the 1930s. Donald Coney presented the first published examination of the unit organization of technical processes in 1938.^[2] The isolation of TS in a separate division is a function of size more than a change in attitude toward the services—first a separate unit is established to handle cataloging, then one for acquisitions, later serials, and, finally, all of them together as a separate division with its specialist head.^[1]

ACQUISITIONS

As libraries grew in size, so did the need to ensure that the materials could be acquired and then found by the libraries' patrons. Historically, the acquisitions decisions were done by the Head Librarian and the actual ordering done by the clerical staff, but with the ever-increasing size of the collections and budgets, this became impractical and a

specialized department in libraries was established. The unit was often originally called the order department, but that name was gradually replaced by acquisitions to reflect the broadening duties that could often include gifts, exchanges, mail services for the entire library, bindery, serials check-in and control, government documents, budget and financial control, and purchasing of all types of equipment for the library. With the advent of electronic resources, many purchase decisions are often negotiated through purchasing consortiums formed to help individual libraries obtain the best possible prices for their member libraries.

The organization of acquisitions unit varies greatly depending on the size and scope and mission of the library. In special libraries and very small specialized schools or colleges, the acquisitions unit typically collects in great depth only in the area of specialization of the organization, school, college, or business the library supports.^[3] Special libraries generally do not have sufficient financial or space resources to collect or retain vast collections of materials but instead buy or borrow materials as needed to support the research needs of the organization at that moment, which may frequently change and evolve rapidly and therefore have smaller acquisitions units. As most purchasing/accounting organizations, they also adhere to standard accounting practices developed by the American Institute for Certified Public Accountants (AICPA), which insist that ordering, receiving, and payment functions are done by separate individuals in the organization to help avoid fraud, theft, or embezzlement.

In academic libraries, acquisitions units are often organized by the material types to be ordered, usually breaking into either a monographs units, a serials or continuations unit, and/or periodicals or journals unit and further subdivided by the country or region of the world where the materials being requested originate from and can be obtained if the library collects in a large number of languages. In addition to the Head Librarian who

originally made collection decisions, faculty members were consulted regularly to give input on purchase requests of materials in their specific subject areas of expertise. With the growth in the size of collections, it usually now falls to a team of subject specialist bibliographers to do collection development. The bibliographers determine the scope and nature of what the library collects. Bibliographers then make specific recommendations as new books get published or new subject disciplines added to the area of studies of the academic institution to ensure necessary books and materials are added retrospectively if necessary to support the new curriculum and the research mission of the university. Depending on the library, collection development may not always fall within the TS department. Collection development is sometimes a stand-alone department or even a part of the reference department since there is a strong component of outreach to faculty involved in making collection development decisions. Once materials have been selected by the subject bibliographers, generally acquisitions units order materials also ensuring that they adhere to standard accounting practices of the AICPA. In some organizations, purchasing functions may be part of the larger organizations procurement or accounting departments but with the increased specialization required by the growing electronic nature of library materials; this is not something most procurement or accounting departments are desirous or are capable of handling and the library purchasing functions are generally a part of the library whether they are an academic, public, or special library. Unlike other library departments, acquisitions are often staffed by paraprofessionals with accounting experience. The need for the formerly ubiquitous position of acquisitions librarian is rapidly deteriorating, suggesting the deprofessionalization of acquisitions.^[4] With the proliferation of online purchasing tools and software, acquisitions personnel are also expected to be computer savvy and familiar with the software purchasing systems used by the library.

Public libraries purchase materials of general and widespread interest, information, and enlightenment to all people in the communities they serve, and the materials strive to represent a broad range of views to ensure that the communities they serve have access to information to help them know more about themselves and their world; supplement formal study or encourage informal education and reading; improve job-related skills; stimulate participation and interest in world and community affairs; and provide access to variety of opinions. They provide access to materials of varying reading levels and languages depending on the community's needs to generally support educational, civic, and cultural activities.^[5]

Public libraries TS departments are usually centralized and offer standardized materials throughout their system and depending on the library system may offer local branch libraries the ability to buy specialized materials in

various languages to better serve local populations reading interests.

While very small libraries might be able to handle individual ordering with vendors and publishers, most academic and public libraries deal with vendors who provide book approval plans, such as Baker and Taylor, YBP, among others, and subscription vendors such as EBSCO, WT Cox, and Prenax in addition to direct ordering for titles not handled by these vendors. Subscription agents handle the renewals and any missing issues claims for the thousands of journals and standing orders for the library to ensure the library receives all periodical issues for which it has paid. Libraries use subscription vendors to help them keep track and handle subscription renewals and increasingly complex issues regarding handling electronic journals.

Libraries work with approval plan vendors by setting up a profile indicating the types and categories of materials the library wishes to obtain, and as materials are published meeting those criteria, the approval vendor automatically ships those materials to the library. Those books are reviewed by the subject specialist bibliographers for approval and can be returned to the vendor if the bibliographer does not feel the book is of sufficient quality or subject interest for the library. If libraries cannot afford to collect everything in certain categories, they can sign up with approval plan vendors to have their bibliographers/subject specialist librarians regularly look at the bibliographic information about newly published books either on what were called approval slips or increasingly in an online bibliographic system where they can mark and select only those books the library would like to buy from them, and the approval vendor then sends only the selected books.

As with the other areas of the libraries, acquisitions procedures and processes started changing in the late 1960s and 1970s with the purchase of automated and integrated library systems and the acquisitions processes streamlined and improved by the adoption of automation and standards, which allowed libraries to send orders using electronic data interchange (EDI) and to be billed and to pay vendors electronically in return. While the trend toward computerization of acquisitions records has been strong since the 1970s, many acquisitions procedures were not done online until the advent of the web-based services and electronically available journals and books. In addition, the growth and development of new TS-related products and services from vendors meant the increased need for cataloging and acquisitions to work together in order to make accurate bibliographic information appear on orders transmitted to vendors and thus ensure libraries gets shipped the correct item. The inter-reliant workflow between acquisitions and cataloging signified a trend toward blurring of the traditionally separate cataloging and acquisitions units that made up the TS department of the library.

CATALOGING

Cataloging is the process of describing materials for the purpose of compiling inventories and providing organized access to the collections. Relative to the movement of materials within TS, cataloging usually follows the receipt of ordered books in acquisitions. There are two types of cataloging: original and copy. Original cataloging entails the creation of the bibliographic description from scratch. Cataloging has three components: description, subject analysis and classification, and authority control. Descriptive component includes recording the attributes of an item: its author, title, publisher, the number of pages, its size, etc. This component allows the user to find and identify a book, by the author's name, the title, edition, size, etc. Subject analysis and classification are considered the intellectual elements of cataloging. Subject analysis entails determining the subject matter of the item and assigning corresponding subject headings from a controlled vocabulary, such as Library of Congress Subject Headings, Medical Subject Headings from the National Library of Medicine, or a variety of other thesauri, depending on the cataloging rules of a particular country. Classification of materials is done according to their discipline and topic, and is, therefore, closely tied to subject analysis. There are two main classification schemes in the United States: Dewey Decimal Classification (DDC) and Library of Congress (LCC). The DDC system is primarily used by public libraries, whereas LCC is preferred by academic and research libraries. The cataloger assigns a classification, or call number, in correlation with the subject headings. The call number serves a dual purpose: it determines the place of a book on the shelf and it collocates books on the same topic next to each other.

Authority control is the process that is applied to both descriptive and subject analysis parts of cataloging. It ensures the consistency and correctness of names and subject headings entered into bibliographic description. It also functions as a collocation and disambiguation device in the library catalog. Through authority control, the works written by the same author under different pseudonyms will be gathered in a single search due to behind-the-scenes cross-references; Multilanguage translations of a book or a musical piece will be brought together. By the same token, conflicting entries, such as common names, will be distinguished from each other through specifying information, for example, date of birth, death, etc.

Copy cataloging, which became possible with the practice of shared cataloging, represents the process of using the bibliographic record of an item created by another library to describe the same item held in the local collection.

Most TS departments perform both types of cataloging. However, the ratio between original and copy cataloging depends on the type of the library. Libraries holding a lot of unique materials have a substantial proportion of their

cataloging done as original, whereas libraries with mainstream materials rely heavily on copy cataloging.

The distinction between original and copy cataloging determines the requirements for skills and education of personnel. While the relative ease of copy cataloging permits employment of paraprofessional staff, original cataloging is still considered the domain of professional catalogers with a master's degree in Library Science, although shrinking resources and increased workload create a trend of employing cataloging assistants for original cataloging as well.

In addition to cataloging itself, cataloging units also perform database (or catalog) maintenance. This is done in order to keep the catalog accurate by reconciling data conflicts, correcting mistakes, and reflecting changes in regards to cataloging. Larger libraries often have database maintenance as a separate section.

Cataloging has a rich history. Throughout the centuries, it underwent major transformations following changing needs of the society and advances in technology. The earliest known compilation of a catalog of a collection was completed in 1558 and was called the Catalogue of Bretton Monastery Library.^[6] In 1759, the Trustees of the British Museum expressed the desirability of a catalog and further suggested in 1807 that a separate alphabetical catalog for each collection be compiled as well as a general classed catalog.^[7]

In 1841, one of the founding fathers of modern cataloging Sir Anthony Panizzi, keeper of the printed books at the British Museum, published his *Rules for the Compilation of the Catalogue* where he considered the same problems of choice and form of entry, description, cross-referencing, and filing order that are repeated in codes to the present day. In the United States, Panizzi's ideas were taken up and modified by Charles Coffin Jewett, librarian of the Smithsonian Institution, who needed standardized rules in order to accomplish his plan of collecting bibliographic data and making it available for printing individual library catalogs.^[8] He compiled the very first United States' code of cataloging rules that was issued in 1853. In 1876, Charles Cutter's *Rules for a Printed Dictionary Catalog*, the dictionary catalog, was becoming the dominant form.^[9] His rules went through four editions between the first in 1876 and 1904, and increased in coverage and were a major influence over later codes.^[8]

At the dawn of the twentieth century, the LCC, the principal cataloging agency, began selling library catalog cards. This caused a much greater degree of consistency in library catalogs and ushered in the era of copy cataloging. Up to that moment, libraries were responsible for creating their own original descriptions of the materials in their collections; thereafter, they gained a choice of buying those descriptions from the LCC. In 1908, the *Anglo-American Cataloging Rules* were first published and were called that because of the cooperation between the British and American catalogers, and were the offspring of Cutter,

plus accommodation to the LCC practice.^[10] Seymour Lubetzky, who was working at the LCC at the time, wrote *Cataloging Rules and Principles*, in which he suggested the requisites of a new code.^[11] Within the next 7 years, he also presented two revised codes that eventually became the basis for the AACR.^[12,13] In 1967, two versions of the *Anglo-American Cataloguing Rules* were published, a North American text and a British text.^[14] Finally, in 1978, the rules were published in one version as *Anglo-American Cataloguing Rules, second edition* (AACR2).^[15] The AACR2 was adopted by the LCC, the National Library of Canada, the British Library, and the Australian National Library in January 1981.^[16] There were subsequent revisions to the second edition that were published in 1988, 1998, and 2002.^[17]

The major developments in the area of cataloging and bibliographic retrieval of the twentieth century can be characterized first of all as a period of growth and development of productivity. The adaptation and use of technology and standards such as machine-readable cataloging (MARC), based on ISBD's (International Standard Bibliographic Description) eight areas of description, has enabled libraries to standardize and share bibliographic records. In addition, with the dawn of the computer and the start of the information age, libraries began to either develop their own internal library software systems or increasingly started buying them from the growing numbers of library software vendors such as GEAC, CLSI, among a number of other early pioneering library software vendors.

The twentieth century was also marked by the development of bibliographic networks, such as Online Computer Library Center (OCLC) and Research Libraries' Network (RLIN). In 1967, the Ohio College Library Center developed a computerized system in which the libraries of Ohio academic institutions could share resources and reduce costs.^[18] In 1977, the Ohio members of OCLC adopted changes in the governance structure that enabled libraries outside Ohio to become members. In 1981, the legal name of the corporation became Online Computer Library Center, Inc.^[19] RLIN started in 1974 as a competitor to OCLC and was focused primarily on research libraries and specialized research collections, like art, law, etc. The development of these bibliographic utilities contributed to the rapid growth of copy cataloging and resource-sharing among libraries nationwide.

The natural outgrowth of shared cataloging was the establishment of cooperative programs by the LCC. During the 1970s, LC initiated NACO and CONSER programs. NACO stands for the Name Authority Program Component for the Program for Cooperative Cataloging (PCC) that was developed by the LCC in order to share the name authority work previously done only by the LCC. Through this program, participants contribute authority records for names, uniform titles, and series to the LCC Name Authority File.

An individual institution may join this program or a group of libraries with a common interest may form a funnel project to contribute records via a coordinator. Participants agree to follow a common set of standards and guidelines when creating or changing authority records in order to maintain the integrity of a large shared authority file. This file helps the global library community work more efficiently and effectively, allowing it to maximize its resources.^[20]

CONSER began in the early 1970s as a project to convert manual serial cataloging into machine-readable records and has evolved into an ongoing program to create and maintain high-quality bibliographic records for serials. In keeping with its evolution, the name was changed in 1986 from the CONSER (CONversion of SERIALS) Project to the CONSER (Cooperative ONLINE SERIALS) Program. In October 1997, CONSER became a bibliographic component of the PCC.^[21]

Building on the success of NACO and CONSER, in 1995, LC established the PCC that subsumed NACO and CONSER as two of its four components. The primary goal of PCC is to cooperatively enhance the timely availability of bibliographic and authority records by cataloging more items, producing cataloging that is widely available for sharing and use by others, and performing cataloging in a more cost-effective manner.^[22]

The third component of PCC deals with contribution of bibliographic records for monographs in all formats and is called BIBCO. The fourth and final component of PCC—Subject Authority Cooperative Program (SACO)—deals with subject authority.

The SACO was established to provide a means for libraries to submit subject headings and classification numbers to the LCC via the PCC.^[23]

The emergence of digital materials expanded the field of information standards. In addition to MARC, which was devised for print format, there appeared standards for the description of digital materials, such as Dublin Core, Metadata Encoding and Transmission Standard, and some others. Local Integrated Library Systems (ILS) acquired web interfaces, and library catalogs evolved from being accessible strictly from designated terminals to become available on the Internet.

The beginning of the twenty-first century was marked by a trend toward mergers and acquisitions in the area of TS. In 2006, two major library networks and union catalogs, OCLC and RLIN, merged into one company—OCLC. This move created a single bibliographic database and cemented OCLC's role as the leader in shaping TS practices in acquisitions and cataloging. ILS vendors continued the acquisition trend reducing the library software market to a few major companies. In competition to proprietary systems, emerging on the scene are open-source applications, such as Koha and Evergreen. While integrated library systems have front-end (i.e., public) and back-end (i.e., nonpublic) modules, the implementation

of the new ILS and their upgrades, as well as library-wide training and documentation, often rests on TS.

The advent of the Internet in the 1990s had a major impact on the work of library services. It brought on a sharp division of publications into print and online formats with print being quickly replaced by the Internet-based matter, especially in the area of periodicals but increasingly electronic books as well. Cataloging services and tools migrated online and became available through such LCC's instruments as Cataloger's Desktop and Classification Web. However, the exponential growth of electronic resources created a cataloging dilemma for TS. Shrinking library budgets, increased volume of work, and the rising cost of cataloging spurred a trend toward simplification and streamlining of descriptive cataloging rules. The emergence of large online aggregations of electronic books and journals created the alternative to catalog access methods to the resources, for example, A–Z lists and databases, thus raising a national debate about the diminishing role of the catalog and cataloging itself as the conduit to the collections.^[24–30]

At the same time vendors, publishers, and intermediaries entered the TS scene offering bulk cataloging, acquisitions services, and outsourcing of authority control. In 2004, in the article entitled “Taking the drudgery out of book acquisitions,” which appeared in *Library & Information Update*, talks about the services of a book supplier whose services now include online searching of item record databases; browsing of databases that include sample pages, contents, online ordering using EDI, order management, shelf-ready stock with OPAC-ready records, automated alerts for items that based on your libraries profile may be of interest to your library.^[31] Major book vendors, such as YBP, and others began bundling their primary business—the book trade—with cataloging and materials processing, thus offering a replacement for services that traditionally were carried out by library's TS. While providing a faster turnaround time and, in many cases, reducing the cataloging, authority control, and processing costs, outsourcing earned its skeptics. The downside of outsourcing is primarily tied to the quality of services provided by vendors and the need by TS to maintain quality control processes in order to uphold the standards and ensure the accuracy of records. When new libraries are being started, they generally use outsource vendors to provide them with opening day collections to fill the library on their opening day with wide-ranging and popular books available to the public.

With the increasing use of the Internet since the mid-1990s, many journals transitioned to electronic formats. Libraries began offering numerous article databases with varied interfaces, which felt cumbersome to both librarians and users, especially when compared to the relative ease and accuracy of Google searching. In order to resolve this issues, starting in the late 1990s and early 2000s Roy Tennant and others suggested federated searching (also

known as metasearching) as the solution.^[32] The principle of federated searching, which ultimately proved too limiting and slow,^[33,34] was searching multiple sources from a single point. The development of web-based Google Scholar and problems with Federated Searching led to calls for a development of a resource that could compete with Google.^[34]

The emergence of online materials introduced a new function to TS—administration and management of electronic collections. Libraries moved from subscribing to individual print journals to subscribing to e-journal aggregations, abstract and indexing services, and article databases. Online materials spurred the development of new technologies, such as tools for linking between the citation and full text via OpenURL or Digital Object Identifier, and for managing electronic resources. The issues of management, access, and licensing of electronic materials created the need for specialized positions on professional and paraprofessional levels. Many libraries introduced the job of an electronic resources librarian, or its variants, and dedicated the support staff to this function. These positions commonly deal with administration of licensing agreements, resolution of access issues, and maintenance of databases at the root of the access tools, such as the knowledge base of a link resolver and an electronic resources management system (ERMS). The principles of ERMS as a management tool for electronic resources were developed by Digital Library Federation. They encompass listing and descriptive; license-related; financial and purchasing; process and status; systems and technical; contact and support; and usage functions.^[35] A rapid growth of digital materials encoded in non-MARC metadata created parallel virtual collections and thus separate silos of information for many libraries.

Library information technology developers created the first generation of enterprise Google-like search engines, which became known as discovery interfaces. They began to emerge in 2002 with AquaBrowser from Medialab Solutions, capable of cross-searching the library's diverse collections, such as digital libraries, databases, and the catalog. It was about 2006 when this software genre saw Primo from Ex Libris and Encore from Innovative Interfaces, Inc. launched. In 2007, an open-source option VuFind became available. In 2009, Serials Solutions, EBSCO, OCLC, and Ex Libris all made announcements they would combine the next-generation interface technologies with large bodies of content into one single index^[36] allowing access to more results much faster and with better deduplication and relevancy ranking than federated searching.^[37,38] Implementation of such systems significantly increased users access to full-text articles as well as to web resources.^[32]

The new discovery products provide a more modern, web interface, broader approach to discovery, and access to social networks. Discovery interfaces incorporate newer tools such as tagging, integrated social features,

easier search and navigation, and relevancy-ranked results.^[36]

The library catalog has been changing with the times as well. Bringing Amazon-like experience to the library, many bibliographic records now have links to the online table of contents, publisher and author information, and reviews. The evolution of the web into an interactive experience with user-generated content left its mark on the public face of the catalog. Main problems with the traditional online catalog was that it did not include the deeper content of its collections such as the contents of its periodical collections, local digital and special collections, which were cataloged using systems outside of the traditional integrated library systems. Library patrons did not understand the entire library's holdings were no longer in the library catalog, and their interfaces were text-based and dated in comparisons to the Internet search engines.

A new generation of catalogs emerged, such as Endeca and OCLC's WorldCat Local, that provide faceted browsing and navigation of results similar to the Internet search engines. Legacy library catalogs became capable of displaying images of book jackets, sending text messages, integrating users' input through book reviews and recommendations, and tagging using non-LCC, community-generated terms.^[36]

As the nature of the work changed, the name TS and the units within TS have begun to change as well. Cataloging has changed to names such as Bibliographic Assess, Metadata Services, Metadata and Digital Library Services, while TS name has changed to such things as Collection Support Services, Materials Acquisitions Processing Services, and Collection Access and Management Services.^[39]

The opportunities provided by the electronic information exchange increased national and international cooperation between libraries in the arena of shared cataloging.

The report produced by the IFLA Study Group on Functional Requirements for Bibliographic records (FRBR)^[40] contains a description of the conceptual model (the entities, relationships, and attributes), a proposed national-level bibliographic record for all types of materials, and user tasks associated with the bibliographic resources described in catalogs, and other bibliographic tools.^[41] Aiming to conceptualize the entire bibliographic universe, the FRBR report introduced the new vocabulary to describe bibliographic entities. Such terms as "work, expression, manifestation, item" as well as user tasks defined as "find, identify, select and obtain" influenced the bibliographic lexicon. The next set of cataloging rules, Resource Description and Access (RDA), the successor to AACR2, uses FRBR terminology and its user-centric approach in its contents.^[42]

The work on adapting *Anglo-American Cataloging Rules* to the new digital world began in 2004 by Joint Steering Committee, and initially as AACR3, the next revision of AACR2. As the work progressed, it appeared that the existing standard could not accommodate the

changes in publication models of the twenty-first century. The cataloging community comments to the early drafts demonstrated that the proposed changes were not sufficient. This led to the shift to a new approach in devising a new cataloging standard, and the new name RDA: Resource Description and Access was adopted in 2005. The scope of RDA is defined as "a set of guidelines and instructions on formulating descriptive data and access point control data to support resource discovery."^[43] RDA was conceived as a content standard with the following features: rules that are easy to use and apply; it is designed for an online, networked environment; provides effective bibliographic control for all types of media; presents a logical structure based on internationally agreed principles (e.g., FRBR, FRAD); compatible with other standards, and is of use beyond the library community.^[44]

The first draft of RDA, followed by the comments period, was issued in November 2008. The new cataloging standard sparked a dynamic discussion within the profession. The comments provided by the cataloging community reflected a wide range of views: from the appreciation for inclusion of FRBR/FRAD data models and the collaboration with publishing community, to sharp criticism on the lack of clarity and failure to address the needs of special formats' cataloging, such as maps and moving images.^[45] The revised text, based on the feedback, was finalized in June 2009. RDA was released as an online subscription product, named the RDA Toolkit, in June 2010.^[46] Three national libraries—the LCC, the National Library of Medicine, and the National Agricultural Library—as well as the broader constituency, conducted a testing process that ran from October to December of 2010. As the result, the recommendation from the testing group was to continue improvement of RDA and postpone its implementation until 2013.^[45] Subsequently, RDA implementation day was set by the LCC for March 31, 2013, when it became the new cataloging standard.

The emergence of RDA with its expanded scope and a new model triggered changes in MARC format, previously designed to support AACR2. In order to accommodate RDA, the number of MARC fields and codes was increased, the rules for mandated, repeatable, and nonrepeatable fields evolved to allow more flexibility, and the terminology was augmented or changed.^[47]

MARC has been serving the library community since the 1960s, providing the structure for bibliographic data. However, as a format designed for libraries, MARC became a constraint on the use of bibliographic data interchange between publishers, vendors, and a broader networked community. MARC is principled on the concept of a record, thus making each description a discrete and closed data set, enabling vast duplication of data, and disabling relationship between the entities encoded in the record. In order to break down the insulation of the bibliographic data from the networked information exchange, as well as within MARC corpus itself, in 2011, the LCC

announced Bibliographic Framework Initiative to redesign the underlying structure of the data description.^[48] The following year (2012), the new data model for bibliographic description, named BIBFRAME, emerged.^[49] As described by the LCC, “instead of bundling everything neatly as a ‘record’ and potentially duplicating information across multiple records, the BIBFRAME Model relies heavily on relationships between resources (Work-to-Work relationships; Work-to-Instance relationships; Work-to-Authority relationships). It manages this by using controlled identifiers for things (people, places, languages, etc.).”^[50] A limited number of libraries—among them LCC, Cornell, Princeton, Stanford, and National Library of Medicine—are currently testing the BIBFRAME model. At this point, there is no target date for the implementation of the BIBFRAME environment.^[50]

The changes occurring in TS with the advance of technology, network environment, and new standards have altered the requirements for staff skills set. Modern-day catalogers and acquisitions specialists need to understand the mechanics of EDI, know not only the current bibliographic format and other metadata schemes (e.g., Dublin Core for cataloging digital libraries), but be prepared for their replacements in the rapidly changing environment. In addition to technical skills, TS staff need to be flexible, open to change, and be willing to learn.

COLLECTIONS MANAGEMENT

Despite the rapid growth of digital resources since the advent of the Internet, print materials continue to play an important role in library functions. In many libraries, processing, and mending of print resources is in the purview of TS; it is the final step in the acquisition-to-shelf cycle of materials movement. While there are variations in the order of processing steps, a typical workflow is designed as follows: once the books and print periodicals arrive in the library, they are received, cataloged (i.e., an electronic record describing the item’s physical and subject attributes has been created in the local system), and then the items go to the materials processing section. There, items are stamped with a property stamp, indicating the ownership of a book, a date due slip is pasted for circulation to note when an item is due back in the library after the checkout, a call number (or classification number) label is affixed so that the item is shelved in the logical order, and, finally, a barcode linking the physical piece with its electronic record in the catalog is attached to the book. Additionally, processing may entail adhering Mylar covers, security beepers, and reinforcement of publisher’s binding. Regular binding of periodicals and monographs is usually contracted out to a binding facility.

Collections management, along with other spheres of the library, has been impacted by the technology. In addition to

now routine barcodes and security devices, Radio Frequency Identification (RFID) entered the library scene. While having the potential of replacing barcodes and tattle-tapes by combining their functions, RFID has been slow to spread. Despite the convenience with inventorying, shelving/retrieving items, and detecting and tracking theft, the considerations of patrons’ privacy, as well as the cost, prevent this technology from broad adoption by library community.

As electronic information exchange ties the processes of libraries and their book vendors closer, the latter began expanding their services into materials processing, leveraging the information they receive from libraries and bulk cataloging services, such as OCLC WorldCat Cataloging Partners (formerly PromptCat). If a library outsources its materials processing, the books come back with the full set of processing elements, such as classification labels, property stamps, barcodes, etc.

CONCLUSION

Historically, TS have been the behind-the-scenes backbone of the library. Today, more than ever they play a crucial role in the delivery of user services by providing support to information search and retrieval tools and access to online materials.

The current trends in automation, development of new library standards, evolution of the OCLC library network into a major tool for universal bibliographic control that provides access to the collections of libraries, museums, and other cultural institutions worldwide, make the work of individual TS department’s part of global information network. In addition, adoption of the native Internet tools, such as faceted browsing, user-created content, and integration of social media, by libraries signifies a continuing trend toward user-centric and interactive interfaces.

TS, especially cataloging departments, are undergoing major changes. The implementation of RDA and development of new data model, BIBFRAME, will test the viability and robustness of the new library standards.

Linguistics and the Information Sciences

John C. Paolillo

School of Informatics and School of Library and Information Science, Indiana University, Bloomington, Indiana, U.S.A.

Abstract

Linguistics is the scientific study of language which emphasizes language spoken in everyday settings by human beings. It has a long history of interdisciplinarity, both internally and in contribution to other fields, including information science. A linguistic perspective is beneficial in many ways in information science, since it examines the relationship between the forms of meaningful expressions and their social, cognitive, institutional, and communicative context, these being two perspectives on information that are actively studied, to different degrees, in information science. Examples of issues relevant to information science are presented for which the approach taken under a linguistic perspective is illustrated.

INTRODUCTION

Linguistics is the scientific study of language, where language is generally taken to be *natural language*, spoken by human beings and acquired informally from one's parents, siblings, and community. Natural language is contrasted with written language, which must be learned formally; artificial languages, which are intentionally designed for some purpose such as intercultural communication; and formal languages, like those of computer science, mathematics, and logic, which are designed to express abstract meanings in well-defined ways. To the extent that these other types of language resemble natural language in their structure or use, a linguistic perspective may be relevant to understanding them. Linguistics has a long history which can be traced to ancient sources such as the *Ashthadhyayi* of Panini, an Indian grammarian of the fifth century B.C.E., or the invention of the Phoenician and Ugaritic alphabetic orders approximately 1000 B.C.E.,^[1] but its modern practice is largely based on the structuralism of Ferdinand de Saussure^[2] and Leonard Bloomfield,^[3] the anthropological perspective of Edward Sapir,^[4] and the formal perspective of Noam Chomsky.^[5–7]

Natural language is a highly complex phenomenon, and consequently the field of linguistics has a great deal of internal structure, with largely separate subfields for specific areas of linguistics. At the same time, linguistics has close interactions with fields such as psychology, anthropology, sociology, computer science, education, and communications, thus many applied and “hyphenated” areas of linguistic study are found as well.

The aim of this entry is to explain the organization of linguistics as a field, to identify some of its main points of interaction with the information sciences (broadly construed to include the full spectrum of studies focused on information technology and its uses, from technical research and development to applied social science, including

information retrieval, information seeking behavior, information policy, human–computer interaction, etc.), and to provide indications of where and how linguistic approaches might benefit the information sciences. The organization of this entry is as follows. The next section describes the structural subfields of linguistics, describing the questions that each addresses. The third section treats hybrid subfields of linguistics, whose questions are not strictly about language structure but which deeply involve either external context or application of some sort. The fourth section identifies a number of linguistic issues in the information sciences. The final section offers some general conclusions. Computational linguistics, Natural Language Processing (NLP), and information retrieval are not discussed in any depth in this entry. Instead, emphasis is placed on the range of questions addressed in the field of linguistics and their relevance to the information sciences.

STRUCTURAL SUBFIELDS OF LINGUISTICS

Although linguistics is small relative to other fields, in terms of the number of people working within it, linguists tend to specialize, so that their work specifically addresses one or more subfields; few linguists consider themselves “generalists.”

A major focus of linguistics is language structure, and linguistics is a largely structuralist field, in the sense that it concerns itself with categories of entities and their relations to one another. Other philosophical orientations exist in the field, notably the Cartesian mentalism of Chomsky which posits innate cognitive structures governing language, but other philosophical movements shared among social science and humanities fields, such as the postmodern turn, have not had a strong impact on linguistics. Moreover, in actual practice, structuralist forms of inquiry and analysis, as laid out by Saussure and Bloomfield, are

fundamental to most forms of analysis in the field. In some sense this is inescapable, at least in so far as human languages have regular patterning, and that patterning is shared among different speakers of a language. It is tempting to treat the language as an object unto itself, independent of the speakers or their contexts, however it arises.

Linguistics is typically taught starting from a “core” of its structural subfields, characteristically organized in terms of analytic “levels” of structure (not unlike the “layer-cake” model of the organization of WWW protocols and standards, see below). At the lowest level, linguistics considers the sound structures of human languages: which sounds are possible in a language, and what sequences of sounds are possible, their articulatory mechanisms, acoustic perception and patterns of relationship with other sounds. This is the domain of *phonetics* and *phonology*. One level above this is the structure of words, and the patterns of relationship among word structures that take meaning into account. This is the domain of *morphology* and the study of the *lexicon*. At one level above this, linguists consider the arrangement of words into well-formed utterances (i.e., those accepted as “grammatical” by a native speaker). This is the domain of *syntax*. The study of the meanings of these utterances, how they are built from the meanings of their parts, together with the meanings of words themselves, comprise the study of *semantics*. Beyond this, linguists recognize a level of *linguistic pragmatics*, which deals with the ways in which linguistic expressions are used, such that conventional or contextual meaning can differ from literal meaning.

A characteristic common to all of these levels is a property sometimes called “duality of structure.” Originally, this term described Saussure’s notion of the arbitrariness of the linguistic sign, i.e., that forms of words in any language have no necessary relationship to their meaning, and that sounds and meaning are arbitrarily associated. The principle is more general than this, however, as it can be seen that units at each level of structure are essentially independent. Lower levels of structure (e.g., sounds) may be referred to in higher levels of structure (e.g., morphemes, words) but the patterns that obtain at each level have no necessary relation to those of the other levels, and a similar arbitrariness of relation between all different levels of language structure can be observed. In the following subsections, the major structural subfields of linguistics are described. The following section details some of the more important hybrid areas of linguistics, ending with its more applied subfields.

Phonetics and Phonology

Phonetics is the study of the sounds of languages, their articulatory and perceptual properties, and patterns of regularity found therein. Phonetics is thus concerned with the material reality of language sounds, and is not concerned

with what makes the sounds of languages meaningful. Phonetics makes extensive use of instrumentation, such as audio recording, spectral and other forms of acoustic analysis, and x-ray and video recording. Phonology is the study of the sound systems of languages, where differences in sound that carry meaning in a language are considered. To illustrate the difference in these two levels of analysis, consider the sounds represented by the letter *p* in English words like *pot* and *spot*. In *pot*, where the *p* is the first sound in the syllable, speakers of most dialects of English will produce a short burst of air (“aspiration”) immediately after the release of the lips (symbolized [p^h]), whereas in *spot*, no aspiration is produced (symbolized [p]). There is a phonetic distinction between these two sounds or *phones*, but speakers of English nonetheless recognize these as the “same” sound. In another language such as Hindi, a difference between the two phones is enough to yield entirely different words, e.g., [p^hal] “fruit” and [pal] “instant, moment.” Hence in Hindi, the phones [p^h] and [p] correspond to distinct phonemes /p^h/ and /p/, whereas in English, both phones correspond to the single phoneme /p/.

Phonetics and phonology illustrate an important principle in linguistics, namely that of *etic* (as in “phonetic”) and *emic* (as in “phonemic”) levels of description of a phenomenon. The etic level is what is empirically observable in a given instance, whereas the emic level is what is perceived by the native speaker of a language to be distinct. This distinction is maintained most robustly at the level of sound structure, but is found at other levels of structure as well.

Phonology is concerned with matters beyond the existence of categories of sounds used to describe the utterances of languages. It is also concerned with regularities of patterning that exist in sounds. These patterns include *phonotactics*, the sound sequences that can occur in a language (e.g., English permits words like [spat] “spot,” but not [vpat] or [fpat], although these may be possible in other languages), and *phonological processes*, in which the juxtaposition of two words may result in a sound sequence that the words would not have exhibited independently (e.g., /kænt/ “can’t” + /yu/ “you” yields [kænsu] “can’t you”). Phonological processes sometimes depend on the identities of the specific forms to which they are attached, in which case they are referred to as *morphophonemic processes*. Phonological theories sometimes make a distinction between the two types of patterns, such that phonotactic patterns are governed by constraints (extrinsic conditions on what can or cannot occur in a language), whereas phonological processes are handled by *rules*, which are understood as cognitive or descriptive processes that transform one sequence into another. Current phonological theory tends to follow the approach of Optimality Theory^[8] in conflating the distinction, regarding both types of patterns as the consequence of a common set of constraints. The reasons for this are somewhat

technical, and the interested reader is referred to discussion in the relevant literature for further explanation.

Morphology and Lexicon

Morphology concerns the structure and forms of words, and patterns in their relations to one another. The lexicon is the store of words of a language, hence morphological patterns have a lot to do with the lexicon, but not all patterns in the lexicon are morphological. A morpheme is considered to be the most basic meaningful unit of language: it is a form–meaning pairing which ceases to be meaningful if it is subdivided further. As in sound structure, we may speak of an emic and an etic level in morphology: morphemes are realized as different specific variants (known as “morphs”) in one context or another. For example, in English the word *card* is a singular noun referring to a stiff piece of heavy paper, which can be expressed in the plural as *cards*, for multiple stiff pieces of paper; similarly, the noun *winch* refers to a mechanical device for pulling or raising something, also in the singular, whose plural is *winches*. In contrast to these two, the noun *mouse*, meaning a small rodent, has the plural *mice*. All three types of plural exhibit regularity in the sense that there are other exemplars with the same characteristics: *shoe~shoes*, *peach~peaches*, *louse~lice*. All three patterns, adding [-z], adding [-ez] and changing the stem vowel, are alternant morphs of the plural morpheme. Of these, the plural morph in which the stem vowel changes is the less common pattern, and one readily finds examples where it could be expected to occur but does not: *spouse~spouses*. Irregularities in morphology of a language are common, and typically the reasons for it are historical in nature, concerning the evolution of the lexicon and its relation to sound change, etc. The vowel-changing plurals were once the dominant pattern in Old English, for example, but most of the pattern was lost in the Great Vowel Shift between Middle and Modern English (between 1200 and 1600 A.D.) which radically altered the pronunciation of most English vowels.

Languages differ in terms of the kind of morphological patterns they exhibit. On the one hand, languages show morphological *inflection* if words change form based on their grammatical function (subject, object, etc.); Latin, Greek (ancient and modern), and Finnish are three such languages. *Derivational* morphology, on the other hand, derives words of one category (such as nouns) from those of another (such as verbs). Languages may be *analytic*, having separate morphemes for clearly separate functions, or *synthetic*, where a single morpheme may simultaneously serve otherwise unrelated functions. Languages like Turkish tend to be more analytic, while Inuit (an Eskimo language spoken in Nunavut, Canada) and Onondaga (a Native American language of New York State) are more synthetic. Languages whose words are often composed of long sequences of analytic morphemes are said to

be *agglutinating*; Turkish and Tamil are examples. Some languages, such as Mandarin Chinese, are said to be nearly entirely lacking in morphology.

Beyond morphology, many other linguistic patterns exist in the lexicon. Relations between languages, via lexical borrowing, are often observable in the lexicon, and sometimes languages borrow from their own past, resulting in entire classes of archaic words. Such lexical items may also systematically differ in *register*, i.e., their appropriateness for formal or informal circumstances; this is common in *diglossic* languages such as Arabic, Greek, Tamil (spoken in South India), and Sinhala (spoken in Sri Lanka), in which spoken and written forms of the language are structurally highly divergent.^[9] Other lexical patterns revolve more closely around meaning: homonymy (words with identical meanings, e.g., *bird* and *avian*), antonymy (opposite meanings, e.g., *hot* and *cold*), hypernymy (a similar but more general meaning, e.g., *songbird* and *bird*), and hyponymy (a similar but more specific meaning, e.g., *songbird* and *sparrow*) are some of these patterns.

Syntax, Semantics, and Pragmatics

The arrangement of words into larger units, namely phrases and sentences, is the domain of syntax. Traditionally, morphology and syntax taken together were known as “grammar”; this term is currently dis-preferred by linguists. For several decades, syntax has held a dominant position in linguistics, due largely to the influence of Noam Chomsky and his approach to syntax known as *Generative Grammar*. Basically, the generative approach seeks to explain properties of language as manifestations of *linguistic universals*, which are regarded as properties of a uniquely human language faculty, distinct from other cognitive capacities. Since *Universal Grammar* (UG), as it is sometimes called, is held to be a universal human species characteristic, its effects are expected to be equally manifest in all languages. The differences among languages are regarded as interactions between UG and a child learner’s linguistic experience. Variants of this theory are employed by people working in other formal frameworks such as *Lexical-Functional Grammar*,^[10] *Relational Grammar*,^[11,12] and *Head-Driven Phrase Structure Grammar*.^[13,14]

Generative grammar and the theory of UG have been controversial since first being proposed in Chomsky’s 1955 dissertation. A number of current alternative theories adopt somewhat different starting assumptions. For example, Cognitive Grammar,^[15] while it emerged out of one branch of Generative Grammar in the 1970s,^[16] regards properties of language as emergent from more general cognitive principles, such as iconicity,^[17] metaphor,^[18] and embodiment.^[19] Closely allied to this are a range of approaches that can broadly be considered *Functional* approaches to grammar, represented by various authors

such as Croft,^[20] Fillmore and Kay,^[21] Givón,^[22] and Hopper and Traugott.^[23] As the label suggests, functional approaches to syntax seek to explain the construction of sentences based on their function, e.g., for communication. Functionalism is often contrasted with *formalism*, where by “formal” what is meant is an emphasis on form, as in the sense of formal logic.

Functional accounts of language syntax often make appeals to principles of linguistic semantics and/or pragmatics (such appeals are rarer in the generative literature). Linguistic semantics is the study of the meanings of natural language expressions, while pragmatics refers to the real-world uses of utterances that are often not reflected in their literal meaning. For example, the utterance “Can you pass the salt?” is literally a yes/no question about the addressee’s ability to perform an act. A semantic analysis of the sentence would be expected to account for how this meaning is obtained from the component words and their combination into phrases; such analyses tend to emphasize formal, set-theoretic interpretations, which employ various forms of logic to state meanings and their relations to linguistic forms.^[24]

Conventionally, the same utterance is used as a request to the addressee that s/he perform an act. A pragmatic analysis must account for how the utterance’s conventional meaning differs from its literal meaning in this systematic way. Austin^[25] approached this problem from the perspective of *speech acts*, observing that certain types of utterances explicitly perform conventional acts, under the right circumstances (e.g., “I promise to answer,” “I sentence you to 5 years in prison”) and analyzed all utterances as operating under an implicit “performative” of some kind, even if it is not linguistically present. Grice^[26] opted for a different approach, in which he invoked a general *cooperative principle*, according to which people in a conversation assume that others in the same conversation are being cooperative, and they tailor their contributions accordingly. Utterances that are apparently noncooperative on the surface are permitted if they rationally lead to one or more *implicatures*, i.e., nonliteral interpretations that are the real communicative intent of the speaker. Both the speech acts approach and the Gricean approach remain influential in contemporary linguistics.

Discourse Analysis

Linguistic structure does not end with the sentence, but rather, sentences can be seen to be structured at yet higher levels. These are collectively known as “discourse,” and the branch of linguistics that addresses structure beyond the sentence is known as Discourse Analysis. Discourse Analysis is characterized by two main foci of interest: longer texts, whether as written texts or oral performances, and dyadic or multiparticipant conversations. The former focus is best represented by *Text Analysis*, while the latter

is known as *Conversation Analysis*. Text Analysis primarily addresses how texts function as units, their internal structure in terms of narrative units and/or rhetorical acts, and the role of sentence-level grammar in contributing to that structure (via discourse markers, emphasizing and topicalizing constructions, etc.). Similarly, Conversation Analysis addresses the characteristics of conversations that permit them to function as units, examining turn-taking mechanisms, sequencing of speech acts, and cross-cultural and gender differences in the ways conversation unfolds. A third branch, known as Critical Discourse Analysis, applies the tools of both Text Analysis and Conversation Analysis to social criticism. For example, one might examine the use of passive constructions to mask the agency of powerful actors (e.g., the government, the army, etc.) in the news reportage of war or other political events. This in combination with observation of other linguistic strategies can be used to expose and examine the ideologies of different societal actors as encoded in their communications, and how such ideologies relate to the actors’ stakes in the current events of the day.

HYBRID SUBFIELDS OF LINGUISTICS

Historical Linguistics and Language Classification

Modern linguistics is very much shaped by the awareness that languages are not static, and that change in historical time affects language in numerous ways. The study of language change is known as Historical Linguistics. One of its main methods is the *comparative method*, in which languages hypothesized to arise from a common ancestor are compared, typically by comparing words with similar form and meaning in the different languages (called “cognate forms” or “cognates”), to ascertain the degree and nature of relationship among the languages. The outcome of this is typically a language classification, in which groups of languages are said to be related across splits in the language group at different time depths. The best known example of this, and the longest established language family, is the Indo-European language family, members of which are spread over the entire globe, with members as diverse as Albanian, Dutch, English, French, German, Greek, Italian, Russian, Spanish, etc., in the European branch, and Assamese, Bhojpuri, Farsi, Gujarati, Hindi-Urdu, Kashmiri, Marathi, Punjabi, Romani, Sinhala, Tajik, etc. in the Indo-Iranian branch. Subfamilies are also recognized, such as the Germanic languages, represented by Dutch, English, and German in the above list. These share structural properties not shared by the other languages of the Indo-European family, in particular a series of consonant mutations known as “Grimm’s Law,” in which Proto-Indo-European voiceless stop

consonants became fricatives in Germanic, such as the /p/ ~ /f/ correspondence in *padre* (Spanish), *pater* (Latin) ~ *father* (English), *vater* (German).

The genetic groupings provided by the comparative method are the main source of information for most language classifications, such as those used in library cataloging (see the discussion of ISO 639-3, below). A major challenge for the comparative method is lexical borrowing, and most languages with any degree of contact with other languages at all in their history exhibit borrowing to some extent. Some historical linguists see borrowing or *diffusion* of linguistic features as an important mechanism in language change that leads to *areal* features, i.e., linguistic features that are shared among languages in a geographic region, where there may be no common linguistic ancestor.^[27,28] Hence, classifications based on geographic distribution sometimes make more sense than genetic ones.

A similar problem for classification is raised by *Pidgin* and *Creole Languages*, which are mixed languages, having structural features of two or more languages, which arise in circumstances of intense and usually deeply unequal contact among speakers of different languages. Most of the creoles known today arose during the colonization of the Americas and other regions by European powers, and hence they tend to be mixed forms of European, African, and indigenous languages of the colonized areas. Pidgin languages are used only as second languages for contact between people who have no other common language, such as the Chinese Pidgin English once used in Hong Kong. Pidgins only tend to exist in the initial stages of contact, but when speakers of the contact community intermarry without having a common first language, a Creole may develop. Many of the Creole languages in existence today, from West Africa to the Caribbean, to Hawaii, and the Indian subcontinent, arose in this way during colonization. The specific challenge for historical linguistics is that the mixed character of Pidgin and Creole languages makes it difficult to assign ancestry as would normally be done in linguistic comparison. Also, it may be difficult to tell when a language has gone through a Pidgin and/or Creole stage in its past. For example, most Pygmy communities in Africa today speak one form of Bantu language or another, but it is unlikely that they originally spoke languages from this family before contact with other speakers of Bantu languages. Hence, some of the differences between the languages spoken by the Pygmy people and other Bantu languages might be attributed to a process of creolization, at some point in their past.

These things being said, “genetic” classifications, that is, classifications based on language ancestry, are the main type of classification of language discussed in linguistics. While areal features of languages (across language families) are sometimes recognized, they are generally treated as secondary to historical, ancestral relationships.

Sociolinguistics and Psycholinguistics

Sociolinguistics is the study of language in its social context, and two general areas are recognized within it: “macrosociolinguistics” and “microsociolinguistics.” Macrosociolinguistics is typically concerned with national communities and their composition, and the individual and community-level attitudes and discourses that bear on language policies, whether implicit or explicit; and *language planning*, the employment of governmental or institutional resources to promote certain language uses (e.g., in education, commerce, or the media). Microsociolinguistics is more concerned with phenomena at the individual level, such as linguistic variation across speaking styles, circumstances of use, occupations, ethnicities, and other subnational groups. Within microsociolinguistics, there are two main areas of study: interactional sociolinguistics, which overlaps greatly with conversation analysis, but also includes intercultural communication (at the individual level), and language variation and change, or urban dialectology, which examines contemporary historical patterns in language change, typically on a generational time scale.

Psycholinguistics is the study of language in relation to cognition, the brain, and the mind. Its main areas are speech perception, sentence processing, language deficits, and language acquisition. Of these, the last is probably the dominant area of inquiry, and it is described in a separate subsection below. Speech perception primarily concerns auditory processing. Sentence processing tends to focus on the syntactic parsing and semantic interpretation of sentences by human subjects, to illuminate the cognitive mechanisms involved. Language deficits, such as aphasia (a loss of the ability to produce and/or comprehend language) and anomia (inability to access common words) are studied for similar reasons, as well as for what they reveal about the organization of language processing in the physical material of the brain itself. Written language processing is not studied much within the field of linguistics, for reasons that have to do with the field’s emphasis on spoken communication, which is more of a human universal than written communication.

Language Acquisition and Applied Linguistics

While language acquisition has a central place in Generative Grammar and other linguistic theories, its study is specialized and typically requires training in psychology, especially developmental psychology. Two general areas are recognized: acquisition of a first language by children, or *first language acquisition*, and acquisition of a second language by bilinguals, whether adults or children, or *second language acquisition*. First language acquisition is generally studied by developmental psychologists and psycholinguists, and a large literature on this has been generated, both for English and for other

languages. Second language acquisition tends to be studied by language educators and psycholinguists. It is a matter of much theoretical debate and empirical study to what extent these two processes can be compared.

Computational Linguistics and NLP

Computational linguistics and NLP, both of which are treated in other entries in this encyclopedia, are considered to be part of linguistics; at the same time, the training of linguists and computational linguists/NLP researchers may have relatively little overlap. Principally this is because, at least historically, computational linguistics is mostly practiced by people with engineering, rather than linguistic, training, and the research agendas are set from within an engineering perspective (e.g., the aim of the European *Verbmobil* project was to build a portable speech-to-speech translation system), rather than from within the goals of linguistic theory (e.g., explaining language acquisition, change, or evolution). More linguists are becoming involved in NLP projects through the development of *language resources*, i.e., dictionaries and text corpora for use in NLP tasks.

LINGUISTIC ISSUES IN THE INFORMATION SCIENCES

Linguistics is relevant to the Information Sciences in a number of ways. On a basic level, much of what we call “information” is encoded in human language of some form: textual documents, audio and video media with spoken language soundtracks, logs of computer-mediated communication, etc. Many of the levels of linguistic structure or interdisciplinary approaches to linguistic analysis could potentially illuminate what is informative about the material artifacts and processes studied in the Information Sciences. Moreover, the material processes by which information is handled, exchanged, archived, etc. share with human language their fundamental patterns of structural arbitrariness along with their embeddedness within a community of users. In this way, informational processes are fundamentally linguistic: whether human languages are involved or artificial languages, whether for encoding sounds, images, or arbitrary sensor data, or for manipulating computers or other automatic systems, all of these systems involve a representation with multiple levels of arbitrary structure, meaning there are potential levels of analysis which parallel those used in linguistics. The observed structures are governed by social conventions, much as the structures of language are.

To make these parallels more explicit, consider the oft-cited “layer cake” for Web technologies. From the lowest level upward, there are various physical media for internetworking (cables, microwave signals, etc.) upon

which low-level protocols such as Transmission Control Protocol/ Internet Protocol (TCP/IP, used by most Internet applications) and Asynchronous Transfer Mode (ATM, used in high-speed networks for simultaneous use of voice, video, and data) are operated. On top of these, there are applications protocols such as Hypertext Transfer Protocol (HTTP, used by Web browsers and servers), which is used to transfer Web pages between server and client. The Web page itself is composed in either Hypertext Markup Language (HTML) or eXtensible Markup Language (XML), which is further extended via annotations in the Resource Description Framework (RDF, the metadata definition language for the Semantic Web), etc. Each of these layers represents a level of structure whose organization and interpretation are independent of those of neighboring levels. Hence Web-based communication is structured in the same way as natural language, with relatively independent levels whose operation is nonetheless important to the levels above and below for overall system functionality. Further like linguistic communications, the Web protocols are defined and elaborated by the community structures they are embedded within, much as languages are constituted and developed in the interactions of people in a speech community. Although these protocols may be defined through a formal standards process, yet again as in human language the participants in the process do not exercise equal power to influence the outcomes. The way that the protocols are ultimately used, or what protocols are adopted, is profoundly influenced by the economic and institutional power of large players such as Microsoft, just as language policy and planning outcomes are shaped by populous or economically powerful speaker groups.

A few of the ways in which the circumstances of information technology resemble those involving human language areas are discussed in more specific terms below, focusing on issues that bring language and information-related concerns particularly close together.

Semantics and the Web

The “Semantic Web” is a technology research and development project aimed at addressing information management issues with the current World Wide Web, in which the goals of search, data interoperability, and “intelligent” applications are foregrounded. Central to this project is the development of standard formats for the definition, interchange, and use of metadata, i.e., the data used to describe documents, resources, and other material by describing authors, subject, title date of publication, etc. The Semantic Web metadata formats are characterized as encoding “semantic” information about documents and resources on the Web. Unfortunately for this project, there is a three-way systematic ambiguity in the sense of “semantic” that is intended. The following senses of semantics can be distinguished:

1. *Information retrieval (IR)*. Semantics in IR is focused on the concept of *relevance*, which is generally defined as an aboutness relation that holds of a document and its content. This aboutness relation is generally represented by metadata and/or keywords, whether from a controlled vocabulary or extracted from full text. Document semantics associates a document with its content, with other documents with similar content, and with queries.
2. *Formal logic*. Semantics in formal logic is defined in terms of the *truth conditions* of an expression, i.e., the conditions that need to hold in the world for that expression to be true. Semantics in this sense concerns the propositional content of expressions, their composition from constituent parts of the expression, and the inferences that can be licensed from them logically.
3. *Linguistics*. Semantics in linguistics is concerned with the meanings of natural language most generally. In addition to aboutness, compositionality, and inference, linguistic semantics recognizes and studies the dependence of linguistic meaning on the external social context and the complex historical dialectic between literal meaning and pragmatic inference.

Different technologies developed for the Semantic Web primarily address the first two senses of semantics. The RDF metadata interchange language and its associated syntax RDF/XML most directly address document semantics in the IR sense. They achieve the function of associating documents or resources with metadata labels that are intended to reflect their relevance to queries and other documents. The metadata definition languages RDFS and OWL, as well as the processors defined for them, most directly address the logical sense of semantics, by defining the inferences that are licensed when particular metadata elements are present. As yet, no Semantic Web technology directly addresses the broader linguistic semantics of documents and/or metadata. The Web 2.0 system feature that comes closest to this is “folksonomy” tagging, which is the provision for allowing users to apply uncontrolled metadata items that are not formally differentiated. According to proponents, tagging allows users’ own semantics to “emerge” from the contexts in which they apply tags, making formal controlled vocabularies unnecessary.

However, this latter perspective owes more to complex systems than linguistics, and it does not fully engage with the social processes involved in the informal standardization and norming in language. In the complex systems model of emergent behavior, individuals are more or less equivalent agents, and complex collective behaviors are a consequence of these simple actors conforming to simple rules. Linguists would typically recognize the actors’ behavior as likely to be heterogeneous and anything but simple. Different people may have different meanings for

the same terms, or different meanings for a term in different contexts. Complex self-referential deixis can be involved (e.g., the tag “to read” implicitly references the person who applies the tag), as can cultural, political, and other interpretive frames. People enter into the tagging activity with different levels of knowledge, expertise, power, etc., and consequently are not equivalent actors in the construction of a consensus semantics. Hence, the semantics of a large group of people tagging resources on, e.g., a social book-marking site such as del.icio.us is more likely to involve an averaging or bleaching of individual differences and a predominance of hegemonic meanings than the emergence of complexity envisioned in the “emergent semantics” perspective.

A linguistic perspective on the Semantic Web project would emphasize the social and usage-based aspects of metadata. In terms of the already existing technologies, we could ask to what extent particular RDF vocabularies are used according to their defined intent, or whether their application to particular resources and documents has altered their meaning in some way. For example, the Dublin Core metadata set is widely used in a range of applications, including the import/export of user profiles on social network/journal sites such as LiveJournal. In particular, the dc:title item is used to indicate text labels for a broad range of things, including personal interests, community names, etc., most of which were not envisioned in the original Dublin Core standard. It thus appears that the range of usage available for dc:title has been extended in a way much like the historical extension of word meanings. Note that this has consequences for logical semantics, since the extension affects the inferences one can make based on the content of dc:title. In terms of design recommendations, a linguistic perspective on document semantics would instruct us to anticipate that meanings may depend in complex ways on social and historical context, and to avoid attempting to codify semantics rigidly. A useful area to explore for technical development would be the design of mechanisms that permit meaning to be negotiated on the fly, much as humans are able to negotiate meaning, through comprehension checks and the application of pragmatic inference.

Language Categorization

Another area of linguistics that has special relevance for the Information Sciences is the area of language classification. As mentioned above, the primary classifications used by linguists are historical “genetic” classifications. These classifications do not necessarily reflect other important aspects of a language’s ethno-historical background that might be relevant for other purposes, such as its writing system, literary heritage, or available technical vocabulary. A recent development in language classification is the 2006 adoption of a new standard under the auspices of the International Standards Organization

(ISO), ISO 639-3, managed under the registration authority of SIL International, a nongovernmental organization that performs consulting services on linguistic issues, and which is closely associated with various Christian missionary organizations. ISO 639-3 supplements the older ISO 639-1 standard, which provides 180 two-letter codes, and the ISO 639-2 standard, which provides approximately 400 three-letter codes. In contrast, ISO 639-3 has three-letter codes for 7863 known languages. The importance of ISO 639 comes from its targeted adoption in libraries and archives (where ISO 639-2 is now widely used) and Web technologies (where ISO 639-1 is more commonly used) as a means of identifying languages by using fixed codes, where names and other identifications can be ambiguous. The rationale for the revised ISO 639-3 standard is that neither earlier standard can adequately represent the complete range of human languages that might be used either in writing or in spoken media.

The codes in the new standard represent a superset of the earlier 639-2 codes. The largest change in the standard is the addition of more than 7000 languages, based on the entries of the *Ethnologue*,^[29] a publication of SIL International cataloging the world's languages, their locations, linguistic characteristics, and speaker populations. While the *Ethnologue* is generally regarded as the most respected and complete authority of this type, its selection as the basis of ISO 639-3 is not neutral with regard to certain linguistic issues. Hence, adoption of ISO 639-3 in libraries or other contexts where languages need to be differentiated implies tacit acceptance of the *Ethnologue*'s sometimes controversial language classifications.

At a most basic level, there appears to be little agreement among linguists on the number of living human languages. Estimates vary from a low of 2000 to a high of 8000 or more, and the *Ethnologue* is positioned toward the high end of this range. A related issue concerns the identification of distinct languages where speakers of those language varieties would not necessarily recognize them as distinct; in these contexts, *Ethnologue* classifications (and by extension ISO 639-3) tend to be language “splitters,” based on a criterion of mutual intelligibility. One case that exemplifies this is that of Quiché (Mayan) in Guatemala, where the *Ethnologue*, and by extension ISO 639-3, counts 69 distinct languages. Quiché speakers on the other hand tend to prefer recognition of a single Quiché language, fearing that recognizing multiple Quichéan languages would fragment their cultural and political identity. A similar situation holds for various Germanic varieties in Germany (e.g., Bavarian, Swabian), which most speakers would probably classify as dialects of German, for reasons of national identification, even though these are linguistically closer to Allemanic and Swiss varieties spoken nearby. Splitting language identities in these and other circumstances is politically charged, hence the maintenance of the ISO 639-3 technical standard is one with a complex political dimension.

In some notable cases, identification goes in the other direction (lumpers), such as in the case of Mandarin Chinese, whose reported 800 million native speakers is a statistical anomaly, being many times larger than the typical language population of 10,000–50,000 native speakers, and several times larger than the nearest large language. This number probably over-reports the native Mandarin-speaking population by insufficiently distinguishing related varieties of Chinese.

The fundamental problem that remains to be addressed in the maintenance of the standard is the potentially inconsistent application of criteria that establish a speech variety as a language, dialect, or other speech variety. In the past the process of modifying language codes in the *Ethnologue* has been treated as a largely editorial one, whose consequences mainly affected SIL International's book-keeping on its language development projects. Maintenance of ISO 639-3, however, is a formal standards process whose authority is established by international treaties among participating governments, and which is required to be open to submissions from a range of different interests. In the 2007 changes to ISO 639-3, 395 changes were approved, including 76 “retired” codes, 59 new language codes, and 176 updates (meaning name changes, etc.), representing a 5% change in the available codes. It is unclear whether the reasons for addition/retirement of ISO 639-3 codes represent the application of the same linguistic criteria in all cases.

Language in Information Policy

In recent years, language has emerged as an important area in information policy, for a number of reasons. One fairly salient reason is the continued management of the Domain Name System (DNS), under which numerical Internet Protocol addresses are associated with natural language mnemonic identifiers, by the Internet Corporation for Assigned Names and Numbers (ICANN), under contract from the U.S. Commerce Department. This system uses a 7-bit ASCII encoding for names of Internet hosts that natively supports only U.S. English names. Since native-language naming is a central touchstone for Internet governance, numerous governmental and non-governmental organizations pressured ICANN for a number of years to adopt some form of multilingual standard for domain names. This pressure culminated at the United Nations World Summit for the Information Society in Tunis, 2005, where ICANN agreed in principle to open Internet governance to participation by a wider range of organizations, and to consider expansion of the DNS. In 2006, the formal adoption by ICANN of Punycode, a 7-bit variable-width encoding of the Unicode character set, permitted domain name registrars in some domains to begin offering domain names in a broader range of languages, known as Internationalized Domain Names (IDNs). These policies were further expanded in 2008.

The basic function of the DNS is much the same as that of Semantic Web metadata: to disambiguate the reference of certain mnemonic expressions used in an electronic information system. These mnemonics are intended as a human convenience: they are not required for the Internet itself to function, and their only value is that they might mean something to people. Peculiarly, at least from the perspective of human languages, both DNS identifiers and Semantic Web metadata are required to be globally unique, something that is never the case in natural languages. While this requirement is obviously instituted for the convenience of computer processing, in reality, global uniqueness is a fiction that can only be maintained under the closed-world assumption that everything worth reasoning about can be enumerated and contained within one fixed system. This assumption of a Platonic ideal universe rapidly becomes difficult to implement when it is transferred to a shared information network with inputs from multiple sources in multiple social contexts. It also becomes politically oppressive when taken to its logical conclusion, forcing everyone and everything to access the reference of any Internet host or any ordinary expression through a centralized authority. While national governments and other groups often engage in formal efforts to standardize natural languages, such efforts typically have little impact on the native-speaking public. Ordinary language use, a fundamental human experience, and arguably a fundamental human right,^[30] needs to be responsive to the changing context and experience of speakers' everyday circumstances. The failure of the DNS to naturally accommodate naming in languages other than English, and the requirement that the reference of names be globally fixed for the system to function, are thus failures of the system design to properly address its human interface goals.

What is at stake in both the DNS and the Semantic Web is actually the extension of property rights to language (the "commodification" of language), a much broader trend encompassing trademarks, copyrights, and other forms of "intellectual property." Requiring global uniqueness creates a property system wherein prospectors can claim potentially valuable territory, and develop it to extract rents or turn a profit, as in the case of certain two-letter domain names (actually ISO 3166-1 country codes), such as .tv (Tuvalu, used for "television"), .ad (Andorra, used for "advertising"), and .cd (Democratic Republic of the Congo, used for "compact disc"). While something like this property system has arguably existed for some time in the case of copyright, trademark, and other forms of intellectual property, the manifestation and interpretation of such intellectual property systems is not the same across cultures,^[31] and such an extensive property system has never been created before for reference, a far more basic linguistic function than, e.g., literature or invention. A linguistic agenda for research and development in the DNS would examine the manner in which DNS entries

are actually used, the purposes to which they are put, and the dynamic nature of referential meaning in the context of information technology use.

Computer-Mediated Communication

Another area of the study of information in which linguistic approaches have been actively adopted is computer-mediated communication (CMC). Currently, the primary use of the Internet remains human-to-human communication over computer media, most of which involve text. Consequently, most uses of CMC make heavy use of written language, and hence linguistic means of analyzing text and language are relevant to the study of CMC. However, studies of CMC have only slowly gathered acceptance within the field of linguistics, mainly because of the primary status accorded to spoken over written communication. Since many of the initial questions around CMC concerned differences between speaking and writing, or features of spoken language appearing in written CMC, linguists have tended to neglect or disregard linguistic studies of CMC as being less than central to the concerns of the field. At the same time, it is becoming clearer to many researchers that some forms of CMC, such as instant messaging and short-messaging (SMS) via cell phones, communication on Weblogs, and social networking sites, are developing into primary modes of interaction for some purposes. As this awareness develops, and as the full range of linguistic phenomena relevant to CMC become recognized, study of CMC is gradually gaining acceptance within linguistics.

Studies of CMC from a linguistic perspective have focused on a broad range of phenomena, of which four general categories might be recognized: register and genre effects, interactional dynamics, cognitive processing constraints, and language contact phenomena. The earliest CMC studies, e.g.,^[32] generally address register and genre effects; these studies tend to consider CMC types such as e-mail, chat, and discussion boards and ask how they differ from writing and/or speech, noting in particular a divergence between informal written CMC modes such as e-mail or chat and that of standard written language. Later studies in this vein^[33] have tended to interpret such observations from the perspective of genre theory, rather than as deterministic effects of the medium. Different CMC modes also tend to have different kinds of constraints, e.g., on message length, and may be favored by different communities of users. Consequently there are different structural adaptations that are found in different modes, such as chat (which is exchanged synchronously, when the users are logged in at the same time) and e-mail (which is exchanged asynchronously). Even superficially similar communication modes, such as chat within MUDs or MOOs (a kind of text-based multiplayer game environment) and Internet Relay Chat (a general real-time chat system) can show sharply different structural adaptations

of language, because of the different communities of users that frequent those systems.^[34]

Within the area of interactional dynamics, probably the first area to receive extensive study was that of gender,^[35] although studies of flaming, trolling, and other antisocial behaviors followed. Other aspects of interactional dynamics, such as turn-taking in various CMC modes, the coherence of extended interactions, and social network effects on the distribution of languages or linguistic variants, have also been studied. Building on much of this work is a body of design and experimental work, in which various parameters of CMC are manipulated. In the experimental tradition, the effects of these manipulations are studied in controlled experiments to identify medium effects on task performance in different contexts.

Finally, a group of studies has attempted to address an issue unique to the international context of the Internet, namely the effects of language contact among speakers of different languages using CMC. This contact is perhaps less obvious to speakers of English than it is to speakers of almost any other language, who are typically confronted with English in most of their online activities. At times, speakers of other languages have responded to the perceived dominance of English, e.g., in the case of Brazilian members of the social networking service Orkut who visibly used their Portuguese language in public fora as a political statement, much to the consternation of some English-speaking members. Most studies in this area are individual case studies, often of small-scale settings.^[36] There have been a few attempts to survey languages used on the Internet more generally,^[37] but this has not been done yet in any comprehensive way.

CONCLUSION

Linguistics is a discipline that inhabits an interdisciplinary problem-space with many points of intersection, realized and unrealized, with the field of information studies. Its primary mode of investigation is structural analysis, although the modern practice of linguistics uses methods informed by many other disciplines. In addition, linguistics has broad applicability to information studies, where it can contribute insights that unite the contextual aspects of information use (e.g., cognitive, social, and cultural context) with concerns about the structural manifestations of information.

Linked Data

Jeremy Myntti

J. Willard Marriott Library, Salt Lake City, Utah, U.S.A.

Abstract

In the evolving world of data on the World Wide Web, there are many standards that are used to provide better data with more context and meaning in the Semantic Web. Linked Data standards must be followed in order to fully utilize Semantic Web technologies by creating a web of data that can be interpreted by both human and machine. This entry provides an overview of what Linked Data means and the basic best practices for implementing Linked Data, as well as a quick survey of how Linked Data is being used in libraries.

INTRODUCTION

Simply put, Linked Data refers to publishing data on the web that links to other data on the web. In the traditional World Wide Web, documents were linked to other documents, but individual pieces of data were not linked to anything. Linked Data is the mechanism that is used to create links between individual pieces of data in order to provide richer information about things and concepts.

This entry will give an overview of how the Web environment is evolving to allow for the linkage of pieces of data rather than only documents, the basic principles that should be followed to create Linked Data, the benefits of implementing Linked Data, and the ways that Linked Data can be created. It will conclude with a brief overview of some Linked Data projects underway in libraries.

OVERVIEW OF LINKED DATA

Tim Berners-Lee first coined the phrase “Linked Data” in 2006 when talking about the design of the Semantic Web. According to Berners-Lee, “The Semantic Web isn’t just about putting data on the web. It is about making links, so that a person or machine can explore the web of data. With Linked Data, when you have some of it, you can find other, related, data.”^[1] He has also been quoted from the Library of Congress in an overview of the BIBFRAME project as saying:^[2]

The realization [behind creation of the Internet] was, “It isn’t the cables, it is the computers which are interesting.” The Net was designed to allow the computers to be seen without having to see the cables. The [World Wide Web] increases the power we have as users again. The realization was “It isn’t the computers, but the documents which are interesting.” Now you could browse around a sea of documents without having to worry about which computer they were stored on. Now, people are making another

mental move. There is realization now, “It’s not the documents, it is the things they are about which are important.”

While they are closely related, Linked Data and the Semantic Web are two separate ideas. To distinguish between the two ideas, it has been said that the “Semantic Web is defined as a ‘web of data’; a web created for computers linking data that is structured in such a fashion that computers do most of the linking.”^[3] Linked Data is the set of standards and technologies that are used to build the relationships between individual pieces of data. Data linked in this fashion can be described as “structured, reusable, machine-actionable, and interrelated.”^[4]

PRINCIPLES OF LINKED DATA

For many years, data has been published on the web in a human-readable format. Linked Data builds upon this structure by publishing data on the web according to a set of standards that make the data both readable by humans and also formatted in a standardized way for a computer to interpret the meaning and context of the data. This makes it possible for both humans and computers to identify related data on other sites that can provide a wealth of information about a thing or an idea, as well as to disambiguate between data that may share the same name.

Tim Berners-Lee has said that there are four principles that must be followed in order to create Linked Data. These principles are as follows:^[1]

- Use URIs (Uniform Resource Identifiers) as names for things.
- Use HTTP (Hypertext Transfer Protocol) URIs so that people can look up those names.
- “When someone looks up a URI, provide useful information, using the standards (RDF*, SPARQL).”
- “Include links to other URIs, so that they can discover more things.”

All four of these principles need to be followed in order to provide true Linked Data. A majority of information on the web currently follows some of these principles, but not all of them. These principles build upon the general architecture of the World Wide Web by taking web documents and marking them up using common standards in order to provide structured data that is open and reusable by others as well as linked to data housed on other websites.^[5]

Use URIs as Names for Things

The first principle of Linked Data is to use a URI to identify individual “things.” These URIs are different from URIs that are used to identify documents on the Web since they represent an individual piece of data rather than the location of a full document. Linked Data URIs can not only be used to identify real objects, such as a person, place, or thing, but they can also be used to identify a concept or an idea. Without a unique URI to identify something, it can be difficult for humans and nearly impossible for computers to always disambiguate ideas correctly.

A URI consists of a string of characters identifying a domain name and the unique file path of the item being described. A URI identifies a reference to a resource rather than providing a file name or location of a resource. The location of a resource is denoted by a URL, or Universal Resource Locator, which links to a specific document on the web.

HTTP URIs

Users must be able to look up the data represented by a URI through the HTTP. This protocol is the foundation for communication via the World Wide Web. Other forms of unique identifiers on the Web are to be avoided if they cannot be looked up via HTTP, such as a URN (Uniform Resource Name) or DOI (Digital Object Identifier). There are two main reasons why HTTP URIs are necessary for Linked Data. These are as follows:^[5]

1. “They provide a simple way to create globally unique names in a decentralized fashion, as every owner of a domain name, or delegate of a domain name owner, may create new URI references.”
2. “They serve not just as a name but also as a means of accessing information describing the identified entity.”

Since HTTP URIs can be accessed by both humans and computers, a method of content negotiation is used for the web server to return either an HTML-coded document for a person to read or RDF (Resource Description Framework) data for the computer to interpret. According to the World Wide Web Consortium (W3C), HTTP content negotiation means that the web server is able to make a decision based upon the information available and the

Web Client’s preferences in order to deliver the type information needed by the user in order to make the data human or computer accessible.^[6]

Use Linked Data Standards

The primary standard used to encode Linked Data is RDF in its various forms (e.g., RDF/XML, N3 Triples, Turtle, JSON-LD). These Linked Data sets are then queried through SPARQL (SPARQL Protocol and RDF Query Language). The building block of RDF is the triple, a set of three URIs or literal values denoting a property held by the resource being described. The three parts of a Linked Data or RDF triple can be defined as follows:

1. Subject—a URI identifying the resource to be described
2. Predicate—a URI from a specific domain or vocabulary creating a relationship between the subject and object
3. Object—a URI or literal value (e.g., string, number, date) describing the subject

There are two main types of triples that can be created with this structure: a literal triple or a linked triple. A literal triple will contain a data string, number, or date as the object describing the subject, such as describing the name of a person or the date of an event. A linked triple consists of three URI references relating the subject URI to the object URI through a predicate URI. The URIs for the subject and object can either be in the same domain or different domains. Links to different domains are used in a triple to link multiple websites, which then creates the web of data. A single triple describes one aspect of a resource and many triples linked together describe multiple aspects of a resource. For example, if the object being described is a book, there can be multiple triples linked to the resource describing its title, publishing information, extent, creators, etc.

The information that is provided when a URI is looked up needs to be further information and context in order to disambiguate between different concepts with the same name that can be interpreted by both human and computer. For instance, if the thing that is being represented by a URI is “Mercury,” there needs to be other data retrievable from the URI in order to know whether the item is the chemical element, the planet, the automobile, or one of the many corporate bodies with that name.

When data is structured according to the RDF standard, it becomes possible to query that data using SPARQL. When SPARQL was first implemented by the W3C in 2008, it was “designed for use at the scale of the Web, and thus enables queries over distributed data sources, independent of format.”^[7] This would lead to providing richer results that would cost less since a single query could be used to search multiple data stores.

Link to Other URIs

The final principle of Linked Data is to link to URIs from different domains in order to connect the full web of data. Data is not considered true Linked Data until it has been linked to sites outside of the current domain or web server. These external links are generally used as the predicate and object of an RDF triple. Links like this can be one of three types:^[5]

1. “Relationship Links point at related things in other data sources, for instance, other people, places or genes. For example, relationship links enable people to point to background information about the place they live, or to bibliographic data about the publications they have written.”
2. “Identity Links point at URI aliases used by other data sources to identify the same real-world object or abstract concept. Identity links enable clients to retrieve further descriptions about an entity from other data sources. Identity links have an important social function as they enable different views of the world to be expressed on the Web of Data.”
3. “Vocabulary Links point from data to the definitions of the vocabulary terms that are used to represent the data, as well as from these definitions to the definitions of related terms in other vocabularies. Vocabulary links make data self-descriptive and enable Linked Data applications to understand and integrate data across vocabularies.”

BENEFITS OF LINKED DATA

There are many formats that can be used to publish data on the Web. Heath and Bizer say that some of the benefits of using Linked Data for publishing on the Web include the following:^[5]

- “A unifying data model. Linked Data relies on RDF as a single, unifying data model. By providing for the globally unique identification of entities and by allowing different schemata to be used in parallel to represent data, the RDF data model has been especially designed for the use case of global data sharing. In contrast, the other methods for publishing data on the Web rely on a wide variety of different data models, and the resulting heterogeneity needs to be bridged in the integration process.”
- “A standardized data access mechanism. Linked Data commits itself to a specific pattern of using the HTTP protocol. This agreement allows data sources to be accessed using generic data browsers and enables the complete data space to be crawled by search engines. In contrast, Web APIs are accessed using different proprietary interfaces.”

- “Hyperlink-based data discovery. By using URIs as global identifiers for entities, Linked Data allows hyperlinks to be set between entities in different data sources. These data links connect all Linked Data into a single global data space and enable Linked Data applications to discover new data sources at run-time. In contrast, Web APIs as well as data dumps in proprietary formats remain isolated data islands.”
- “Self-descriptive data. Linked Data eases the integration of data from different sources by relying on shared vocabularies, making the definitions of these vocabularies [retrievable] and by allowing terms from different vocabularies to be connected to each other by vocabulary links.”

Other benefits as described by Lampert and Southwick are as follows:^[8]

- “An opportunity to connect distributed sets of structured data about ‘things’.”
- “The more structured the data are, the more actions that can be performed on the data.”
- “Open data relieves the frustration of accessing data that cannot be used due to formatting or restriction in silos [...] and it allows the data to not only be discovered on the open Web, it can be delivered for use, reuse, or [...] to help bridge applications and systems.”
- Data are reusable and break out of their silos.

PUBLISHING LINKED DATA

In order for data providers to understand if they are providing true Linked Data, Tim Berners-Lee created a five star model that can be followed:

- 1 star—“Available on the web (whatever format) but with an open license, to be Open Data”
- 2 stars—“Available as machine-readable structured data (e.g. excel instead of image scan of a table)”
- 3 stars—“As^[2] plus non-proprietary format (e.g., CSV instead of excel)”
- 4 stars—“All the above plus, Use open standards from W3C (RDF and SPARQL) to identify things, so that people can point at your stuff”
- 5 stars—“All the above, plus: Link your data to other people’s data to provide context”^[1]

Another way that this five star data model for evaluating data can be understood is as follows:

- 1 star—Data structure
- 2 stars—Licensing
- 3 stars—Format
- 4 stars—Identifiers
- 5 stars—Data linking^[9]

Many different methods have been discussed to create Linked Data. A simple process can be described in three steps:^[10]

1. "Assign URIs to the entities described by the data set and provide for dereferencing these URIs over the HTTP protocol into RDF representations."
2. "Set RDF links to other data sources on the Web, so that clients can navigate the Web of Data as a whole by following RDF links."
3. "Provide metadata about published data, so that clients can assess the quality of published data and choose between different means of access."

Different checklists for publishing Linked Data have also been created. Some questions that must be answered in order to create Linked Data include the following:^[5]

- "Does your data set links to other data sets?"
- "Do you provide provenance metadata?"
- "Do you provide licensing metadata?"
- "Do you use terms from widely deployed vocabularies?"
- "Are the URIs of proprietary vocabulary terms dereferenceable?"
- "Do you map proprietary vocabulary terms to other vocabularies?"
- "Do you provide data set-level metadata?"
- "Do you refer to additional access methods?"

If the answer to all of these questions is "yes," then the data has been created according to all of the Linked Data standards. If one or more of the answers is no, then things must be corrected in order to make the data truly linked.

Creating a Linked Data Application

In order to create a basic Linked Data application for use on a website, there are a few steps that must be completed. First, data sources that contain relevant data about the items to be described need to be identified in order to retrieve useful information to represent the items. Once this data is identified from other sources, it should be downloaded into a local Linked Data RDF store so that it can be used and consumed on a local level. The final step is to query and retrieve this information when needed from the local data store so that it can be displayed for the users of the website.

While that can be a relatively simple way to implement a Linked Data application, the data in the RDF store will need to be updated and refreshed periodically in order to maintain the completeness and accuracy of the data. This can be achieved by crawling the data from the external sources on a regular basis to find new or changed data or an "on-the-fly dereferencing pattern" can be used to dereference URIs at the same time that the Linked Data application requests the information. The latter method will provide the most up-to-

date information, but it could also be a slower method since URIs from many different domains would need to be queried when the user requests the data.^[5]

LIBRARY LINKED DATA

Some Linked Data initiatives that are underway in libraries worldwide as of this writing include the Library of Congress' Bibliographic Framework Initiative (BIBFRAME – <http://bibframe.org/>) and the European Linked Open Data Project (<http://pro.europeana.eu/linked-open-data>). Both of these library-centric initiatives are working to take existing library data and transform it into a Linked Data model that will help library data to be more shareable and accessible on the open web.

The Library of Congress started the BIBFRAME project "to re-envision and, in the long run, implement a new bibliographic environment for libraries that makes 'the network' central and makes interconnectedness commonplace."^[2] This model is being explored "to provide a pattern for modeling both future resources and bibliographic assets traditionally encoded in MARC 21."^[2] This is said to be achieved by working toward two objectives: "1) enable far more integration of existing bibliographic resources and 2) create a roadmap for moving forward toward refinement, redevelopment or development of alternative approaches."^[2]

In addition to the emergence of Linked Data, there is also the movement toward Linked Open Data in libraries, archives, and museums. While there can be restrictions on the use of Linked Data, Linked Open Data is data created with an open license that can be downloaded and repurposed, with or without attribution, depending on the licensing terms in use by the data creator.

The European Linked Open Data Project has been a work in progress for several years, with the first datasets being released as Linked Open Data in February 2012. In a 2011 paper presented at the International Conference on Dublin Core and metadata applications, it was said that.^[11]

With data.europeana.eu we are making a first version of the Europeana metadata set available as Linked Open Data. It includes data from those providers who have opted for their data to be published in the public domain. Anyone can now obtain descriptive metadata about Europeana resources by downloading the dumps, dereferencing HTTP URIs, or executing SPARQL queries against a dataset that follows the Europeana Data Model (EDM). The tools and scripts we developed for this purpose are open source and can freely be re-used or extended by others.

CONCLUSION

Linked Data has the potential to break down data silos by creating methods and best practices for providing data

from a host of different sources to users of websites using Linked Data. This will allow for sharing common metadata standards, reutilizing existing controlled vocabularies, and the integration of additional sources of data to a website's existing data source.

With more cultural heritage institutions starting to experiment with Linked Data, metadata in libraries, archives, and museums could vastly change in the future. The vast amount of data that libraries hold can be a great addition to the Linked Data environment, making it possible for other institutions and websites to reuse library data in many different ways.

Lithuania: Libraries and Librarianship

Elena Maceviciūtė

Faculty of Communication, Vilnius University, Vilnius, Lithuania, and Swedish School of Library and Information Science, University of Borås, Borås, Sweden

Abstract

The entry is devoted to the present situation (2001–2006) of libraries in Lithuania, a Baltic state that regained independence from the Soviet Union in 1990. The author describes general features of the historical and modern context that formed and influenced the Lithuanian library sector and presents the characteristic features, achievements, and problems of the public library network, academic and research libraries, and networks of school and special libraries. The institutions educating library and information specialists and conducting research and the professional organizations of librarians are introduced. The entry is a general introduction to modern Lithuanian libraries.

INTRODUCTION

The Republic of Lithuania has a complex political history ranging from a medieval Polish-Lithuanian State to a neglected, nineteenth century province of the Russian Empire. Its cultural history and heritage are equally complex. Its modern cultural and information institutions are the result of this history and of the mixed traditions inherited from different peoples and historical periods.

This entry provides a broad introduction to libraries in Lithuania since 1990 when the independence of the country was restored. These years were rich in events ranging from the Soviet Union blockade (lasted 74 days from April 20 to July 2, 1990, when Soviet Union stopped all provision of oil, fuel and raw materials demanding to revoke the Act of the Re-Establishment of the State of Lithuania from March 11, 1990) to unprecedented economic growth and a changing political and cultural scene.

One of the goals that unites different types of libraries is providing information services to various segments of Lithuanian society and ensuring wide national and international access to information and cultural materials for the sake of the progress and development of a democratic society. Another goal is preserving and making sense of the rich cultural heritage during a period of intensive change in modern Lithuanian society. The range of information and cultural institutions pursuing these goals is broad, but space limitations do not allow us to introduce them all. Therefore, we will confine our discussion to the library sector, leaving out other providers of information products and services.

Definitions

Lithuania—(Lithuanian: *Lietuva*), officially the *Republic of Lithuania* (Lithuanian: *Lietuvos Respublika*), is a northern European country situated along the south-eastern

shore of the Baltic Sea, sharing borders with Latvia to the north, Belarus to the southeast, and Poland, and the Russian exclave of the Kaliningrad Oblast (county) to the southwest (see Fig. 1). It has a population of 3,575,439 (2007 estimate); 83.6% are ethnic Lithuanians, with minority groups that include Poles, Russians, and Belarusians.^[1]

Library system. The totality of networks of various library types that perform a variety of functions in service of the same local or national community and are governed by unified legislative, economic, and organizational principles.

Library network. A group of libraries that perform the same social functions for a typical group of users, based on the same principles and supported by a professional guidance center.

Library sector. The whole library sector can be treated as a broad social system based on a common legislative foundation, consisting of several interwoven organizational networks pursuing specific but complementary goals and using educational, professional, technological, and research resources provided by other, closely associated, societal systems. The entry will treat all of these components at an introductory level providing a snapshot of the present situation.

HISTORICAL CONTEXT

Discussing East European nations in their historical context is complicated by the changing political, military, economic and ethnic composition of the region. The Lithuanian case is further complicated because ethnic Lithuania has two parts: Lithuania Minor (the left bank of the river Nemunas that was mainly under the control of German states) and Great Lithuania. This division is important for cultural history, because Lithuania Minor played a huge role in the development of Lithuanian

Fig. 1 Map of Lithuania.

culture, literacy, book publishing, and education. Lithuanian history may be divided into the following three periods:

- *Fourteenth to eighteenth century*—formation of the state, its expansion, and decline.
- *End of eighteenth to start of twentieth century*—partition of the state and survival under Tsarist Russia, rise of a national movement.
- *Twentieth to twenty-first century* (since 1918)—first independence period; Soviet period; second independence period.

Each of these periods can also be characterized by specific cultural features and developments in the media, book and library history.

The first period (fourteenth to eighteenth century) is characterized by the formation of the Lithuanian super-state, the late adoption of Christianity at the end of the fourteenth century, the Union with Poland and military conflict in the West (with the Teutonic Order), East (with Russia), North (with Sweden), and South (with Turkey). The militarization of the state and the geopolitical situation inhibited cultural development. However, the first libraries (mainly in monasteries) were established during this period, the first private book collections were built by Lithuanian aristocracy and rulers and the first printing houses were established. Lithuanian script was created and the first Lithuanian book was published in 1547 in Lithuania Minor; subsequently, publishing in the

Lithuanian language expanded. The first library for a Lithuanian college at Prague University was created in 1397. Vilnius University Library began in 1579 as a Library of the Jesuit Academy.^[2] The eighteenth century saw the development of the libraries of educational institutions and churches and the rise of the first ideas of public access to libraries.

During the second period (eighteenth to twentieth century) the Polish-Lithuanian state, including the Grand Duchy of Lithuania, ceased to exist and was divided among Tsarist Russia, Prussia and the Austro-Hungarian empire (last division in 1795). The largest part of ethnic Lithuania belonged to Tsarist Russia, and Lithuania Minor—to Prussia. Lithuanian libraries suffered great losses together along with the rest of Lithuanian culture. However, there were also developments significant for libraries. Vilnius University played a significant role in the education of Lithuanian authors and scholars writing in different languages, but also in Lithuanian. The first scholarly works related to library work and bibliography were created by a number of scholars of Vilnius University (Groddeck, Lelewel, Bohatkiewicz). The first course in bibliography was taught at Vilnius University in 1828–1831 by Bohatkiewicz. In 1831, after a insurrection against Tsarist rule, Vilnius University was closed, so its library ceased to exist as a university library.

From 1864 to 1904, Lithuanian script was banned, affecting the development of literature, education, publishing, book trade, and other spheres of life. During this period, the role of Lithuania Minor increased, because it

served as a source of literature in the Lithuanian language for Great Lithuania. Literature produced there and in other regions was smuggled in and gave rise to a cultural phenomena known as “book carrying.” The first communal library was established in Šiauliai (1850–1864); Vilnius Public Library was opened in 1867. Once the ban was lifted, the first legal Lithuanian libraries began to appear in parishes, educational institutions, and societies. Vrublevskis Public Library was opened in 1912 (later included in the Library of the Academy of Science), and the first bibliographies of Lithuanian publications appeared.

The Baltic states emerged from the political turmoil caused by the First World War. The first independence period (1918–1944) was most important for the development of libraries. The National Library of Lithuania (NLL) was founded in 1919 in Kaunas, then the provisional capital of Lithuania, as the Central State Library of Lithuania. The Bibliographic Institute was established at Kaunas University Library and started publishing the national bibliography (1928–1944). The system of public libraries was created, the first courses for librarians were organized and the Lithuanian Librarians’ Association was established in 1931. The Law on State Public Libraries was adopted in 1936.

Soviet rule, from 1940 and after World War II, distorted the role of libraries and diverted their natural development to a different direction. Collections were destroyed and their renewal controlled, the functions of libraries changed and the Lithuanian Librarians’ Association, which has been closed by the Germans, was not recreated until 1989. The libraries mainly served as ideological institutions; however, the actual needs of life demanded certain services. The Soviet period saw the expansion of mass libraries and the creation of the State System of Information Support for industry and other branches of the economy. The Book Chamber, established in 1945, took over compiling the current state bibliography and started work on a retrospective national bibliography. The State Republican Library performed the role of the main support center for all libraries and functioned as a national library. In 1949, it started the journal *Bibliotekų darbas* (Library Work) (changed title to *Tarp knygų—In the World of Books*—in 1991). In 1949, Vilnius University admitted the first students to the program of library science and bibliography. Despite being under tight ideological control, Lithuanian librarians managed to accomplish significant work in preserving the cultural heritage. Gudauskas^[3] has provided a more detailed picture of the history of Lithuanian libraries.

Modern Context

The second independence era, which began in 1990, is as controversial from the point of view of library development as the Soviet period. Rather than having an ideological press, market forces, the problems of a young

developing state, and the advent of new information and communication technologies influenced the library system. The factors that have had the greatest impact on library development include

- *A changing market for books and information products*: almost 500 publishers produce more than 4200 titles a year (p. 4–5);^[4] information production is more diverse with regard to media and form; local digital information products compete with those produced internationally.
- *A saturated and more competitive mass media and entertainment market*.
- In 2005 *computer penetration* was 31.10% and the *Internet penetration* was 15.45%,^[5] but in 2007 it was already 35.9 % (usage growth in 2000–2007, 443.0%).^[6]
- *The educational level of Lithuanian population*: 16.1% of the population had higher education; in 2006, more than 199,000 students studied at Lithuanian universities and colleges and more than 514,000 in secondary schools.^[7]
- *The policy of successive Lithuanian governments in education, culture, health, and research areas*: expenditure on education per student/pupil is one of the lowest in Europe (pp. 97–98);^[8] the same can be said about health and culture.

Since 1992, there has been strong interest in creating an Information Society. The Information Society Development Committee under the Government of Lithuania was established in 2002. It takes care of the development and implementation of information technology and communications and is also concerned with ensuring equal access to the information infrastructure by various social groups, seeking to prevent excluding anyone from participation in information society and providing access by developing the required competence. The Committee also expands the services of e-government and ensures the progress of e-democracy.^[9]

THE LIBRARY SYSTEM OF LITHUANIA

Legal Foundations

The legal foundations for access to information and the institutions providing information and ensuring its preservation in various forms are set out in the Constitution of the Republic of Lithuania. Article 25 of the Constitution guarantees that “Human beings must not be hindered from seeking, receiving and imparting information and ideas”; article 42 obliges the State to “support culture and science, and [...] take care of the protection of Lithuanian historical, artistic and cultural monuments and other culturally valuable objects.”^[10] The right to receive information and

express oneself is mainly ensured by the *Law on provision of information to the public*^[11] that deals mainly with mass media activity. Other public and private institutions are important in guaranteeing these rights and their implementation.

Since 1990 a number of laws have been passed to regulate state and private institutions concerned with the preservation of the cultural heritage and creating or delivering information products and services. Several of these laws deal with library and information service: *the Law on libraries, the Law on documents and archives, the Law on museums, and the Law on provision of information to the public*. Another category of laws regulates certain aspects of information activity and has a direct impact on libraries and other information mediators: *the Law on copyright and related rights, the Law on legal protection of personal data, and the Law on the right to get information from the state and municipal institutions and others*.

The rapid development and diffusion of information and communication technologies has stimulated the creation of laws regulating new relations and activities, e.g., *the Law on information society services, the Law on electronic communications, the Law on electronic signature*. These laws apply to libraries as providers of Internet services, creators of digital information and mediators of access to the products created by commercial and public providers.

The *Law on libraries* was adopted in 1995 and revised June 15, 2004. It establishes the system of Lithuanian libraries, relations between libraries, rules of establishment, financing and administration of libraries, building library collections and their structure and principles of service. According to the law, printed matter and any other documents must be accessible to everyone free of charge regardless of their authorship or their political and ideological orientation. A library ensures this accessibility as an institution of culture, education and information.^[12] Other laws and legal acts support this role of libraries. For example, the *Law on copyright and related rights* ensures their right to lend copyrighted works (in the case of educational and scientific libraries without remuneration) and to reproduce them for preservation purposes and for the personal needs of their users. The law also defines usage and reproduction of digital (electronic) documents through libraries. To some extent it also regulates the ownership and usage of the databases created by libraries, e.g., electronic catalogs.^[13]

Types of Libraries and Their Management

Libraries in Lithuania can be classified according to two main criteria:

1. Foundation and ownership
 - a. State libraries (founded by state institutions, local authorities, etc.). Their collections constitute state property and a joint library collection of Lithuania

based on the general information system and standards.

- b. Nongovernmental libraries (founded by private companies, political, professional, religious or other nongovernmental organizations or individuals).
2. Functions and community served
 - a. General libraries that serve the information needs of the readers of all professions, diverse levels of education, different ages and social or cultural background living within the boundaries of a certain territory. The following libraries belong to the group of general libraries:
 - (i) The National Library (the main public research library)
 - (ii) County public libraries
 - (iii) Municipal public libraries
 - b. Special libraries that satisfy the special needs of a certain served community by building specialized collections answering these needs (education, research, manufacturing, etc.)
 - (i) Special governmental libraries (serving a specialized sector, e.g., medicine, agriculture, etc.)
 - (ii) Libraries of research institutions
 - (iii) Academic libraries of higher educational institutions
 - (iv) School libraries
 - (v) Libraries of other institutions and organizations (hospital, prison, corporate, etc.)^[12]

Five libraries with exceptionally valuable collections have the status of “libraries of national significance.” They serve as consultation centers for their networks. There is a special line in the budget of the national government to finance the National Library and the libraries of national significance (except Vilnius University Library). These libraries are also officially designated to receive legal deposit copies of documents. According to this decision

“creators of the public information in 2 days after publication of the print-runs of at least 100 copies of non-secret documents (books, periodicals, microforms, audio and visual, cartographic, video, electronic, and printed in the script for blind) deliver legal deposit copies free of charge”^[14]
to

1. National Martynas Mažvydas Library of Lithuania (2 copies)
2. Vilnius University Library (1 copy)
3. The Library of the Academy of Science of Lithuania (1 copy)
4. Lithuanian Library for the Blind (1 copy of all documents for the blind including large print and audio documents)
5. Technical Library of Lithuania (1 copy of standards, technical documentation and patent documents)^[13]

Kaunas County Public Library as a second national archive also receives a legal deposit of the same type of materials that are sent to the National Library. Together with other specialized libraries (like the Lithuanian Medical Library and Lithuanian Agricultural Library) they coordinate acquisition and overall Lithuanian library collection-building in specific subjects and document types.

The Ministry of Culture of the Republic of Lithuania is authorized to regulate state administration of all libraries in Lithuania. The Library Council (currently consisting of 11 members delegated by the community of librarians and the Minister of Culture) is an advisory body, which helps to formulate the strategy of library development and library policy, define the principles of library financing, and establish the need for library education and research. The Ministry of Culture manages the NLL and the Library for the Blind and, through the state funding, directly influences the network of public libraries. Other networks of libraries are managed by other governmental departments. Among them is the Ministry of Education and Science, which is responsible for the largest network of school libraries and also takes care of academic libraries.

Martynas Mažvydas National Library of Lithuania

Since May 30, 1989, Martynas Mažvydas National Library of Lithuania has been the principal public and research library of Lithuania, according to the *Law on Libraries*. It performs all the functions of a national library:

- Serves as a national archive of all publications and ensures preservation of Lithuanian printed heritage and Lituanica (publications related to Lithuania and Lithuanians published abroad).
- Is the center of the national bibliography and publishing statistics and the center of coordination of consultation and research on library methods.
- Serves as an information center for social sciences and humanities, the center of allocation of ISBN, ISMN, and ISSN, and the center for the Lithuanian Integrated Library Information System (LIBIS).
- Serves as a Parliamentary Library (since 1991).

The NLL participates in international library activity and belongs to 11 international library associations. It has been a member of International Federation of Library Associations (IFLA) since 1992. It offers a variety of services for different groups of readers: provides the Lithuanian population with access to all its collections and seeks to widen this access through digitization; informs the public about the items in the collections through its Online Public Access Catalog (OPAC) ensures access to Lithuanian and foreign databases; promotes reading, Lithuanian culture and publications. The NLL also serves other Lithuanian libraries: collects library statistics and information about libraries in Lithuania, disseminates this information, participates and

supports the union catalog of Lithuanian libraries, creates standards for library and information work, publishes library literature and organizes courses of professional development. The performance of these tasks is ensured by 537 employees, including 389 professional librarians.^[15]

According to its annual report, in 2006 NLL had a collection of 6,912,266 physical items, 15,845 registered users, 151,116 visitors and circulated 2.2 million documents.^[15] A detailed article on Martynas Mažvydas National Library of Lithuania was published in ELIS in 2003.^[16] Some of the main functions and new projects (e.g., digitization initiatives, participation in the European Library and TEL-ME-MOR project) of this library are especially important for information policy, publishing activity, development of information services in general as well as for the other libraries in the Republic. A short overview of these functions is presented here.

Production of national bibliography and current information on publications. The NLL has performed the functions of the national bibliographic agency since 1992 when the former Book Chamber of Lithuania was reorganized into a Bibliography and Book Science Centre of the NLL. This Centre is responsible for the accumulation and preservation of the national archive of publications that appear in Lithuania: books, periodicals, printed music, cartography, audiovisual documents (since 1997), and electronic resources. This work is carried out on the basis of legal deposit. The Centre catalogs the legal deposit copies, produces current bibliographies of the documents and their component parts (*Bibliografijos žinios*—The Bibliographical News, *Knygos*—Books, *Straipsniai*—Articles, *Serialiniai leidiniai*—Serials, *Garso dokumentai*—Sound Recording Documents, *Lietuvos bibliografinės priemonės*—Lithuanian Bibliographical Tools), and compiles the database of authority records. Bibliographical records are prepared and accumulated at the National Bibliographic Data Bank, which is available on the Internet (see <http://www.libis.lt:8082/>). The legal deposit acquisitions also serve as a basis for *Lietuvos spaudos statistika* (Lithuanian Publishing Statistics). The Centre informs the public of new publications in a weekly bulletin and compiles an e-bulletin of forthcoming books. This task is accomplished as part of the activity of Cataloging in Publication (preparation of a cataloging record for forthcoming publications).

The Centre includes the Department of the Retrospective Bibliography of the National Press, which works on the bibliographies of Lithuanian publications from 1547 to 1940 irrespective of the publishing place and on publications in Lithuania irrespective of language. In relation to this work, the Department carries out extensive book research and coordinates its activities with other research libraries in Lithuania. The Retrospective Bibliography consists of several series and databases devoted to Lithuanian books, serials, articles in Lithuanian periodicals,

books in other languages published in Lithuania and small press publications.

LIBIS. The NLL started library automation work in 1985 when a special department was established to create and implement computerized library systems. In 1995 the Ministry of Culture and the government began work on the Integrated Library Information System (it was actually launched in 1996), and in 1998, the LIBIS Centre was established to ensure the implementation and development of the system in Lithuanian libraries. The system is based on original LIBIS software, which was designed by Lithuanian company *Sintagma*, and is used to create the National bibliography database and the Union Catalogue of Lithuanian Libraries — which in turn helps to integrate access to the libraries in Lithuania. The system is fully developed with all the functional modules. It is continually upgraded and the Centre helps the libraries maintain and upgrade the system regularly.

At the beginning of 2007, the LIBIS system was used by

- National Lithuanian Library
- Five out of five county libraries
- Sixty out of sixty municipal public libraries
- One university department for educational purposes
- Seven research and special libraries
- Ten museum libraries^[17]

The standards developed by the NLL ensure the interoperability of LIBIS and other computerized library systems used by Lithuanian libraries. Since 2002, the users of the libraries operating LIBIS have been issued a unified user's card that allows the user access to library services provided by all LIBIS libraries.

Library statistics. According to the change in the *Law on Libraries* from 2004 (article 8.5.14), the National Library has the function of collecting and analyzing Lithuanian library statistics, a function previously the responsibility of the Ministry of Culture. All libraries have to provide an annual statistical report of their activity for the NLL. The Library Science Centre is directly responsible for this task and uses it for monitoring the library situation, planning the assistance to public and other libraries and disseminating it to policy and decision makers as well as to the libraries. Since 2004, this material has been available electronically through the Web site of the NLL.^[15] In 2006, the paper forms of the statistical reports were changed to electronic ones and are available to the libraries through the NLL LIBIS Library Statistics module.^[18] On the basis of this data, the NLL publishes statistical reports and reference material about Lithuanian libraries.

Public libraries today

In 2006, the public library network consisted of five county public libraries (governed by the regional

Table 1 Number of libraries in Lithuania in 2001–2006.

Year	Number of libraries	Public libraries among them
2001	3677	1497
2002	3571	1405
2003	3406	1393
2004	3133	1377
2005	3020	1371
2006	2975	1372

Source: Compiled from the library statistic sources produced by the Ministry of Culture and the NLL.

administrations) and 60 municipal public libraries with 1312 branches in the towns and villages all over Lithuania (governed by local authorities). Although it is the second largest library network in the country, it reaches the widest public. The achievements and the drawbacks of the development of Lithuanian libraries can best be demonstrated by the present situation of public library system. The following Table 1 shows the number of public libraries and the total number of libraries in recent years.

The number of public libraries in the country is gradually diminishing due to the closure of small branches, integration of school and public libraries and reorganization of library networks. There are 4 public libraries per 10,000 people at present. This density is similar to that of other Baltic states and higher than in other European countries [e.g., 2.5 libraries per 10,000 people in Finland in 2006 (Calculated from Finnish Public Library Statistics at [In 2002, the government of Lithuania adopted a program of modernization of Lithuanian Libraries for 2003–2013.^{\[19\]} In 1999, Lithuanian librarians had begun preparing a long-term program for the development of libraries with the intention of changing the attitude towards libraries that had prevailed for a decade while maintaining the existing level of support for libraries \(p. 9\).^{\[20\]} The program was developed after carrying out a detailed analysis of library work in the Republic, which proved that the situation of Lithuanian libraries \(especially public libraries\) was much worse than in the average European country, even in neighboring countries, such as Latvia and Estonia. The library collection was out of date, the services poor, the funding inadequate and the possibilities to develop inhibited by inadequate premises and lack of technology. Despite the adequate number of qualified staff, the libraries could not serve the changing needs of the population. The program of modernization mainly obliges the central and local governments to create adequate conditions for library work and to ensure that the necessary material and economic basis for their activity exists. Its purpose is to develop and renew the Lithuanian](http://tilastot.kirjastot.fi/Default.aspx?pageId%4Statistics/Default&StatisticsTypeId%41&ScopeTypeId%4101&Years%42006&ScopeItemIds%41.))]. However, it seems that the number of public libraries stabilized in 2004–2006. This might be a result of the implementation of the program of modernization of libraries.</p>
</div>
<div data-bbox=)

National Library, county and municipal public libraries, and the Lithuanian Library for the Blind, i.e., a group of general libraries in the cultural sector. The following goals are to be achieved in 10 years:

- To ensure Lithuanian inhabitants the possibility of acquiring the knowledge and qualifications that would enable them to adapt to the rapidly changing conditions of life and work and to compete successfully in world markets.
- To eliminate the inequalities within information infrastructures in the cities and provinces and provide equal conditions of information technology usage to all the inhabitants for any social and public needs.
- To create in the libraries the necessary conditions for collecting, preserving and disseminating to the public the objects of national, cultural and scientific heritage and to ensure access to the library collections.

The priorities that needed greatest attention were the renovation of the library collections and acquisition of databases, a vast program for building and renovation of library buildings and intensive computerization of libraries.^[19] Another element of this vision was the development of professional competence in libraries.^[21] The program not only established goals and priorities, it also included the analysis and calculation of the required investments over 10 years and annually. The program is financed by state and local authorities as well as through different specialized programs and foundations, but it places responsibility on the librarians and library management for reaching these goals.

In addition to this overarching library development program, the following long-term projects were and still are directed towards public libraries: development of LIBIS, “Computerization of Libraries,” and “Development of Public Internet Access Points network” (funded through European structural funds and PHARE—EU assistance instrument abbreviation for original name *Poland and Hungary: Assistance for Restructuring their Economies*—especially in rural areas).

Since 2002 when the Program began, there have been gradual improvements in public libraries due to restructuring of the state capital investment with emphasis on the cultural sphere. The most visible changes are related to library buildings and computerization. Eight libraries, among them County public libraries in Klaipėda and Panevėžys (Fig. 2), municipal public libraries in Utena, Šakiai, Radviliškis, Varėna, Šilutė, and others have been built anew or renovated. Many more are undergoing reconstruction. This is a promising start, and some checks are built into the cultural policy that should prevent the cutting of financing, although librarians still fear that new priorities could reverse the present trend.

The progress in computerization of libraries can be expressed in the following figures: in 2004, computers

and the access to the Internet were available in one-third (327) of public libraries. As a result of several programs and projects, by 2006, already half of the public libraries (650) offered access to computers and, out of these, 535 were connected to the Internet.^[15] Since the beginning of 2006, according to the policy of the Ministry of Culture, access to the Internet in public libraries is to be free of charge. Before that, most of the libraries provided the use of the Internet free of charge for a certain limited time and charged a fee for additional time. Now libraries provide public access not only to the Internet, but also to an increasing number of databases: two national and 11 international in 2006 (the full list can be found on <http://www.bibliotekos.lt>).^[22] Most of the public libraries have created Web sites that provide information about the their services and have also started providing some services online (mainly access to OPACs and “Ask the librarian” service).

However, the situation is not without problems. In many libraries, especially those in cities, hardware and software are old. Eighty-one percent of librarians think that their computer literacy skills are too low, and 68%

say their skills are nonexistent. Therefore, they are not able to help or instruct readers. These problems still require serious attention and that will be addressed not only through the ongoing projects but also through a new project prepared by the Ministry of Culture, the National Library, and the Bill and Melinda Gates Foundation "Libraries for Innovation."^[23]

The changes in the areas of library collection and readers are more problematic, because their assessment is more controversial. The acquisition of materials is financed partly by the Ministry of Culture (according to the number of inhabitants in the served territory) and partly by municipality ([12], article 6). Although financing is increasing slightly, it is still significantly lower than in neighboring countries and inadequate from any point of view. The allocated resources can buy only one quarter of the new books per 1000 users recommended by IFLA. The budget is secured by law, but its reduction by the authorities on various levels is still a threat.^[24]

The increasing funding cannot stop the decrease of the library collection. The discarding of old publications is greater than acquisition of new ones. The decrease in itself is not a great danger since the collections of public libraries inherited from the Soviet period were too large and did not satisfy the new information needs of their communities. However, the inadequate funding, the increasing prices of publications, demand for the new electronic resources and the need to assess and balance the hybrid collections inhibits efforts to raise the quality of the collections (p. 3).^[25] More than 80% of collections in peripheral libraries consist of publications older than 10 years.^[24] The decreasing and poor collections of the libraries do not provide a great incentive for users, and the number of users is decreasing slowly but surely. However, the number of visitors to all libraries is growing, and the number of visitors to the public libraries is fairly stable (Fig. 3).

This could be the result of the new services and the role of the library as a cultural and public center of the

community. On the other hand, the number of users may be diminishing because of the introduction of fees for the unified library card. The introduction of a variety of fees in the libraries is indicated as a reason for the decrease of public library usage in the discussions of the issues (p. 5);^[24] (pp. 17–18).^[26] Fifty-one percent of the population use libraries. Non-users participating in one of the surveys mentioned that they do not use libraries because of poor collections (23%) and the lack of required information (7%).^[27]

A third place is an easily accessible, inexpensive, pleasant place where one feels welcomed and comfortable, meets friends and relaxes. A 2005 study of a library as a third place, conducted among users and non-users in different towns and villages, revealed that libraries are usually compared to a school or university and hospital or clinics. Thus, libraries are treated as places visited because of necessity and obligation. They are not perceived as relaxing spaces for leisure. On the other hand, some of the respondents compared a library to a church or a cathedral, thus, identifying them as spiritual and sacred spaces.^[28]

Public libraries are closely involved in the life of the communities. This involvement sets the general attitude towards libraries in the country and ensures that the next generation of users comes to the library. At present, public libraries still face a gigantic task: in Lithuania 35% of inhabitants between 16 and 74 years of age have not read a book, and 2.5% indicate that they do not read newspapers. (This answer may indicate the discontent of serious readers with the contents of Lithuanian newspapers E.M.)^[27]

The results of the recent study of public libraries in Lithuania have confirmed that the greatest achievement of the independence period is implementation of a new conception of libraries that equals the best international models of the public library. Future development will be defined by the clear cultural policy and modernization

Fig. 3 The numbers of visitors and users to all libraries and public libraries in 2001–2006.

Sources: Statistikos departamentas^[17] and *Lietuvos nacionalinė biblioteka*,^[15]

strategies of central and local governments. The professional community will influence the governmental decisions, but its greatest role is seen in the development of modern information services, increase of professional competence and cooperation between all types of libraries on international and national levels (pp. 15–16).^[20]

School libraries

In 2006, the largest network of libraries (1593) belonged to the Ministry of Education and Science. The category of school libraries includes 1339 primary and secondary school libraries and 76 libraries of professional schools, 41 libraries of higher education institutions (governmental and private), and 137 libraries of other educational institutions.^[15] This network has lost 111 libraries since 2005, mainly due to the continuing reorganization of schools. There are also 150 public library branches that are integrated with school libraries.^[15]

Service levels and conditions of school libraries throughout Lithuania are very unequal. Some meet the highest standards of library work (e.g., Šiauliai Julius Janonis Gymnasium Library, Library of “Verdenė” school in Panevėžys, Šventupis secondary school library in Šiauliai, A. Brazauskas secondary school in Kaišiadorys, etc.), while others just manage to struggle with basic access to educational literature. This depends on the policy of local authorities and school management and the support they provide. The problems these libraries face are the same as those of other types of libraries: shortage of financing for acquisition, difficulties with provision of access to a range of materials, computers, and electronic resources, unsuitable premises and equipment.

Previously, school libraries that had creative staff could take advantage of the competitions and initiatives started by the Open Society Fund for the development of school libraries. In 1999 and 2000, the Educational Change Fund of the OSF announced a call for applications in the areas of “Modernization of the libraries of educational institutions” and “The dissemination of the work models of a modern library” and financed 50 projects for school libraries.

Many school libraries now actively take part in various projects, such as annual Nordic Library Week organized by the Nordic Council of Ministers (Fig. 4) or “Be Friends with a Book. Discover the Lithuanian Book,” initiated in the summer of 2007 by the Ministry of Education and Science in cooperation with the Ministry of Culture.

However, the greatest problem is the lack of professional competence in this sphere. A recent study initiated by librarians and undertaken by the Ministry of Education and Science has shown that 25% of the libraries do not have proper staff (if any). Those employed in school libraries are overworked and underpaid and lack possibilities of professional development as well as guidance and support. Most of them (46.5%) have pedagogical education, 33.9% are educated librarians, and 7% have only

Fig. 4 Nordic Library Week in Šventupis secondary school library.

secondary education.^[29] The competence level, and especially computer or information literacy, is recognized as a most important issue in school libraries. In 2002, the Minister of Education and Science approved the Standard of Computer Literacy for School Librarians.^[30] At present the competence levels in school libraries are crucial as these libraries are involved in the implementation of MOBIS (The Information System for School Libraries—a part of LIBIS). Special courses for training the staff working with this system are organized by the Centre of Professional Development for Teachers.

Academic and research libraries

In addition to other laws regulating library work, academic and research libraries, like school libraries, are dependent on the legislation relating to education, higher education and research. The reforms of these spheres on the national and European level (Bologna process), the growing international cooperation and the access to European and international financing have influenced their present situation. However, most of the achievements, and especially the problems, are in line with other libraries. Although they have fewer libraries than any other network, these libraries are among the most active participants in advancing librarianship in accordance with modern developments.

The network of academic libraries includes 19 libraries at universities and higher education institutions (16 public and 3 private) and 22 libraries at university colleges. There is also a small group of purely research libraries: the Library of the Academy of Science of Lithuania and eight libraries of research institutes. For a long time, academic and research libraries (except for the small libraries in research institutes) were mainly valued for their

collections. One can say that this network is still most burdened with both the worst and the best of the heritage of bygone eras. The Library of the Academy of Science (see <http://www.mab.lt/eng/index.html>) and Vilnius University Library (see <http://www.mb.vu.lt/titulinis>) (Fig. 5) have the status of national significance. Both have rich collections of international interest and play important roles in the system of libraries in general. These two libraries are housed in historical buildings that do not correspond to the requirements of modern libraries. The same may be said of most of other academic libraries. Even when housed in newer buildings, they suffer from a lack of space that prevents open access to the collections, so most still operate closed stacks. This is understood by librarians and many parent institutions. The first academic library (in Kaunas University of Medicine) has recently moved into a new building; others plan construction of new premises or renovation (Vilnius University Library, Šiauliai University Library, Klaipėda University Library, Vilnius Pedagogical University Library). However, the costs of library buildings are high, and the progress in this sphere is slow.

Academic and research libraries are taking a multi-dimensional approach to ensure innovative services for their readers. Academic libraries exploit the possibilities provided by European Union programs, the Open Society Institute (and local OS Fund), Nordinfo, and other funding agencies as well as EU structural funds or governmental projects. In 1997, they established the Lithuanian Academic Library Network (Lietuvos akademių bibliotekų tinklas—LABT), which is driven and coordinated by Lithuanian Academic Libraries Directors Association (LABA) and Kaunas University of Technology. The LABT is an integral part of the LIBIS, though using different software (namely, ALEPH, Metalib, SFX produced by Ex Libris Group). It also has become a part of a wider program of the Ministry of Education and Science, “Information Technologies for Science and Studies” (for 2001–2006). The Network has grown to 75 participating libraries and has expanded its tasks. At present they are as follows:

- Automation of libraries by uniting them into a solid network.
- Rendering of virtual services.
- Accumulation of e-resource bases.
- Creation of a solid search system with unified user interface.
- Ensuring quality links between library e-catalogs and e-resources.^[31]

The LABT develops the multilevel Information System of Lithuanian Research and Studies (publications databases, electronic thesis and dissertations information system) and conducts two big projects financed by EU structural funds: the Lithuanian Virtual Library (see <http://www.lvb.lt>) and Collection and Presentation of Electronic Documents for Lithuanian Science and Studies.

Academic and research libraries have also created the Lithuanian Research Libraries Consortium (see Professional associations and unions), which negotiates licenses and access to the databases with a variety of providers on behalf of its members. At present all the libraries provide access to the international databases relevant to Lithuanian researchers and students. A full list of databases available to Lithuanian users is found at the site of the Consortium (<http://www.lmba.lt/db/angl/index.htm>).

Despite the rapid development of the infrastructure, increased access to the computers and the Internet provided by the universities and the libraries, and the development of online services, some of the problems persist: academic libraries cannot compete with other organizations offering more attractive work environments and salaries to ambitious professionals (especially, working in the areas of ICT, computers and information systems). Furthermore the funding for acquisition is entirely inadequate, and providing user-centered service is inhibited by old premises and outdated library equipment. Academic libraries are confronting these issues as they look for ways to overcome barriers that inhibit them from becoming more modern and relevant for research and studies.

A more detailed account of Lithuanian academic libraries is presented by Pupelienė.^[32]

Networks of special libraries

Certain categories of state libraries are classified as specialized libraries. Among them are libraries with delegated responsibility for special library networks:

- Technical Library of Lithuania is responsible for 21 technical libraries and also has its own branches in the largest cities: Kaunas, Klaipėda, Panevėžys, and Šiauliai. It is a library of national significance. (see <http://www.tb.lt>).
- Lithuanian Library of Medicine is responsible for 38 libraries of health institutions and has six branches in clinics and research centers in Vilnius, Panevėžys, and Klaipėda (see <http://www.lmb.lt/>).
- Lithuanian Agricultural Library takes care of 8 agricultural libraries. (see <http://www.zub.lt/>).

These major libraries were established during the Soviet period and have faced significant changes since 1990. The Technical Library of Lithuania (Fig. 6) is one of the largest in the country (it owns 38,554,600 items), and its unique collections are of great importance to the industry and research. It was the first library to create a Business Information Centre (in 1992) and is now building a specialized collection to serve business information needs. It is also a center of information about national and international standards. Since 1999, the Centre of Patent Information (a depository library of Lithuanian, foreign, and

international patent documents) has been one of the most important functions of the library. The Technical Library is one of the most active supporters of professional librarians' movements and associations.

The Lithuanian Library of Medicine serves the needs of medical researchers, practitioners, and students. It collects medical, biological, psychological, and related literature; some of great historical value. It is a depository library for World Health Organization documentation and a member of the Global Environmental Library Network.

The Lithuanian Agricultural Library "acquires, manages, preserves, and disseminates publications and other documents covering science and technologies of the agricultural sector and related branches of economy." It takes part in the creation of a unified information system for agriculture and an information system for agricultural science. In addition, it functions as a national focal point for AGRIS/CARIS—the system of the International Food and Agriculture Organization.

Among special libraries are 16 museum libraries and 4 libraries of cultural institutions that serve the needs of professional communities in the respective organizations. They fall under the care of the Ministry of Culture.

The Lithuanian Library for the Blind (Lietuvos aklųjų biblioteka—LAB) has a special status as a general public library catering to the needs of people with visual impairments. It also publishes talking books, periodicals and materials in Braille and print. Besides the central library in Vilnius, LAB has five branch libraries in different towns of Lithuania (Kaunas, Klaipėda, Panevėžys, Šiauliai, and Ukmergė) (see <http://labiblioteka.lt/english.html>).

Though the publics served by these libraries are rather limited from the point of view of numbers and the professional needs served, their information services are of great value to the respective spheres of the economy. They are regulated and financed by ministries or state agencies and also participate in common projects and programs of libraries.

RESEARCH AND EDUCATION FOR INFORMATION

The main institution for LIS research and education is the Faculty of Communication at Vilnius University. It carries on the tradition begun at that University in the nineteenth century by famous scholars of that period—Lelewel, Bohatkiewicz, and others—of teaching and studying bibliographic and library work in the cultural context. This tradition was broken for a long time, and it was not until 1940 that the academic department for LIS-related research opened. It functioned in Kaunas and Vilnius universities led by Vaclovas Biržiška (1884–1956) (Fig. 7), a serious scholar of bibliography, the founder of the current national bibliography. In 1949, Vilnius University started an undergraduate program for librarians. It grew and

Fig. 7 Vaclovas Biržiška.

matured under the leadership of Lev Vladimirov (1912–1999) (Fig. 8), one of the renaissance figures on the landscape of Lithuanian LIS. He was director of Vilnius University Library, director of the Dag Hammarskjöld library of the United Nations in New York, author of the only monograph in Lithuanian on universal book history, a reformer of LIS education and a visionary who foresaw the computerized future of information work. In 1991, the departments of Journalism and LIS, previously situated in the Faculty of History, established the Faculty of Communication and developed a number of undergraduate and graduate programs with a common core of communication and information disciplines (see <http://www.kf.vu.lt>). The Faculty also participates as a leading partner in the professional development of working librarians.

Fig. 8 Levas Vladimirovas.

The Faculty of Communication at Vilnius conducts the only doctoral program in Communication and Information Science in Lithuania. Since 1991, 35 students have received a doctoral degree, of which 30 defended their theses in LIS topics. The Faculty was led by a team of researchers in LIS and cognate disciplines—Audronė Glosienė, Arūnas Augustinaitis, Renaldas Gudauskas and others. Recently, Domas Kaunas, the first correspondent member from the Faculty, was elected to the Academy of Science of the Republic of Lithuania. The Faculty also publishes the scholarly journals in LIS: *Knygotyra* since 1961 and *Informacijos mokslai* since 1990 when *Knygotyra* was divided into two separate publications catering to two major directions of LIS (and broader Information and Communication Science), one based on a humanities perspective, the other on social science.^[33]

LIS research is also conducted by the National Library. Currently, it monitors the general situation of Lithuanian libraries and carries out a number of research projects, such as, *The Public Libraries and Their Image* (2005) and *The Image of a Librarian* (in 2006). It also has a strong tradition in reading research. Other academic and research libraries conduct research in the areas of book science, book and library history and bibliography (Library of the Academy of Science, Vilnius University Library), as well as participate in such projects as TEMPUS (1995–2001), EU DEDICATE on distance education information courses (Library of Kaunas University of Technology in 1998–1999), PERINE, pedagogical and educational research information network (Library of Kaunas University of Technology in 2002),^[32] or the EU PHARE project BIBLIONOVA on development of information skills in a learning region (Šiauliai University Library and Klaipėda University Library in 2004).

Library education is also offered at the Department of Librarianship (Faculty of Social Sciences at the Klaipėda University). This department was established in 2001 (studies in Lithuanian Philology and Librarianship started in 1995) to educate librarians for the Northwest regions of Lithuania where the shortage of professionals was felt acutely, especially in school libraries. At present the Department offers several on-campus and distance study options in librarianship (one of them in combination with Lithuanian philology). It also conducts research in the area of academic librarianship, library management, and bibliotherapy.

However, the efforts of LIS departments have not solved the problem of the shortage of professionals. The numbers of librarians graduating with degrees from Vilnius University has diminished and, moreover, young professionals bypass libraries that are not attractive from the point of view of salaries, career, or working environment in comparison to alternatives in the private sector or other fields of the public sector. Broad information and communication competence allows LIS graduates to compete with other specialists on the labor market.

The professional development of librarians is under the auspices of the Lithuanian Centre of Professional Development of Cultural Workers. It organizes courses and seminars for the librarians on relevant topics. In 1999–2004 an Integrated Training Centre for LIS Specialists in Lithuania functioned as part of an initiative on training centers of the Open Society Institute. The Centre was run collectively by the Faculty of Communication (Vilnius University), the National Library, Klaipėda University Library, Vilnius A. Mickevičius County Library, and the Baltic Computer Academy, and it was a successful attempt at cooperation in competence development of professional librarians. In addition, competence development is a part of the most of the projects, that libraries participate in. Librarians also take advantage of possibilities offered by various agencies (Open Society Institute, European Commission, Nordinfo, etc.). In 2006–2007, several university libraries raised the competence of their staff through the Leonardo da Vinci mobility program, “Digital competence and information dissemination in libraries.” Library associations and libraries themselves monitor the level of competence of the staff and changes in the environment and seek to address the emerging needs, using various means.

PROFESSIONAL ASSOCIATIONS AND UNIONS

According to library statistics, 6469 librarians worked in Lithuanian libraries in 2006.^[15] Their number is decreasing with time, e.g., in 2004, there were 7797 librarians. About half of librarians have professional library education. Professional self-consciousness of librarians was beginning to revive in Soviet Lithuania long before the reestablishment of independence. It manifested itself in the circumvention of ideological limitations and regulations in everyday library work and in attempts to organize the professional community. Discussions of the revival of the librarians’ professional organization were started as soon as circumstances permitted, and the Lithuanian Librarians’ Association (LLA) was reestablished on June 29, 1989. Since then, the Association has been an integrating force for all librarians. Specific problems and situations in various libraries lead to the formation of other associations (Lithuanian Academic Library Directors’ Association, Lithuanian County Public Libraries’ Association, Lithuanian Municipal Public Libraries’ Association, Lithuanian College Libraries’ Association). At present the LLA unites more than one third of librarians (2400), and it is still growing. Its main aims are

- To raise the reputation of librarians in Lithuanian society.
- To represent the social and professional rights of its members.
- To initiate and provide in-service training of librarians.
- To petition Lithuanian government and authorities for better recourses and equipment for libraries.

- To gain experience in the world practice of librarianship.
- To ensure the utmost professionalism in its members.^[34]

The Association works through its local chapters in libraries and forms the working groups. In 2005–2007 they were: Library Policy and Fundraising; Continuous Education; School Libraries; Public Libraries; Seniors; Financial Control and Commission of Ethics. The LLA is responsible to its members and organizes the Annual Conference for the members.

The LLA is actively involved in a variety of policy making and lobbying activities: exemptions from copyright for libraries, library renovation and modernization, librarians’ salaries, etc. At present it sees collection development as the most acute problem. Therefore, at the end of 2006, together with the Seimas (parliamentary) Committee for Education and Science, it organized a national conference in the Seimas to discuss the problems of acquisition and collection development with MPs, representatives of the President, and Government. Recommendations were drawn up and the initiative to announce the Year of Reading in 2008 emerged from this initiative.^[35] Since 2001, the LLA has conducted the annual National Week of Lithuanian Libraries, which aims to make libraries visible in society and communities and to unite librarians from all types of libraries. Since 1993, awards and titles of the Best Librarian of the Year have gone to 15 librarians from different libraries all over Lithuania. The LLA initiates various projects and helps libraries take part in various programs. In 2007, together with Utena A. and M. Miškiniai Public Library, the Lithuanian County Public Libraries’ Association, and the Lithuanian Municipal Public Libraries’ Association it has won the award for the best project of public relations of Lithuanian public organizations, namely, the portal of Lithuanian Public Libraries (<http://www.libraries.lt>).

The LLA also actively participates in international projects and develops contacts with similar foreign organizations. In 1990, the LLA was readmitted to IFLA. It cooperates closely with library organizations from other Baltic States, organizing the Congresses of Baltic librarians on a rotational basis (eight so far have been organized). Strong ties with Nordic librarians manifest themselves in common meetings and occasional congresses. Bilateral agreements with library associations from other countries (e.g., Great Britain, Russia, Byelorussia) signify mutual interest in each other’s experience. The LLA also takes part in different international projects. Some of these were especially important for lobbying activities and general understanding of entirely new problems for Lithuanian libraries, e.g., copyright for libraries (CECUP—Central and Eastern European Copyright User Platform); licensing of digital resources (CELIP—Central and Eastern European Licensing Information Platform).

Others address the needs of the partners, e.g., the establishment of Martynas Mažvydas library of the Lithuanian community of Sovetsk (Kaliningrad, Russia).

Both directions of LLA activity help achieve the aims of the Association and channel the efforts of librarians to the achievement of common goals.

The Consortium of Lithuanian Research Libraries (see <http://www.lmba.lt/>) has a different direction, but it also serves the needs of all Lithuanian libraries. Its main aims are

- Promotion of the creation of virtual libraries, preparation and implementation of advanced technology and innovative projects in the libraries.
- Subscription to electronic databases for Consortium members and other libraries.
- Coordination of the acquisition of foreign periodicals among research libraries.

The Consortium has 38 member libraries of various types. It is supported by the Ministry of Culture, the Ministry of Education and Science (the acquisition of databases is partly financed by ministries), Open Society Fund (Lithuania) and Open Society Institute, British Council Lithuania and other agencies. Its main activity is negotiation of licensing agreements with the providers of online databases, organization of their deployment, and control of usage. Its efforts extend beyond its 38 members and benefit other libraries and their users. It organizes seminars and training for librarians, participates in eIFL.net consortium and is a member of EBLIDA (European Bureau of Library, Information and Documentation Associations). It regularly informs the librarians in Lithuania of its activities and news about work with databases.^[36] It also disseminates expertise and examples of best practices of licensing and working with digital resources to librarians of other countries (Russia, Georgia, Byelorussia, Kyrgyz, Lebanon, Jordan, etc.)

CONCLUSION

The Lithuanian library sector at present functions as a modern, open, user-oriented and professional system comparable to other library sectors in Europe. In the 17 years since the restoration of independence, there has been a dynamic development of new services, expertise, and models. Equally important are the activities of professionals who participate in shaping the libraries of the future in Lithuania. The catalysts for this transformation include the changing society, the economy, and the arrival of new concepts and technologies, as well as the strong commitment of librarians to fulfill their professional obligations. The international professional community, various funding agencies, and international bodies also supported these changes. The role of funding agencies, especially the Open Society Fund (Lithuania) and the

Open Society Institute were essential in stimulating the creativity of librarians and in some cases these agencies also helped by drawing the attention of authorities to the importance of libraries. In addition, international bodies, such as the Nordic Council of Ministers, Nordinfo and the European Commission, helped to create international networks, and taught Lithuanian librarians to work together with partners from other cultures, and adapt their models and experiences to Lithuanian conditions. Close partnerships with librarians from the Nordic countries have influenced the directions of development of Lithuanian libraries. While adopting the best international practice, Lithuanian librarians have also preserved the best local traditions. The community of Lithuanian librarians still needs to go a long way to overcome the inertia of the central and local government, not only in their habit of severely underfunding libraries but also in treating libraries as inefficient and unnecessary appendices to the country's economy. This is an especially difficult but most urgent task. The future of libraries will mainly depend on the policies and strategies adopted and implemented by the government as well as on the energy and attention of librarians devoted to library users' needs and to the development and expansion of innovative, high quality services that span physical buildings and virtual spaces.

ACKNOWLEDGMENTS

I would like to thank my friends and colleagues—Emilija Banionytė, Jūratė Bičkauskienė, Audronė Glosienė, Eduardas Macevičius, Aušra Navickienė, Ramunė Petuchovaitė, Antanas Senkus and others—who have helped me to write the entry by finding required material, reading and commenting on the text and supporting my efforts in other ways.

Louvre

Bette W. Oliver

Austin, Texas, U.S.A.

Abstract

The Louvre evolved from the castle fortress of Philippe-Auguste in 1190 to a royal residence occupied by French monarchs until Louis XIV moved to Versailles in 1678, and finally in 1793, into the national museum of France. Under both royal and republican governments, the museum has enriched its collections and enhanced its building program culminating in the creation of the Grand Louvre, begun under François Mitterrand in the 1980s and finished under Jacques Chirac in 1996. The Louvre is considered the finest example of a universal survey museum in the world and is visited by millions of tourists and scholars annually.

The Louvre evolved from the castle fortress of Philippe-Auguste in 1190 to a royal residence occupied by French monarchs until Louis XIV moved to Versailles in 1678, and finally in 1793, into the national museum of France. Today, considered the finest example of a universal survey museum in the world and visited by millions of tourists and scholars, the Louvre has become what its founders intended when they preserved and enriched its collections during the period of the French Revolution and the First Empire (1789–1815). Under subsequent governments, whether royal or republican, the museum has continued to add to its collections and to enhance its building program, resulting in the realization of the Grand Louvre, which began under François Mitterrand's presidency in the 1980s and later culminated in Jacques Chirac's presidency in 1996 with the architectural additions designed by I.M. Pei. "The Louvre was the prototypical public art museum," according to art historian Carol Duncan. "By the end of the 19th-century, every western nation would boast at least one important public art museum."^[1]

THE EARLY LOUVRE

The evolution of the Louvre has been subject to the changing needs of the French state. First, it served as a square fortress positioned on the right side of the Seine to defend against attacks from the English to the north. Archeological evidence of the original castle and its moat was discovered during construction work for the Grand Louvre. Under the reign of Charles V (1364–1380) and his architect Raymond du Temple, the palace was raised and terraces were added as it was incorporated within the defensive walls of Paris. François I (1515–1547) chose to transform the Louvre into more of an Italian Renaissance palace with additions designed by Pierre Lescot, notably the Hall of the Caryatids. More importantly, François I

had amassed a fine collection of paintings at his residence of Fontainebleau including several works by Leonardo da Vinci, who died at Amboise in 1519. Works by Raphael, del Sarto, and Fra Bartolomeo, among others, would form the basis of the collections for the Louvre Museum.

Building continued under François I's successor, Henri II (1547–1559) and his widow Catherine de Medici, who in 1564 ordered the construction of the Palais des Tuileries, which would be joined to the Louvre. Under Henri IV (1568–1610), the first Bourbon king, the Grand Gallery was built and the collections enriched, while artists and craftsmen were invited to live and work in the palace. Under Louis XIII (1610–1643) and his architect Jacques Lemercier, the palace was enlarged and the imposing Tower Clock Pavilion was constructed. During Louis XIII's reign, Cardinal Richelieu added to the royal collections, and upon his death in 1642 his property, the Palais Cardinal, passed to the king and became known as the Palais Royal, situated directly behind the Louvre.

Cardinal Mazarin ruled as regent for Louis XIV until his death in 1661 and worked to enrich the royal collections. When Mazarin died the Louvre became the beneficiary, receiving works by Correggio, Raphael, Veronese, Titian, and Holbein, among others. Louis XIV's astute minister, Jean-Baptiste Colbert, purchased many fine works for the royal collection. The Sun King's architect, Louis Le Vau, was responsible from 1661–1670 for major additions to the Louvre, including completion of the north and south wings of the Cour Carrée, the Cour de la Reine, the Apollo Gallery, the Arts, Marsan, and Marengo pavilions, and with Charles Perrault and Charles LeBrun, the building of the Colonnade. In 1678, when the work on the Cour Carrée had been completed, Louis XIV chose to move himself and his royal court to Versailles, where he would remain until his death in 1715. The Louvre then served as the home of artists and academics, where they

would remain until 1793, when the Louvre would become the national museum of France.

The royal collection was no longer centralized after Louis XIV's move to Versailles, but the 1709–1710 inventory listed 2000 paintings. By the time Louis XV (1715–1774) had become king, many paintings from the royal collection were exhibited in the private homes of aristocrats, but in 1725 the Academy of Painting and Sculpture held its first exhibition in the Salon Carrée. These exhibitions at the Louvre would be held annually from 1737 to 1848.^[2]

In keeping with Enlightenment ideas on the role of the state in the arts and sciences, a movement developed to transform the Louvre into a great palace of the arts. The Count d'Angiviller, curator of the royal Cabinet des Peintures, sought to increase the royal collection and in 1774, with the ascension of Louis XVI (1774–1793), worked to increase acquisitions for the proposed museum and to undertake architectural improvements. These acquisitions included not only early works from Italy and France but also contemporary French paintings from the annual salons and a large number of seventeenth-century Dutch and Flemish works. D'Angiviller aimed to create a museum that would reflect national pride and royal glory, as well as one that would address the needs of a larger public who were interested in viewing great works of art. The average annual expenditure on the Louvre in the early 1780s was approximately 100,000 livres, while d'Angiviller spent one million livres on increasing the royal collection over a 15-year period.^[2,3]

FRENCH REVOLUTION AND NAPOLEONIC ERA

The advent of the French Revolution in 1789 led d'Angiviller, and many others loyal to the king, to flee into exile, but plans for the Louvre Museum escalated, even as the new republican government faced challenges from every side. Decrees were passed by the National Assembly to make the Interior Ministry, under Jean Roland, responsible for safeguarding the national collections, defining the role of the national museum, and creating a commission for the selection of artworks. The confiscations by the republican government of art works that had belonged to the church, the crown, the émigrés, and those who had been imprisoned or executed, amounted to a windfall for the museum. By the time the Louvre Museum opened officially on August 10, 1793, as many as 537 oil paintings and 124 marble and bronze sculptures, and other objects, were displayed in the Grand Gallery, all of which the public could visit three times a week free of charge; the other days were reserved for artists and special guests.^[4,5]

As the revolution within France led to the Napoleonic wars with other western European monarchies, the legally decreed confiscations of artworks, as well as books and

manuscripts, increased dramatically. The first manifestation of this policy became clear with the arrival in Paris of seven convoys of paintings taken from Belgium in 1794. An inventory of each convoy was made upon its arrival, and each painting was identified. Gilberte Emile-Mâle, who served as head of restoration services for the French national museums from 1971 to 1981, documented in some detail the contents of each of the seven convoys from Belgium, as well as indicating the current location of each painting wherever possible. Included in these works were pieces by Rubens, Van Dyck, Jordaens, Van Eyck, Teniers, de Lairese, and other lesser-known Dutch and Flemish artists; they had been taken from churches and city halls in Antwerp, Brussels, Bruges, Lille, Dunkerque, and St. Omer.

Later convoys would arrive from Italy, Austria, Germany, and Spain, all heralded by public announcements in the press, so that by the time the artworks arrived in Paris, the public was eager to view them at the museum. For example, the third convoy of Italian artworks in 1798 amounted to a treasure trove of 45 cases of fine art, books and manuscripts, and natural history materials loaded onto wagons, 25 of which contained the cases of paintings and sculptures, and a special wagon to display the bronze horses taken from St. Mark's in Venice. A special song composed for the occasion proclaimed, "Rome is no more in Rome/ it is all in Paris."^[3,4]

In addition to the foreign confiscations, artworks from Versailles and from the abolished Royal Academy of Painting and Sculpture were sent to the Louvre. In 1797 the Apollo Gallery was opened, and by 1799 half of the Grand Gallery had been renovated and filled with Flemish and Dutch paintings. By 1801, the Italian works were arranged in the remaining half of the Grand Gallery.^[2]

Napoleon's influence became ever more evident, thanks to the careful acquisitions of artworks from conquered countries. Both the Louvre Museum (at that time called the Musée Central des Arts) and the Bibliothèque Nationale had sent experts, armed with lists of items to be confiscated, to accompany the military units engaged in combat. As a result of a plebiscite in 1802, Napoleon was named Consul for life, and in 1804, by another plebiscite, he was made Emperor. The First Empire, which would last until 1814, had begun.

The name of the museum was changed to the Musée Napoleon in 1803 and its first director was Dominique Vivant-Denon, an artist and writer who had participated in Napoleon's Egyptian campaign. Napoleon appointed the architects Charles Percier and Pierre-François Fontaine to make extensive improvements to the museum, including the division of the Grand Gallery into nine sections with skylights installed to enhance viewing, as well as the creation of an imposing new staircase. Under Denon's supervision, the museum's collections continued to increase as acquisitions followed military victories in Germany and Spain.^[2]

With Napoleon's final defeat and forced abdication in 1815, many of the artworks exhibited at the museum were returned to their countries of origin. The representatives from those countries, who met at the Congress of Vienna in 1814–1815 to address how best to control Napoleon's power and influence, had decreed this repatriation of valuable cultural items. However, many of the foreign acquisitions remained at the museum due to bureaucratic obstruction and clever diplomacy. For example, of the 506 paintings confiscated from Italy, 249 were returned, 248 remained, and 9 had mysteriously disappeared.^[5]

The Napoleonic wars had greatly increased artistic activity across Europe, and spurred the development of subsequent national museums based on the successful model of the Louvre. Just as its founders had intended in 1793, the museum had become a great cultural institution, and Paris had become the art capital of the western world and would remain so until the mid-twentieth century.

NINETEENTH-CENTURY DEVELOPMENTS

The museum, once again renamed the Musée Royal, grew more slowly after the Bourbon Restoration in 1815, because the period of great military glory and acquisitions had ended with Napoleon's downfall. However, under Louis XVIII (1815–1824) and Charles X (1824–1830), both brothers of the executed Louis XVI, Napoleon's building projects continued, including the Rohan Pavilion. Count Forbin replaced Denon as director of the museum in 1816, serving in that position until 1836. Paintings transferred from the Palais du Luxembourg replaced those that had been repatriated in 1815, and three halls of the Grand Gallery were filled with French artworks. During the Restoration period, the Egyptian section of the museum was opened on the first floor of the Cour Carrée and the future Department of Sculptures was inaugurated.^[2]

Following the Revolution of 1830 and the ascension of Louis Philippe (1830–1848) of the Orléans branch of the royal family, work on the Assyrian Halls proceeded, but not much more was accomplished until Louis Napoleon gained power through a plebiscite in 1848, much like his uncle had before him. He was named Emperor and ruled as Napoleon III from 1851 to 1870. Under his architects, Joachim Visconti, Hector Lefuel, and Felix Duban, the New Louvre (now called the Musée Imperial) was constructed around the Place Napoléon. The Flore Pavilion and the western section of the Grand Gallery were demolished and reconstructed, while the parallel buildings on the north and south sides of the Carrousel area were built and connected to the new wing on the new rue de Rivoli. The Musée des Souverains was established on the first floor of the Colonnade to display the former splendor of the Valois and Bourbon dynasties.^[2,6]

Following the Franco-Prussian War during the period of the Commune in 1871, the Palais des Tuileries was set

afire, which destroyed the Marsan Pavilion, the western section of the Galerie Napoléon, and the library. The Tuileries Palace was not rebuilt, but reconstruction of the other areas continued from 1871 to 1878.^[2]

With the fall of Napoleon III after the French defeat in the Franco-Prussian War, and the establishment of the Third Republic (1870–1940), a period of relative calm ensued. This hiatus allowed for gradual embellishments to the museum and for the acquisitions of important nineteenth-century artworks. A gallery of living artists was established in 1886 at the Orangerie Museum nearby, which would later contain a large collection of Impressionist paintings. In 1900, the Hall of States, later called the Hall Rubens, was completed. In addition, the Musée des Arts Décoratifs was opened in 1905. In 1914 work began on the second floor of the Mollien Wing, but the advent of World War I necessitated closing the Louvre for the duration of the war. From 1926 to 1939, the director of the museum was Henri Verne, who set about reorganizing exhibitions and restoring artworks. The Impressionist paintings were transferred from the Orangerie and installed on the top floor of the Colonnade, while eighteen new halls were opened on the third floor of the Vieux Louvre.^[2]

CHANGES AFTER WORLD WAR II

In anticipation of certain war and a Nazi invasion, a massive exodus of valuable artworks from the Louvre to the provinces began in 1938 and continued into 1939. In preparation, the Department of Paintings, under the direction of René Huyghe, was divided into sectors; each painting in a sector was packed and labeled according to its destination. Five châteaux between Le Mans and Louvigny and eighty warehouses in the provinces had been requisitioned to receive the artworks.^[7] Despite the Nazi confiscations of private collections and museums during the Occupation, the paintings from the Louvre were saved and returned in 1945. A number of unclaimed recovered works from private collections also found a temporary home in the Louvre, which assumed responsibility for them as long as they remained unclaimed. In some cases, that could be forever, if there were no living heirs to claim them.^[8]

The opening of the Grand Gallery in 1947, featuring some improvements that originally had been advocated by the artist Hubert Robert in 1796, contained artworks from the Italian and Spanish schools. Meanwhile, the Impressionist paintings were moved yet again, this time to the nearby Jeu de Paume, where they would remain until their transfer in 1986 to the new Musée d'Orsay across the Seine.^[2,4] The Daru, Mollien, and Denon Halls were reopened in 1949 and, under the new curator for paintings, Germain Bazin, the artworks from the French school were returned from the Petit Palais.^[2] The new sculpture rooms in the Flore Wing, which would later be connected to the Grand Gallery,

opened in 1960, and in 1968 those collections dated after 1848 were transferred to the Musée d'Orsay. The Richelieu Wing, which had been the home of the Ministry of Finance, was inaugurated as part of the museum in 1981, the same year that President François Mitterand set forth his impressive plans for the Grands Travaux.

Other internal changes were underway as well at the Louvre in the 1980s. In 1987, the director of the Musées de France, Hubert Landais, asked Michel Laclotte, head of the Paintings Department at the Louvre, to assume the role of director of the museum. Three administrators who worked under the supervision of the Musées de France had previously filled that position. With the appointment of Laclotte, the director's position conferred greater decision-making authority and staff support. Pierre Rosenberg, who later became museum director himself, assumed the duties of head of the Paintings Department. Under Laclotte's management, museum personnel would be involved in the changes necessary to transform the old Louvre into the new Grand Louvre.^[6,9]

THE GRAND LOUVRE

Mitterand's ambitious building program included the modernization of the Louvre, making it the Grand Louvre, and new buildings for the Bibliothèque Nationale de France, the Opéra de la Bastille, and the great arch of La Defense. The Grand Louvre project, which began in 1982 and was completed during Jacques Chirac's presidency in 1996, amounted to a series of dramatic architectural innovations, the most prominent being that of I.M. Pei's great glass pyramid as the central entrance to the museum. Pei enjoyed a reputation as an innovative architect, and his renovation of the National Gallery in Washington, D.C. offered proof that he could successfully modernize a museum located in an older building, or in the case of the Louvre, an ancient building. The immensity of the Grand Louvre project demanded careful planning, budgeting, and consideration of the urban aspects of the museum, such as parking, situated as it is in the historic heart of Paris. It was a matter of

conceiving and overseeing the development of the Domaine Nationale du Louvre et des Tuileries in view of creating an original cultural complex of museological character which will be called the Grand Louvre, as well as providing for the integration of this complex into its environment.^[6]

Like the Eiffel Tower, Pei's glass pyramid, widely admired now, was a hotly debated topic when it was proposed in the early 1980s. Some critics feared that such a structure would destroy the aesthetic appearance of such a beloved and historic structure as the Louvre. However, the idea of a pyramid was actually appropriate because the museum's Egyptian collection was one of the best known

in the world. In addition, the glass tower provided much-needed light into the entrance hall, which is situated directly below it, connected by an escalator. In effect, the pyramid literally opened up the museum and made it a more welcoming venue for its millions of visitors. The large space created beneath the Cour Napoléon allowed for the addition of various shops and services, including a conference hall, an auditorium, a bookstore, and a cafeteria. In 1993, after the Finance Ministry was relocated and the Richelieu Wing became available, it was possible to use one of the glass-covered courtyards to display the famous Marly horses, great marble sculptures that had once graced the gardens of Marly-le-roi under Louis XIV. In addition, the Passage Richelieu was transformed into a public space to link the new section of the Louvre with the Place du Palais-Royal across the street.^[2,6] Thus, public access to the museum was facilitated, while at the same time providing an attractive window into the museum.

The traditional boundaries between the seven sections of the museum which housed the collections were maintained, but access to the collections was centralized at the main entrance in the Cour Napoléon. The collections are divided into the archeological sections (antiquities) and the four sections of art ranging from the Middle Ages to mid-nineteenth century (graphic arts, decorative arts, painting, and sculpture).^[6] These sections include: Oriental Antiquities, Egyptian Antiquities, Greek Antiquities, Etruscan Antiquities, Roman Antiquities, Arts of Islam, Sculptures, Objects of Art, Paintings, and Graphic Arts.

While it is generally agreed that the Grand Louvre is a grand success, with the number of visitors increasing every year, such good fortune has led to some budgetary problems. The French government spent \$1.1 billion between 1987 and 2002 on architectural improvements, which led to greater public access and the necessity of increasing the museum staff. While part of the museum's budget is dependent on the government, other sources of income derive from entrance fees, special exhibitions which draw the largest crowds, and related services within the museum complex. In addition, private funds are raised for specific projects, such as the new Mona Lisa Gallery, financed by Nippon Television of Japan, and the construction of a new wing for the Louvre's large collection of Islamic art, the funds for which were donated by a Saudi prince. Even for those who cannot visit the Louvre in person, it is possible to view its treasures via the Internet (<http://www.louvre.fr>) and to purchase the excellent scholarly catalogs that accompany special exhibitions.^[4]

The Louvre also will exist in other locations outside of Paris. The Louvre-Lens, in the Nord-Pas de Calais region of France, is expected to open in 2010, while the Louvre Abu Dhabi, designed by Jean Nouvel, is scheduled to open in 2012 or soon thereafter. The government of Abu Dhabi is willing to pay France \$747 million in exchange for using the "Louvre" name as well as for loans of artworks, special exhibitions, and management advice.^[10] The evolution of

the Louvre from a fortress to a royal residence and finally to one of the greatest museums in the world is a tribute to the many visionaries who worked to make it such a success. The government of the first French republic took it upon itself to ensure that the national museum would reflect the high ideals of the early days of the Revolution of 1789 and allocated sufficient funds to preserve and enrich its collections. That they did so, while dealing with ongoing conflicts both inside and outside of France, is a tribute to their determination to transform the Louvre into a public symbol of French culture. Other visionaries were needed to have the courage to make radical, if beneficial, changes to what, by the 1980s, had become a hallowed national institution. One of the oldest museums in Europe, the Louvre's collections encompass artworks from the earliest civilizations to those of modern times, truly a universal survey museum of the highest order.

As Carol Duncan has stated: "The importance of the Louvre for other national galleries and as an international training ground for the first community of professional museum men is everywhere recognized."^[1] Perhaps President Charles de Gaulle's culture minister, André Malraux, said it best in speaking to the National Assembly on December 14, 1961. Explaining why it was important to appropriate funds for the preservation of France's historical monuments, such as the Louvre, he said that such monuments represented the highest aspirations of their time, that they were "the greatest dreams of France," which would serve to provide hope and courage to future generations of French citizens.^[11] The Louvre continues to pursue this mission as it expands to serve an ever-increasing public.

Machine Readable Cataloging (MARC): 1961–1974 [ELIS Classic]

Henriette D. Avram

Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

The MARC Program of the Library of Congress, led during its formative years by the author of this entry, was a landmark in the history of automation. Technical procedures, standards, and formatting for the catalog record were experimented with and developed in modern form in this project. The project began when computers were mainframe, slow, and limited in storage. So little was known then about many aspects of automation of library information resources that the MARC project can be seen as a pioneering effort with immeasurable impact.

—*ELIS Classic*, from 1975

INTRODUCTION

Many words have been written on the subject of the Machine-Readable Cataloging (MARC) Program: the events that led to the pilot project, the development of the format, the operational Distribution Service, the influence of MARC on standardization, and the impetus it gave to library automation projects and to the creation of networks here and abroad. This article serves to gather together all aspects of the national and international MARC system.

Much of what follows has been fairly well documented in many published reports, journal articles, etc., and therefore this article relies heavily on that material. A Bibliography based on the article's main headings has been included for those readers who wish to explore any aspect of MARC in greater depth.

BACKGROUND, 1961–1965

The Library of Congress's (LC) investigations of the possibility of using automated techniques for its internal operations began in the late 1950s. As a result of the interest generated by these investigations, the Librarian of Congress requested a grant from the Council on Library Resources (CLR) for a study to determine the feasibility of applying automated techniques to the operations of LC. The study, published in 1963,^[1] recommended that a group be established to design and implement the procedures required to automate the cataloging, searching, indexing, and document retrieval functions. A systems staff was assembled in the Office of the Librarian to proceed with the recommendations. During this same period, motivated by the increasing attention given to automation in libraries, CLR awarded a contract for a study of the possible methods of converting the data on LC cards to machine-readable form for the purpose of printing

bibliographical products by computer. The report of the study^[2] was the subject of a conference held at LC in January 1965, under the sponsorship of LC, the Committee on Automation of the Association of Research Libraries (ARL), and CLR. Participants included representatives from universities, research agencies, government agencies, and private industry. The conferees concluded that:

1. Availability of machine-readable catalog records produced and distributed by LC would help those libraries that have automated systems.
2. The machine-readable record should include all the data presently available on LC's printed card, plus additional information to produce a multipurpose record.
3. Agreement by a broad segment of the library community on the elements to be included in the record was most desirable, and the design of the record at LC was probably the best means of achieving standardization.

Three LC staff members were assigned to the task of analyzing cataloging data from a machine processing point of view. A report,^[3] issued in June 1965, was reviewed by over 150 LC staff members and their comments were issued as a supplement to the report. Comments were also elicited from many representatives of the library community.

The report was discussed at a conference supported by CLR and held at LC in November 1965. The enthusiasm generated at this meeting again demonstrated the desirability of LC becoming the distribution source of machine-readable records. As a result, LC sought funds from CLR to conduct a pilot project and in December 1965 received a grant to test the feasibility and utility of the distribution of cataloging data in machine-readable form from LC to user libraries. The project was named MARC, for *machine-readable cataloging*.

MARC PILOT PROJECT, 1966–1968

Planning for the pilot project began early in January 1966. CLR funds were used for contractual support: 1) to develop procedures and programs for the conversion, file maintenance, and distribution of MARC data, as well as programs to use the data at the participating libraries; and 2) to assist in the evaluation of the project. Participants in the pilot project were invited by LC, and from the 40 libraries that responded affirmatively, 16 were chosen. Selection was based on type of library (special, government, state, university, public, and school), geographic location, availability of personnel, equipment, funds, proposed use of MARC data, and willingness to evaluate the utility of the data and prepare written reports. It was thought that for the project to provide the most useful information, different types of libraries and geographical areas should be represented. The first (types of libraries) was a valid decision; the second (geographical areas) is questionable.

The participants selected were: Argonne National Laboratory; Georgia Institute of Technology; Harvard University; Indiana University; Montgomery County Public Schools; Nassau (County) Library System; National Agricultural Library; Redstone Scientific Information Center; Rice University; University of California Institute of Library Research, Los Angeles; University of Chicago; University of Florida; University of Missouri; University of Toronto; Washington State Library; and Yale University. By February 1966, the LC staff assigned to the project was prepared to call a conference of the participants for the purpose of describing: 1) the concepts, objectives, schedules, functions, and requirements of the experiment; 2) the operation at LC; 3) the MARC format; 4) the materials to be sent weekly to participants; and 5) the content of the reports expected from the participants. The February meeting was considered the official opening of the pilot project. [The pilot project format, later in the life of the project, was called MARC I to differentiate it from the distribution format (MARC II), which was designed later.]

LC set for itself the herculean task of completing within eight months the design of procedures and computer programs required both for the LC operations and for the participants. The MARC I format had to be stabilized by April 1966 to begin programming. Consequently, the time spent in analysis and design was severely limited and the form of material was restricted to book materials.

The first distribution was to begin in September 1966. Actually, the first test tape was mailed in October and the weekly service began in November.

The months following the initial distribution were hectic for all. The computer programs provided to participating libraries were not, in all cases, error free and had to be modified; the participants were busily engaged in writing

their own tailor-made programs; and LC was learning better production methods “on the job” to reduce the large number of incorrectly edited and inadequately verified records. The load on the telephone lines between the participants’ locations and Washington, District of Columbia, was heavy from November 1966 through the next several months.

The pilot project had originally been scheduled to end in June 1967. This termination date, however, seemed unrealistic. Setup time had taken longer than anticipated at the participating libraries and, with June as a cutoff date, there could be little operational experience. LC stated at the midwinter meeting of the American Library Association (ALA) in January 1967 that the pilot would be extended. (LC made arrangements to hold MARC meetings during ALA conferences as a vehicle of communications with pilot participants.) During the next six-month period, it became obvious that MARC served a useful purpose and, encouraged by the enthusiasm of the library community, LC announced at the June 1967 ALA/MARC meeting that a full-scale operational MARC Distribution Service was in the planning stages. The pilot project would continue through June 1968 while the operational system was being planned and implemented. The pilot service was extended to four additional participants—California State Library, Illinois State Library, Cornell University, and the State University of New York Biomedical Communications Network.

The participating libraries experimented with card catalog and book catalog production, current awareness listings, filing arrangement by computer, etc. Not all participants were successful in mounting an operational system but, nonetheless, all cooperated to the fullest in reporting back to LC the pros and cons of each aspect of the project. In particular, the need for timely receipt of data and quality of records was stressed.

Part of the rationale for the pilot project was the test of a machine format under operational conditions in order to design a next generation format based on the experience gained. In addition to the substantive evaluation of the MARC I format provided by the participating libraries, an important event occurred during the project which exerted a strong influence on the design of MARC II. The interest expressed by the British National Bibliography (BNB) in mounting a UK/MARC Pilot Project and the many visits from foreign librarians directed thinking toward a standard communications format suitable for interchanging bibliographic data, not only from one organization (LC) to many, but also among organizations, perhaps crossing national boundaries.

The philosophy behind MARC II was the design of one format structure (the physical representation on a machine-readable medium) capable of containing bibliographic information for all forms of material (books, serials, maps, music, journal articles, etc.) and related records (name and subject reference records, etc.). The

structure, or “empty container,” the *content designators* (tags, indicators, and subfield codes) used to explicitly identify or to additionally characterize the data elements, and the *content*, the data itself (author’s names, titles, etc.), are the three components of the format. It was recognized that under ideal conditions the universe of material would be studied at one time for a more coordinated approach to the assignment of content designators. However, those responsible knew the magnitude of such a task, the time required, and the need for specialists to be involved. Consequently, to make progress in the near term, it was decided to handle one form of material at a time, beginning with books.^[4]

LC staff held many meetings discussing the book format contents and content designators. The intent was to provide a multipurpose record “rich” enough in detail to allow inclusion or exclusion of data elements based on the user’s needs. The resultant MARC II format for books reflects the consensus of a large number of librarians and systems personnel.

Another significant outcome of the pilot project was the design of an extended character set for roman alphabet languages. At the onset of the project, a character set was specified based on the work in progress by the Library Typewriter Keyboard Committee of the Resources and Technical Services Division of ALA. Once the pilot was in operation, LC, in consultation with the National Agricultural Library and the National Library of Medicine, turned its attention to the development of an extended character set to cover all the major roman alphabet languages as well as the romanized forms of nonroman alphabets.

In December 1967 a meeting funded by CLR was held at LC for the purpose of discussing the MARC II format and the proposed character set. This meeting was particularly significant since the participants, based on shared experiences in the pilot project, were setting the framework for an operational MARC system that would have wide implications for the entire library community and the future of automated library systems.

At the conclusion of the pilot project in June 1968, LC had distributed approximately 50,000 machine-readable records for English language book materials. All concerned were a little wiser than at the onset of the experience. LC had learned a great deal about the procedures and the funds needed to convert cataloging data to machine-readable form. The participants realized the complexities inherent in applying the computer as a tool for library operations and the requirement for management support, time for implementation, and funds. All organizations were aware of the close cooperation required between computer and library personnel for a successful project.

A project report^[5] was published in 1968 describing the experiences of LC and participating organizations, the expanded character set, and the MARC II format.

MARC DISTRIBUTION SERVICE, 1968–

From June 1967 through June 1968, LC staff, in addition to concentrating on the MARC II format design and the expanded character set, were engaged in the redesign of the procedures and programs for the operational MARC Distribution Service. The pilot project was officially terminated in June 1968, and from July through March 1969 LC shifted over to a period of testing the new procedures and programs.

During this practice period, a proposal was written by LC to the Information Science and Automation Division of ALA recommending that a series of workshops (which became known as the MARC Institutes) be held throughout the country for the purpose of briefing library staffs on the MARC II format, LC procedures, and the uses of MARC data by libraries during the pilot project. The first institute was held in Seattle, Washington, in July 1968. This series continued for several years and was attended by over 2000 individuals.

The first *Subscriber’s Guide to the MARC Distribution Service* [which later became *Books: A MARC Format*^[6]] was published in August 1968 so that institutions planning to subscribe to MARC would have the necessary information for programming. The *Guide* was followed by a test tape in the fall of 1968 to provide the means of checking user programs.

In March 1969 the operational system was launched covering all English-language monographs cataloged by LC including titles acquired through the National Program for Acquisitions and Cataloging (NPAC). (Initially, only United States imprints were distributed but this was rapidly expanded to include all English-language monographs.) The distribution cycle was weekly, and approximately 1000 records appeared on each MARC tape.

Before the actual implementation of the distribution service, a great deal of interest was generated in MARC procedures. Consequently, in 1969, LC issued, through ALA, the first edition of the *MARC Manuals*.^[7] This publication contained the *Data Preparation Manual: MARC Editors*, the *Transcription Manual: MARC Typists*, the *Subscriber’s Guide to the MARC Distribution Service*, and *Computer and Magnetic Tape Unit Usability Study* (an analysis to determine which computers and peripheral devices could be used to process MARC tapes).

Because of hardware limitations and time and funding constraints, the new MARC system was designed as a batch tape system composed of four subsystems: input, file maintenance, retrieval, and output. The programs within each subsystem were generalized, data independent where possible, table driven where the characteristics of the data were known (i.e., validation of tags across forms of material), and parameterized to the extent possible to

allow the specification of unique requirements (e.g., output formatting).

From the beginning of the design phase, LC staff recognized that the system would require updating to use disk as the storage medium and to provide for online correction. (In the LC environment, online input of new records is not desirable but there is a definite need for on-line correction and verification to reduce the volume of paper work and expedite the processing of records). In 1971, work was begun on the Multiple USE MARC System (MUMS) to provide on-line capability and on the redesign of the MARC input and maintenance system.

In accordance with the original plans to specify MARC formats for forms of material other than books, LC published formats for serials^[8] and maps^[9] in 1970, films^[10] in 1971, and manuscripts^[11] in 1973. The music and sound recordings format is in draft form at the time this is written and should be published in 1975.^[12] In the design of all formats, LC worked with other organizations that had expert knowledge of the material concerned.

The distribution service has been expanded as funding permitted. Distribution of records for films began in 1972, and for serials, maps, and French-language monographs in 1973. The present services represent approximately 105,000 records per year. If the service is expanded to include books in other romance languages and in German late in 1974, the total record count will reach approximately 150,000 annually. As of summer 1974, the database totaled approximately 500,000 records. The present service is available in several forms. These include: 1) all MARC records; 2) books (All) covering records for English-language monographs including titles acquired through NPAC, titles in all languages in the Cataloging in Publication (CIP) Program, and French-language monographs; 3) books (English) as described in books (All) above, but excluding the French-language records; 4) films, covering motion pictures, filmstrips, transparencies, slide sets, and other projected materials, in all languages; 5) maps, covering records for single and multisheet thematic maps, map sets, and maps treated as serials, in roman-alphabet languages; and 6) serials, covering all serials receiving printed card cataloging, including romanized records for titles in nonroman alphabets. Records for books (English) and films can be purchased in annual cumulations. Test tapes for all services are available for experimental purposes.

In 1973, LC suggested to the Resources and Technical Services Division/Reference and Adult Services Division/Information Science and Automation Division (ALA RTSD/RASD/ISAD) Committee on Representation in Machine-Readable Form of Bibliographic Information (MARBI) that a MARC advisory committee be formed to work with LC regarding changes to the various MARC formats. The MARBI committee decided it would be the MARC advisory committee, and LC was asked to prepare a paper^[13] proposing how such a committee would operate in relationship to the MARC Development Office (MDO).

The LC proposals and recommendations were adopted by the MARBI committee during its meeting at the 1974 ALA midwinter meeting.

The term "change" includes additions, modifications and deletions of content data (in both fixed and variable fields), and content designators made to the format as well as additions, modifications, and deletions made to the tape labels. The changes under consideration fall into five categories: 1) changes resulting from a change in cataloging rules or systems, 2) changes made to satisfy a requirement of LC, 3) changes made to satisfy a subscriber's request, 4) changes to support international standardization, and 5) changes made to expand the MARC program to include additional services.

Guidelines have been established to handle the above categories of changes and a time period set for the MARBI committee, working through the MARC users, to react to a proposed change. LC agreed to notify MARC subscribers two months prior to including any change in the MARC Distribution Service.

LC plans to continue to expand MARC until all of LC cataloging (approximately 250,000 titles annually) is encompassed within the MARC system. (Since LC redistributes all changed records and, in addition, each CIP record is updated at least once to a full MARC record, the actual number of records distributed is significantly larger than the number of titles cataloged and included within the scope of MARC at any time.) In certain nonroman alphabets this extension may mean romanization. Equally as important as the bibliographic records is the availability of name and subject authority records. The procedures to input subject records and to maintain the files have been operational for some time. The design of similar procedures for name records, as well as distribution procedures for name and subject records, began in 1974, and it is hoped that in 1975 the library community will have these records for processing in their local systems.

Although the primary advantage of the distribution service is considered to be the cost savings resulting from centralized cataloging and from centralized editing and transcription of machine-readable records, another by-product of MARC is often overlooked. It is impossible to estimate the resources (people and time) saved by national and international organizations implementing automated systems through the use of MARC publications. The LC language and country codes and character sets have been widely adopted, and the various MARC editorial and transcription manuals adapted to local needs. Thus, through the efforts of a dedicated LC staff, significant cost savings have been effected throughout the world.

RETROSPECTIVE CONVERSION, 1968–

With the assurance of an ongoing MARC Distribution Service, libraries throughout the country began to discuss

and, in some instances, to plan the conversion of their existing catalogs. Such uncoordinated conversion activities would result in costly duplication of titles in machine-readable form. Any future amalgamation of the multiple databases into a single unified national database would entail a formidable task of human editing to make the name and subject headings assigned by many libraries consistent with authorized forms.

Since LC was also interested in the conversion of its retrospective records, it appeared timely to investigate the feasibility of a large-scale centralized conversion of retrospective cataloging records and their distribution to the library community.

In 1968 a proposal was submitted to CLR for a feasibility study to be conducted by LC. Recognizing the far-reaching significance of a centralized conversion effort, CLR responded immediately by providing funds. The responsibility for the conduct of the study which was dubbed *Retrospective Conversion* (RECON) was assigned to a working task force. An advisory committee composed of members of the library profession was appointed to provide guidance for the study. Both groups included representatives from LC as well as from other organizations.

A report^[14] published in 1969 described the work performed during the feasibility study and stated the major conclusions reached and recommendations made by the task force. The task force examined in detail: 1) the hardware and software required for a large-scale conversion; 2) existing LC files to select the one most suitable for conversion; 3) the rationale for setting priorities for conversion, and how best to accomplish the job; and 4) the costs of hardware, software, and manpower for a conversion project.

As a result of its investigations, the task force arrived at the following conclusions:^[14]

1. The MARC Distribution Service should be expanded to cover all languages and all forms of material as rapidly as resources and technology allow. There should be no conversion of any category of retrospective records until that category is being currently converted.
2. Conversion of some portion of retrospective records to machine-readable form should be an early goal for library automation efforts.
3. Conversion for a national bibliographic database requires standardization of bibliographic content and machine format. Standards for conversion of retrospective records should be the same as those for current records.
4. The highest priority for retrospective conversion should be given to records most likely to be useful to the largest number of libraries. As nearly as possible, subsequent priorities should be determined by the same criteria.
5. Large-scale conversion should be accomplished as a centralized project. Decentralized conversion would

be more costly and unlikely to satisfy requirements for standardization. The project should be under the direction of the Library of Congress.

Based on these conclusions, the task force recommended that conversion should take place in reverse chronological order, by language, using the LC Card Division record set, which is arranged in sequence by date. Each record would be compared against the LC Official Catalog for updating purposes.

The order of conversion should be: 1) English-language monograph records issued from 1960 to date, 2) Romance- and German-language monograph records issued from 1960 (this conversion would not begin until MARC had been expanded to include these languages), and 3) English-language monograph records issued from 1898 to 1959. Every effort should be made to convert items 1) and 2) within four years.

An initial method of conversion was prescribed and it was proposed that further studies be initiated to determine: 1) the best means of obtaining standard records for items not represented in the LC Official Catalog to build a complete national bibliographic data store, and 2) the feasibility of establishing a national union catalog by recording holdings of libraries in the data store.

The task force further recommended that an implementation committee be established to investigate sources of funds for a detailed system design for a large-scale conversion effort and the initiation of a pilot project to test the proposed conversion system.

The implementation committee was never formed. However, LC took the initiative and proposals were submitted to CLR and the U.S. Office of Education (OE) to augment the resources committed by LC with additional funds required to support both a pilot project and the continuation of the activities of the working task force. Both CLR and OE responded positively and in August 1969 the RECON Pilot Project was initiated, with the additional funds designated for the studies by the task force and the travel expenses of both the task force and the advisory committee.

The pilot project conducted by LC covered five major areas:

1. Conversion techniques postulated in the RECON feasibility report were tested in an operational environment by converting English-language monographs cataloged in 1968 and 1969 but not included in the MARC Distribution Service. (Many of the 1968 titles were formerly distributed to the participants of the MARC Pilot Project in the MARC I format.)
2. Procedures and programs to implement format recognition were developed. (Format recognition is a technique for the automatic assignment of tags, indicators, subfield codes, and fixed fields to machine-readable bibliographic records.)

3. Problems associated with the conversion of records in other languages and cataloged according to other conventions and cataloging rules were analyzed for their effect on a conversion effort.
4. The state of the art of input devices for a large conversion effort was monitored. This included the testing of two devices in a production mode.
5. Microfilming techniques and their associated costs were studied to determine a best method for copying the sections of the LC Card Division record set. Microfilming was suggested because the record set is a "high use" file that cannot be withdrawn in whole or in part for any substantial period of time.

The pilot project continued for two years (August 1969–August 1971) and is fully documented in a report^[15] published in 1972. The findings of the project are briefly summarized below.

1. Format recognition applied to unedited records is a practical computer technique, eliminating the need for human editing prior to keying. The costs for keying and proofing for format recognition remain approximately the same as for processing records fully edited by humans. However, applying format recognition in place of human editing does effect a cost reduction of approximately 12% in manpower costs.
2. The magnetic tape selectric typewriter, currently in use, was found to be as cost efficient as any other off-line device given the requirements for easy accommodation of variable length records and an expanded character set. Cathode ray tube terminals were also investigated for use in an on-line mode for corrections. Only one device was available with the expanded character set. The results of testing direct-read optical character readers (OCR) to convert LC cards to machine-readable form were negative; no device could perform adequately.
3. Filming all cards in a given series of the Card Division record set against a form and reproducing hard copy proved to be the most efficient method of producing source documents. The desired subset of records would then be selected for conversion.
4. Processing of older catalog records and those in foreign languages is more complex than processing current English-language records for books, and therefore conversion costs will be higher.
5. The lowest RECON unit cost that can be anticipated for a record processed by format recognition is approximately \$3.06. (Projected costs were based on the MARC Pilot and Distribution Service experience because RECON was an experiment rather than a production effort. Time was expended on testing devices, alternative methods, etc., and consequently there was no basis for determining accurate cost projections.)

Approximately 58,000 records were converted during the pilot project. The 1969 titles were distributed free of charge to MARC subscribers in 1971 and the 1968 titles were made available through sale.

The most significant technical achievement of the pilot project was the development and implementation of the format recognition process. Automatic identification of the data elements of machine-readable records had been tested in other organizations, namely the Institute of Library Research at the University of California, Berkeley, and the Bodleian Library, Oxford. However, LC was the first to attempt to assign the content designators (i.e., tags, indicators, and subfield codes) and the fixed fields for a full MARC II record by program. The cataloging source data are transcribed from left to right and from top to bottom. (The source document is either an LC-printed card or a MARC worksheet.) The data are input as fields, which are detected by the program because each field ends with a carriage return, and each field continuation is indicated by a carriage return and tab. The title paragraph is the only field where the program is given an additional clue in the form of a delimiter (a special character used to separate units of data) separating the title, edition, and imprint. The format recognition program searches first for the collation statement, which is easily located and always present. Once the collation statement is found and identified, the fields preceding and following collation are analyzed and identified separately using a variety of clues, such as first characters present and punctuation. The first pass of the program provides gross identification (in most instances only a partial tag is provided) and the remainder of the process is a reexamination of each field to provide final and complete tags, indicators, and subfield codes. After each variable field is fully identified, the data are scanned for information required to set the fixed fields. Tables of keywords consisting of items such as U.S. cities, foreign cities, geographical names, meetings, and honorary titles associated with personal names are used for matching purposes to aid in the identification of a variable field, or a data element within a field, as well as providing, in some instances, the information needed to fill in a fixed field.

Format recognition is currently used for the processing of English- and French-language monographs. Additional keyword lists will be built for other languages as the MARC service is expanded. The program has been operational since May 1971. RECON records were processed to test the technique in a production environment until January 1972. At that time, satisfied with the results, LC proceeded to use the technique for the processing of current MARC records.

Concurrent with the RECON Pilot Project, the task force considered certain basic issues of retrospective conversion that were of national scope. The studies, with conclusions and recommendations, were reported in a publication^[16] in 1973. Underlying all the work performed

was the reaffirmation of the importance of a coordinated retrospective conversion activity to keep duplication of effort to a minimum and to achieve a high degree of compatibility among records.

The special studies involved four areas that are described along with the findings of the task force.

1. There have been many attempts made and a great deal of effort expended to determine a subset (hereafter referred to as level) of the MARC format that would still allow a library using it to be part of any future national network. A level of a MARC record can be distinguished by differences in: 1) the data content of a record, and 2) the extent to which its contents are separately identified. Upon agreement as to the use to be made of machine-readable cataloging records, two or more parties can define a level of the MARC format to satisfy that use. The task force was concerned with the creation of machine-readable records for national use, i.e., either the recording of holdings to a national union catalog or the distribution of cataloging information in machine-readable form to library networks, systems, or individual institutions. The task force concluded that level of MARC records can be defined for each of these functions. Since the union catalog function is well defined, a level of less completeness than the full MARC could be determined. However, the record for the distribution function must satisfy the needs of diverse installations and applications and, consequently, must be the fullest MARC record.
2. A large pool of machine-readable bibliographic records exists. Since MARC is still limited in its coverage, there is the potential of using this pool of records to accelerate the building of a national database and to reduce the duplication of input with a resultant cost savings. The task force undertook to investigate representative machine-readable databases and to assess their potential for this purpose. The study indicated that the per record cost of converting non-MARC records to MARC, comparing them with the records in the LC Official Catalog (to ensure consistency and completeness), and updating their contents, approached the per record LC/MARC cost. However, if the record was similar to an LC/MARC record in terms of fullness of catalog entry, format, and character set, i.e., a high potential record, then comparing only its access points with the LC Official Catalog record and updating those access points when required, would result in a conversion cost estimated to be in the order of one-half of present LC/MARC conversion costs.
3. The National Union Catalog (NUC) serves two major functions: the provision of cataloging data and a finding list for the locating of a title. With the advent of LC/MARC and the proliferation of library automation projects, it was logical for the task force to consider the implications of a national union catalog in machine-readable form. On-line access to a national union catalog did not appear to be likely in the near future. Attention was consequently turned to the automatic production of the NUC in book form or microform. This mode of production would relieve humans of the drudgery of preparing the catalogs, make the information more rapidly available, and provide the facility for additional access points to the data. The task force selected the register/index as the optimum format for NUC. This type of catalog is composed of a register of complete bibliographic entries arranged in numeric sequence according to a number assigned to each entry when the register is prepared. The register is never cumulated. The indexes are derived from the register entry and contain a brief bibliographic entry and the register number. The indexes are cumulated at predetermined intervals. This format has the advantage of providing several points of access without having to print the full bibliographic record more than once. The task force concluded that the cost of the automated system with its associated advantages would not exceed the cost of the present manual system, and the cost of producing the quinquennial would be significantly reduced. In addition, the database might eventually form the basis for an on-line network of regional bibliographic centers.
4. Experience in the RECON Pilot Project indicated that a large-scale conversion project as projected in the RECON feasibility study demanded far more resources (staff, space, and funds) than there is hope of obtaining. To convert chronologically by language as recommended in the feasibility study, on a lesser scale, would be too slow to satisfy those libraries requiring machine-readable records for their automation efforts. Therefore, the task force examined alternative strategies, hoping to arrive at a means of more rapidly responding to the needs of libraries, but concluded that there was no perfect solution to the problem, since preferences for languages, dates, and forms of material are dependent on the type and size of library involved. Systematic conversion, i.e., orderly conversion by language and date, has the advantage of allowing the user to predict with reasonable certainty what is in machine-readable form. It has the disadvantage that users may wait for long periods of time before desired records may be available. Conversely, nonsystematic conversion (based on some criterion such as all records in a given bibliography) might have the advantage of more rapidly converting records desired by a larger number of organizations, but it would have the disadvantage that, without querying the database, the user cannot predict which titles are in machine-readable form.

The task force concluded that LC should concentrate on going forward as rapidly as possible to convert all of its current cataloging to machine-readable form and that an agency, established expressly for the purpose of a large-scale retrospective activity, should undertake to convert the retrospective LC records that are most in demand and be responsible for adapting records from libraries other than LC for inclusion in the national database. (Initially, these records might be those ordered from the LC Card Division most frequently.) The task force recommended that since the problem of retrospective conversion is of concern to all of the nation's libraries, the National Commission on Libraries and Information Science (NCLIS) might be the appropriate agency to determine a course of action and explore sources of funding to implement a national program.

To date, no central agency has been established nor has NCLIS taken any express action concerning retrospective conversion. LC, when resources permit, continues to convert retrospective titles selected from the Card Division as well as MARC Pilot records that were not converted during the RECON Pilot Project. (The MARC Editorial Division, responsible for the conversion of MARC records, is geared to peak load conditions. When the volume of records diminishes for any period of time, the gap is filled in by converting retrospective titles.) These records are distributed as part of the MARC service.

There is continuing interest in a centralized conversion activity. The concern of the participants in a series of meetings^[17] sponsored by CLR is one manifestation of this interest. The purpose of these meetings is to seek a means of exchanging machine-readable records among organizations until such time as a national service may exist to perform this function centrally. The records under consideration are of two types: 1) records converted from LC cataloging copy not included in the MARC Distribution Service (i.e., either items cataloged prior to the MARC service for a particular language or form of material or records not yet within the scope of MARC), and 2) records representing titles not cataloged by LC. The emphasis here is placed on all records, both retrospective and prospective, being converted by organizations other than LC. As progress is made on the automation projects of individual institutions and as regional networks evolve, it is an accepted fact that institutions will be doing local conversion. The excessive cost of duplicate conversion that will result if machine-readable data are not shared, as well as the problems of an inconsistent data base, can only be resolved if a single organization assumes the responsibility and has the resources for building a national data base.

INFLUENCE OF MARC ON STANDARDIZATION

Libraries acknowledged the importance of standardization long before MARC came into being. Machine

systems, however, showed the need for an extra measure of conformity over what had been apparent in the past. What appears in the printed record is human readable, not bit configurations representing characters or codes or explicitly identifying content data. Variations in the placement or the formatting of words, paragraphs, and numbers in the printed record are not too damaging to the initiated, but can be intolerable to efficient machine processing. The interest of libraries in the computer for library operations was increasing in the 1960s. The availability of cataloging data in machine-readable form supplied by LC, the need to input cataloging data locally (data not within the scope of MARC or titles not cataloged by LC), the possibility of sharing these locally generated records, the potential for using computer programs across organizations to reduce the high cost of designing and writing software, and the need for hardware capable of handling large character sets were all factors that put increased emphasis on the establishment of and conformity to standards.

The impetus given to standardization by LC/MARC is doubtless one of its most important results. The establishment of bibliographic standards did not happen chronologically but in many instances overlapped, i.e., the development of a new standard might begin while a proposed standard was in the process of adoption. Consequently, reporting of the standards cannot be made in strict chronological order.

Format for Information Interchange

During the operation of the MARC Pilot Project, BNB personnel visited LC to investigate the possibility of a UK/MARC Pilot Project. At a later date, when BNB decided to proceed with its MARC project, its staff worked with the MARC staff on the MARC II format in an effort to satisfy the requirements of both agencies. This cooperation had long-term effects. Both agencies recognized the future implications of an interchange format and the importance of two major publishing countries agreeing on a standard. Not only would it be possible to exchange machine-readable records between the United States and the United Kingdom, but the way would be open for other countries to follow the lead and develop their own MARC projects. This possibility was particularly interesting to LC because of NPAC, where LC uses the descriptive cataloging as given by other countries in the program, adding or modifying main and added name entries, subject headings, etc., to the record as necessary. The entire process is a manual operation using printed records. The potential exists for updating machine-readable records from countries in the program and thus reducing the cost of conversion at LC.

Recognizing the worldwide impact of sharing machine-readable records, LC and BNB, in addition to being active in their respective national standards organizations, in

1969 submitted the then proposed American National Standards Institute (ANSI) format and its equivalent, the proposed British Standards Institute (BSI) format to the International Organization for Standardization (ISO). The MARC projects in the United States and Great Britain and the developing ANSI, BSI, and ISO standards created the environment for many countries (including Australia, Canada, Denmark, France, Germany, Italy, Japan, Latin America, Norway, and Sweden) to begin to plan for and implement their own national MARC system. (In addition to national libraries and bibliographies, many organizations based outside of the United States, such as UNISIST, the International Labor Organization, Information Services in Physics, Electrotechnology, Computers and Control, and the International Atomic Energy Agency, have adopted or recommended adoption of the format structure.)

The MARC format *structure*, as a vehicle for information interchange, was adopted in the United States by the three national libraries, ALA, ARL, the Committee on Scientific and Technical Information (COSATI), the Educational Resources Information Center (ERIC), the Association for Scientific Information Dissemination Centers (ASIDIC), and others. The format structure became an ANSI standard in 1971^[18] and an international standard in 1973 [ISO 2709–1973 (E)].^[19]

International Standard Bibliographic Description

In 1969 the International Federation of Library Associations (IFLA) convened an International Meeting of Cataloguing Experts. Since the Paris Principles had set the framework for an international cataloging code, it seemed appropriate to call an international meeting to discuss the next step, a standard bibliographic description. A working paper^[20] prepared by Michael Gorman of the BNB, with the support of a United Nations Educational and Scientific Organization (UNESCO) grant, demonstrated the difference in the order of data and in punctuation patterns of various national bibliographies (NUC represented the United States bibliography). A working party was selected to draft an international standard bibliographic description for monographs. An international standard bibliographic description would provide a standard set of descriptive elements in a standard order using standard punctuation to separate the elements. Such a description would facilitate: 1) the comprehension of the description in printed form regardless of language, and 2) the automatic recognition of elements of the description for machine identification. The first published draft of the International Standard Bibliographic Description (ISBD) was issued in 1971, followed by the first standard edition in 1974.^[21] [A recommended ISBD for serials was also published in 1974.^[22]]

Content Designators

The ISBD for monographs, the ISO standard format structure for bibliographic interchange, Kaltwasser's paper^[23] concerning universal bibliographic control, and the ever-increasing number of national MARC formats were all positive steps toward international cooperation. Problems remained, however. One of the significant areas of nonstandardization among national MARC formats was in the assignment of content designators to elements of information in the machine-readable records. Accordingly, IFLA established, under the auspices of the Committees on Cataloguing and Mechanization, an international Working Group on Content Designators. The Working Group held its first meeting in Grenoble, France, during the 1973 IFLA conference. Obstacles in the way of agreement on content designators include: 1) diverse functions of the bibliographic agencies, 2) lack of an internationally accepted cataloging code, 3) lack of agreement among different bibliographic communities on organization of data content in machine-readable records, and 4) lack of agreement as to the functions of content designators.

The Working Group realized that the issues concerning data organization and functions of content designators could be resolved (subsequently agreement on these points was reached in a meeting in Brussels in February 1974) but that the lack of an internationally accepted cataloging code and the dissimilarities in the functions of different bibliographic services were areas over which it had no control.

Encouraged by the fact that it has been possible to work around these differences in the formulation of the ISBD, the Working Group proceeded to adopt the concept of a SUPERMARC^[24,25] as an international system for exchange, leaving the various national systems as they now exist. Each country would have an agency that would translate its own machine-readable records into the format of the SUPERMARC system; likewise, each agency would translate SUPERMARC records into its own national format.

The international machine-readable record was divided into functional blocks (e.g., intellectual responsibility block, descriptive block, subject block). There was unanimous agreement that the descriptive block would follow the ISBD, and it is this block where agreement on content designators and content is most likely possible.

It is recognized that the content and consequently the content designation of certain blocks is dependent on cataloging codes and practices. Therefore, the best that can be hoped for in the near term is agreement on content designation at a level of specificity less than that presently used by national systems. For example, the intellectual responsibility block contains names of persons and organizations associated with the work described. In national systems, each type of name may be further expanded to multiple levels of subtypes and subfields coded in a variety of ways. In the international record, the expansion may

be limited to indicating personal, family, corporate, and conference names; and primary, alternate, and secondary responsibility.

The concept is a record composed of two principal parts: 1) the identification of the item (descriptive block modeled after the ISBD), and 2) all other elements making up the bibliographic record, e.g., headings, subjects, and classification numbers. This will allow the user to accept the descriptive block for inclusion in his system and provide the option of using or discarding the other elements of information.

Work on this international standard is still underway. It is hoped that agreement will be reached on a standard set of content designators by the IFLA meeting in 1975.

Other Activities

The expanded roman-alphabet character set designed by LC was adopted by ALA, has been used in information systems throughout the world, and is the basis for the current work in progress in ISO/TC46/SC4/WG1, Character Sets for Documentation and Bibliographic Use. The acceptance of a character set for bibliographic use, indicating marketability to hardware vendors, led to the manufacture of a typewriter sphere, a print train, and several cathode ray tube terminals.

Country of publication codes and language codes originally established by LC for the MARC Pilot Project and, based on experience, modified for the MARC Distribution Service have also been accepted as the codes for several systems. Although these codes have not been adopted as ANSI or ISO standards, they do have an impact on current standardization activities.

The challenge to the individuals involved in standards setting is great. Much remains to be accomplished. Progress has been made, however, and it appears that "International MARC" may become a reality.

MARC USERS

Use of MARC at the Library of Congress

The main thrust of LC's bibliographic automation program during the years 1966–1970 was the distribution of MARC data. In terms of LC, MARC up to 1974 covered approximately 40% of LC's total cataloging effort.

In 1970, sights began to turn inward, and MDO was established in the Processing Department to concentrate on automating the functions concerned with technical processing. (Before June 1970, staff responsible for MARC, RECON, etc., was part of the Information Systems Office (ISO), organizationally situated in the Office of the Librarian. At the same time that MDO was established, ISO was transferred to the Administrative Department.) An article describing the automation

programs of the Processing Department was published in 1972.^[26] The program can be considered to have a three-pronged approach: 1) expansion of the MARC Distribution Service, 2) design and implementation of a core bibliographic system,[†] and 3) products and services for LC and the library community. It is principally in item 3) that the MARC data base is used at LC at this time. Several of these projects are briefly described below.

Book Catalogs

1. The Main Reading Room catalog consists of records included in MARC (books and serials) and records input especially for the project. Catalogs have been produced, via computer printer, arranged by call number, author, title, and subject for use in LC. Plans include the general distribution of the catalogs in this form as well as photocomposed issues at a later date.
2. The Science Reading Room file is also composed of MARC records (books and serials) in addition to records input specifically for the project. Computer-printed catalogs have been produced for use in LC.
3. The catalog of *Films and Other Materials for Projection* for the last quarter of 1972 and the first two quarters of 1973 was produced from the MARC films database in 1974. This catalog is issued in two sections in one volume: 1) title main entries and added author entries, and 2) subject added entries. "See" and "see also" references are included.

All machine-produced book catalogs and other bibliographic listings are arranged by means of a program called Library Sort Key Edit (LIBSKED). This program was designed to implement the new LC filing rules^[27] formulated by the Technical Processes Research Office of the Processing Department.

Printed Cards

MARC records are input to the Card Division's automated system to compose and print LC cards, complete with overprinted headings, for use in the LC catalogs. On-demand production of cards for film and map titles in response to orders from subscribing libraries or for cards that are out of stock is operational, but on-demand production for all orders (approximately 40,000 per day) for which there is a MARC record cannot be implemented until quantity limitations imposed by the present capabili-

[†]This includes automation of the Order Division functions and the Process Information File (PIF) which are presently in various stages of operation, implementation, and design. The Core Bibliographic System includes the use of LC name and subject authority records to produce book catalogs as well as linking them to MARC records as a cataloging aid. Several ongoing operational projects, such as the building and maintenance of the subject heading file, are modules of this activity.

ties of the offset press and accompanying cutting and collation equipment are resolved. Consequently typeset cards are still being prepared for MARC titles through the Government Printing Office.

MARC Retriever

The MARC database is being used more and more frequently in LC as a bibliographic reference to supplement the card catalogs. The machine-readable records provide access via fields not used as headings in the card catalogs, and the richness of the MARC format offers new possibilities for the retrieval of information.

The MARC Retriever was originally seen as a research tool to promote the use of the MARC data base in new and unexplored ways. This experimental mode is still of interest in LC but, in addition, the system is used operationally for many purposes in LC as well as to provide special searches to outside organizations. The Retriever allows the user to search the contents of any variable field, subfield, or fixed field, as well as any specific tag, indicator, or subfield code value.

Recent searches include: 1) monthly lists of books on Africa, Mainland China, Latin America, Eastern Europe; 2) books in translation; 3) children's books in translation; 4) serials in French published in France, Belgium, and Canada; 5) railroad maps; 6) maps of East Africa, Kenya, Tanzania, and Uganda; 7) CIP records in history, LC class schedules E and F; 8) Festschriften; 9) atlases published in 1972; and 10) books about Africa containing statistical information.

The records retrieved are arranged and printed according to the user's specifications. The sort may be on author, title, subject, classification, date, etc. Output may be printed in card or list form, with the amount of information displayed (short form or full record printout) a user option.

Other Uses in LC

The LC Division for the Blind and Physically Handicapped selects pertinent records from the MARC files for inclusion in its system for the production of bibliographic tools, e.g., printed cards and book catalogs for such items as talking and braille books.

As the scope of MARC expands and as the ongoing projects such as the automation of the PIF become operational, more and more use will be made of MARC at LC, both for technical processing and reference.

MARC is now searchable on-line by LC card number within LC. Access to the file will be expanded to include author/title and title only search keys. Preliminary catalogers will be able to search the MARC file as well as the PIF to determine whether the item in hand is already in the collection or requires cataloging; the Card Division will be able to search for titles for which printed cards were ordered but for which the LC card number was not given; and the Catalog Publication Division will be able to search

for items reported by NUC libraries to ascertain if the reporting record is a title already covered by LC cataloging so that holdings can be posted to the proper record.

Plans include making the MARC file accessible by the Reference Department and expanding searching capabilities, as well as the eventual two-way linking between the authority records (name and subject) and each bibliographic record where the name or subject or both were used. This linking will enhance the present book catalog production system as well as provide the means to use the MARC files as a cataloging aid.

Use of MARC by Subscribers

At present (March 1974) there are 74 organizations subscribing to the MARC services. (The last MARC Survey was conducted in the spring of 1972 and the results published later in that year. The subscriber figures cited in this section have been updated to reflect the current situation.) The 74 subscribers purchase the following subscriptions:

MARC, Complete	13
MARC, Books (All)	28
MARC, Books (English)	19
MARC, Films	4
MARC, Serials	12
MARC, Maps	3

This list can be further subdivided within the category MARC, Complete. For example, there are 13 complete subscriptions and three map subscriptions, meaning that 16 map subscriptions are actually in force. Dividing the subscriptions in this manner results in the following:

Books, Foreign	41
Books, English	70
Films	17
Serials	25
Maps	16

Since an organization may order more than one type of service, the actual number of individual subscriptions as given above total 169. The subscribers are made up of 18 commercial enterprises, 23 organizations outside the United States (one of these has been previously counted with the commercial enterprises), and the remainder divided among large research, college and university, state, special, and national libraries and library centers. Institutions are difficult to identify accurately since any one institution may perform the functions of another type, e.g., a university library may act as a center, serving, in

addition to itself, several other organizations. Therefore, it is not possible to derive an accurate tally of subscribers by type of library. The subscribers discussed above are considered primary users. All of the commercial vendors and library centers as well as some of the organizations in the other categories of users provide services to other institutions. These latter institutions are considered secondary users of MARC data and, according to LC's best estimates, total approximately 1500.

There are difficulties inherent in any presentation of MARC uses. This difficulty is in part created by the tendency of library functions to overlap. For example, the search/select function is not an end unto itself but instead may be a component of a system to print catalog cards or of an SDI system. There are also various levels of the use of MARC data, depending on the mix of manual and automated processing. MARC records are, in some cases, simply used as a source of bibliographic information with the rest of the processing purely manual, or MARC records become an integral part of an automated system. Some systems are wholly dependent on MARC; in others, MARC is some percentage of the total database. There are systems that are totally batch oriented, others are partially batch oriented and partially on-line, and still others operate principally in an on-line mode. These various differences in systems do not affect the function performed, e. g., looking up a title to find where it is located, regardless of how the system is designed or how the files are organized.

The following discussion of MARC uses attempts to avoid the problems described by addressing MARC uses in general terms and not probing into individual systems.

The majority of uses of MARC data fall into the technical processing area. This is not surprising, since before the reference function can be served adequately, items must be put under bibliographic control. Furthermore, it is in technical processing that the professional librarian needs to be relieved of performing repetitive tasks or supervising others in the performance of such tasks. However, the reference function is somewhat satisfied by SDI services, LC's MARC Retriever, and the searching of index files of author, title, and subject.

Current MARC tapes are used for selection purposes by printing out the records and routing them to persons responsible for selecting materials for acquisition, or by comparing the tapes against stored profiles and printing the records that match. Printed indexes are also prepared from the MARC files (weekly or cumulative) and made available for selection.

To the extent that MARC records are available for items to be ordered, manual bibliographic searching is eliminated, and the MARC records selected are used to produce the orders and associated documents and the records are added to the institution's in-process or master file.

MARC records are used in the production of catalog cards and book form catalogs. Book catalogs have appeared in dictionary form, register/index form, or as separate author, title, and subject catalogs (or any combination thereof). The level of sophistication of catalog production varies greatly. The production forms include computer line printing, photocomposition, and microform.

A bibliography in microform, called *Books in English*, is produced by merging BNB/MARC records with relevant LC/MARC records. A catalog of English-language acquisitions of a university library and affiliated institutions is also produced by selecting appropriate records from these two databases.

Shared cataloging systems with access to LC/MARC and locally input cataloging records by LC card number and/or search keys are also in operation. (The Ohio College Library Center is the most advanced system at this time providing this type of service.) Member libraries search the files for a specific record. If the record is in the file and if the cataloging data is acceptable to the institution, printed cards in the format and quantity desired by the institution are sorted (prearranged in a filing sequence) and prepared off-line for the selected record. If the record is not available, the member library inputs the locally cataloged record that then becomes available to all other participants and the printed cards are prepared from the locally input record. In some systems, records can also be output on tape for any library desiring its cataloging data in machine-readable form. The on-line posting of the locations of the requesting library and the use of this file for interlibrary loan is also in operation.

The production of catalog cards remains the most popular operation, although in many instances card production is not the *raison d'être* of the system. The production of book preparation materials (bookcards, pockets, and spine labels), as well as circulation cards, is a useful by-product of some systems.

In one system the MARC record is used as a bibliographic source, and agency subject terms, call numbers, etc., are added. The entire MARC file is maintained as a composite database, and a subset of the file relevant to the specialization of the organization is selected by such criteria as LC class numbers or subject headings, added to the records in the system not included in MARC, and both types made available on-line to participating libraries. A full free text search is provided with a modified Key-Word-in-Context (KWIC) display for titles, series names, conference names, corporate names, publishers' names, and subject headings. Additional on-line searching capabilities include other names, LC call numbers, LC card numbers, international standard book numbers, Dewey Decimal numbers, local library card numbers, and local library location indicators. This sophisticated searching capability is in addition to the production of several library products, e.g., current awareness listings and book catalogs.

CONCLUSION

MARC is an assemblage of formats, publications, procedures, people, standards, codes, programs, systems, equipment, etc., that has evolved over the years, stimulating the development of library automation and information networks.

Any discussion about MARC in particular involves discussing library automation in general. Progress in the field is evident. There is a definite advance from the automation of discrete functions toward the automation of modules leading to integrated systems. Emphasis is being placed on the implementation of on-line systems and the use of one system to provide services to many other organizations.

Library automation activities in 1974 appear to fall into the following categories:

1. Institutions are automating their technical processing functions and, as a by-product, providing services, e.g., cards and listings, to other organizations.
2. Institutions are automating a particular aspect of their service, e.g., book catalog production, and as a by-product their procedures and programs are used to produce a like product for another organization.
3. Institutions are creating automated systems designed principally as a bibliographic center to provide services, e.g., printed cards and union catalogs, for other organizations that do not intend to automate.

Libraries have passed through an era of much talk but few results into the 1970s where the automation of library operations is no longer a promise but a demonstrated success. Faced with economic realities, the availability of bibliographic information in machine-readable form and the possibility of sharing these resources through computer technology, there is an increasing awareness that standardization, nationally and internationally, is the sine qua non of the information system.

The benefits that accrue to a library and its clients from the establishment of and the conformity to standards are many. Products from different sources will mesh. Records from different libraries will be interchanged. Machine systems will be more easily developed and shared. Union catalogs will be possible without costly editing for consistency, thus facilitating interlibrary loan. Cost of local changes to catalog records will be minimized. It will be advantageous for vendors to manufacture hardware to handle the requirements of libraries. The process of ordering, cataloging, etc., will be more uniform. Therefore, less searching and bibliographic verification will be necessary and duplication of effort will be avoided. Networking will be facilitated. Various databases will be accessible through the use of standard protocol. Service to the user will be improved, and that is really what MARC is all about.

Machine Readable Cataloging (MARC): 1975–2007

Sally H. McCallum

Network Development and MARC Standards Office, Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

This entry describes the development of the MARC Communications format. After a brief overview of the initial 10 years it describes the succeeding phases of development up to the present. This takes the reader through the expansion of the format for all types of bibliographic data and for a multiple character scripts. At the same time a large business community was developing that offered products based on the format to the library community. The introduction of the Internet in the 1990s and the Web technology brought new opportunities and challenges and the format was adapted to this new environment. There has been a great deal of international adoption of the format that has continued into the 2000s. More recently new syntaxes for MARC 21 and models are being explored.

The Machine Readable Cataloging (MARC) format, developed in the late 1960s as an electronic carrier of traditional library cataloging data, became the cornerstone for the transformation of library catalogs from card to computer and for a new era of shared cataloging, union catalogs, and integrated systems in libraries. Today it is used around the world, with new users still joining its data exchange environment, even as the basic structure of the format is being brought forward into new models.

This entry sets the context with a short review of the initial development of MARC, highlighting its innovative design and advanced character set developments. The period of expansion of the format, of character sets, and of implementation options and systems are described. With the 1990s, the Internet, Web, and Unicode presented new challenges for the format's user community with many process changes. The convergence on MARC 21 internationally is described followed by recent developments in syntax variation and modeling. A more detailed history of the format is found in McCallum.^[1]

MARC DEVELOPMENT PERIOD

In the early 1960s, libraries in North America and in Europe began to experiment with the application of the computer to library processes. This was at the beginning of the computer explosion which was fueled by the introduction in 1964 of the IBM 360—the machine that brought computers out of the universities and research labs and into the business world. It was an environment of large mainframe machines. It was before the personal computer, and even before common deployment of cathode ray tube terminals and networking of installations. For more detail on the MARC 21 development period see Henriette D. Avram's classic article "Machine-Readable Cataloging (MARC) 1961–1974" reprinted in this edition

of the *Encyclopedia of Library and Information Sciences*. It contains an excellent detailed description of the format development process from the 1960s through the early 1970s and an extensive bibliography. The following section is only a brief overview of that period, which provides the context for later developments described in this entry.

MARC Pilot Project

Following several investigations of the potential uses of computers in libraries,^[2,3] the MARC project was launched by the Library of Congress in January 1966 with a focus on getting cataloging data that had been typed onto cards for decades, into computers from which multiple forms of access could be provided. The project had to work with several unique characteristics of bibliographic data. One involved lengths. In the 1960s fixed length data formats were standard, yet bibliographic data elements could vary considerably in length. Titles alone could be one character to hundreds of characters long; descriptions that might be detailed or brief created great variation in the content size of records; and files of records could be quite large, requiring records for descriptions of millions of items in larger libraries. In addition, flexibility was needed as records were often updated and different subsets of the data in the record were used for different applications that the records had to support—circulation, finding, requesting materials from stacks, acquisitions. At a more microlevel, was the need to accommodate data in many languages, including some transliterated from non-Latin scripts, and that required several special alphabetic characters and many diacritics that were not in the standard Latin alphabet ASCII character set. ASCII is a basic Latin alphabet set. It contains 94 graphic characters including upper and lower case Latin alphabet letters A–Z, numbers 0–9, common punctuation marks, and a few symbols. It

was first approved as an American National Standard in 1968.^[4]

The MARC pilot project was carried out from 1966–1968, led at the Library of Congress by an early computer expert Henriette D. Avram, who had been a programmer at the National Security Agency where computers were essentially developed in the 1950s. The pilot involved 16 libraries of various types—universities, research institutes, and public. The focus of the pilot was to develop a format for the bibliographic record that would enable the distribution of cataloging data in machine-readable form via magnetic tape from the Library of Congress to libraries across the country.^[5] By the end of the pilot, the structure and basic data tagging for an initial MARC format were drafted and testing had begun.^[6–8] Within a few years as networks and terminals became viable, several of these early pilot participants and institutions became important figures in advancing library automation using the standard MARC record, including Yale's Frederick Kilgour who moved to Ohio and founded the OCLC bibliographic network, and the Universities of Toronto, Washington, and Columbia that led the founding of the UTLAS, WLN, and RLG networks, respectively. The OCLC was originally named the Ohio College Library Center, but as it became national in the 1980s and global in 1999, changed its name to Online Computer Library Center; RLG was the Research Libraries Group that grew out of a consortium of Harvard, Yale, Columbia University and New York Public Library and was merged with OCLC in 2006; WLN was originally the Washington Library Network in Washington state, which became the Western Library Network as it expanded and was finally absorbed into OCLC in the late 1990s; and UTLAS was originally the University of Toronto Library Automation System, which was purchased in the 1990s by Auto Graphics Canada. Not only was cataloging shared through these networks but large union catalogs were built from the cataloging activities that supported growing national and international interlibrary loan programs.

MARC Character Encoding

The MARC pilot project also spearheaded development of an extended Latin alphabet character set to be used to supplement the standard ASCII characters for MARC data.^[9] The set was characterized by its content model that encoded diacritics separately from the base character that they modified, depending on display devices to position the diacritics correctly. Precomposed characters were not feasible for library data since the combinations that occurred in large libraries's multilingual data were both extensive and not always predictable. The Library of Congress worked with the computer industry on devices for displaying and printing the extra characters and diacritics correctly, with mixed success, since most computer devices only handled precomposed alphabetic character

and diacritic combinations. The extended Latin character set eventually became an ANSI standard: *Extended Latin Alphabet Coded Character Set for Bibliographic Use* (ANSEL) (ANSI Z39.47).^[10]

MARC Features

Briefly, the MARC format structure is composed of a short introductory fixed length (36 byte) segment, called the Leader; followed by a Directory giving the tag, length, and starting character position of each of the record's data content fields; followed by the data content fields themselves. The innovative features of the MARC format structure that supported the characteristics of the MARC record indicated above were the following.

The information in the Leader made the format self-defining. It included the record's length, which meant a record was not constrained to fixed lengths as was common at the time. If record content was brief, the record was brief, thus the size of the total file was no larger than necessary. The Directory was a "table of contents" and avenue into the record that enabled variable length data content fields within the record—a title field for a one character title was only one character long. It allowed easy addition or deletion of fields, and it enabled rapid access to fields needing update or to subsets of fields needed for a specific application.

The data content fields were identified by tags in the Directory and are further defined by two positions at the beginning of each, called indicators, and by subdivision of the data into specifically identified subfields within a field. The tagged fields, indicators, and subfield structures enable the format to be responsive to the need in library applications to carry and identify highly parsed, structured data, show relationships among data, and even assist with sorting. Fields and subfields easily accommodate the many different data elements needed to describe special aspects of diverse types of resources (Fig. 1).

The innovative structure for the MARC record became first an American standard, *Information Interchange Format* (ANSI Z39.2)^[11] in 1971, and then an international standard, *Format for Information Exchange* (ISO 2709)^[12] in 1973.

The MARC format was developed as an exchange format, without the expectation that it would also serve as an internal format for systems serving end users. Exchange has essentially been its use over the years, but with some qualifications. The way data elements are parsed is important to preserve when passing data to an internal format, so that the parsing can be reconstructed when the data needs to be transformed into MARC again for communication to another system. Therefore internal systems have tended to retain some aspects of the record since data is transferred so frequently. The MARC content designation (tags, subfields, indicators, coded data) also became vocabularies that catalogers learned across the library community,

Fig. 1 Record for the book *The dressmaker* by Elizabeth Birkelund Oberbeck, published in New York by Henry Holt, and Co. in 2006. The record has a link (via a URL) to a description of the book supplied by the publisher. Complete MARC 21 record (author, title, edition, and publisher part in bold): (Graphic substitutions: # for blank; \$ for subfield identifier; % for end of field character; @ for end of record character).

becoming a *lingua franca* for the discussion of record components. The metadata-rich MARC record contains data to support indexing and other functions, in addition to end-user displays, thus the communications record continued in the terminal and personal computer eras to be important for interchange between systems.

MARC FORMAT FAMILY AND SYSTEM DEVELOPMENT

After the initial implementation period of the 1960s and early 1970s the MARC format underwent dramatic development and up-take in the late 1970s and early 1980s. The advances in the technology for online systems and access were the catalyst. By 1975, roughly 60% of the records produced annually by the Library of Congress were available as MARC records, with the number increasing rapidly as format requirements for new forms of material were implemented.

Family of Formats

By the mid-1970s the MARC Bibliographic format^[13] was a suite of coordinated specifications for not just books but also serials, maps, films, music, sound recordings, and manuscripts. The next advance was development of a format for records for the standardized forms of names and for subject thesauri that appear in bibliographic records, the MARC Authority format.^[14] Then in the early 1980s, there was interest in integrating holdings and other data into library catalogs. Thus the MARC Holdings,^[15] MARC Classification,^[16] and MARC Community Information^[17] formats were developed by special interest groups. The Holdings format contains sufficient detail to indicate to a user the volumes and issues of a serial held by

an institution and to support serial check-in systems that needed to predict expected issues and generate claims for serial issues that are overdue from the publisher. It is a companion to the bibliographic format, and in fact was developed according to a model that allows the holdings data to be contained in separate holdings records or embedded in bibliographic records. The Classification format supports the online transmission and use of common classification schedule files, including the Library of Congress Classification and the Dewey Decimal Classification. The most unusual format was the one for community information data, which allows a library to integrate information about public events and community services into a bibliographic database. It was used in public library settings but Web sites have largely replaced it for that original purpose.

With the auxiliary formats completed, a review of the Bibliographic formats for the various forms of material took place in the late 1980s, when the Bibliographic format had just reached 20 years of use. While the core data elements of each bibliographic type, such as names, titles, and publishers had been kept consistent across the Bibliographic formats, they also contained many data elements that were “form of material specific.” After extensive discussion with the user community, the Bibliographic formats were integrated into one, eliminating earlier designations of field validity by type of material. This new freedom and flexibility enabled the format to be more readily responsive to changes in resource media and technology, especially for accommodating the description of electronic and modern multimedia material. At the same time some simplification of the format was attempted, although the main counter to any simplification was and is the persistent need to parse and structure bibliographic data in order to support complex and diverse retrieval options for systems and, ultimately, end users. Libraries serve a varied clientele and while a majority of their end users may not have complex needs, librarians provide services to both the generalists and specialists.^[18]

Record Use and System Developments

In the 1970s, with a known data standard and a critical mass of bibliographic records in that standard, libraries first experimented with producing focused automated systems that took the records and used them, for example, for card printing, circulation control, book catalog printing, book preparation (binding labels, book pockets, etc.), or current purchase awareness lists. The bibliographic networks mentioned above, OCLC, RLG, WLN, and UTLAS, were established to facilitate record sharing and build union catalogs that they used to support automated interlibrary loan. The Library of Congress achieved a distribution service for all of its cataloging records and its related subject and name authority files in MARC format, while also developing an internal online catalog. By 1980,

several other libraries had developed online catalogs and during the 1980s, the local system development that started in the previous decade led to widespread availability of vendor software for library processing and online catalogs.

The success of a few vendors of bibliographic systems attracted more development, until the marketplace offered large and small systems with a variety of differences and special features—and a broad price range. The MARC communications format provided a record rich with data that system engineers used for innovative applications, retrieval programs, and user interfaces, but it did not dictate internal system design. MARC data within a system will usually be carried in an internal format or configuration that is efficient for the system hardware or platform, but highly compatible with the communications format. Inevitable transitions from a locally developed system to a vendor system or from one vendor system to another would take place over the next decades in libraries, but this migration has been eased by the standard data format all systems could export and import.

As more libraries obtained online catalogs, interest turned to retrospective conversion of older bibliographic data. Libraries wanted to consolidate all holdings in a single online catalog and retire their card catalog. Thus many retrospective conversion projects were undertaken in the 1980s resulting in an explosion of records in the automated bibliographic “universe,” and in particular, in union catalogs like OCLC and RLG. Even the Library of Congress undertook the conversion of its retrospective file of over 5 million records, a project that had been explored by the Avram team beginning as early as 1968.^[19] While early conversion of the Library of Congress’s very large catalog could have been valuable to later conversion projects of the nation’s libraries, the bibliographic networks contributed greatly to reducing the cost of later conversions by making the records converted by one library available to other libraries.

Character Set Expansion

In the 1980s, MARC also went beyond the initial Latin character sets when one of the major networks, RLG, developed a MARC-based bibliographic system that allowed input and search of data utilizing standard character sets for Arabic, Cyrillic, Chinese, Greek, Hebrew, Japanese, and Korean scripts (with over 16,000 characters in the Chinese, Japanese, and Korean set).^[20,21] The RLG staff did ground breaking work on the Chinese, Japanese, and Korean set—work that predated Unicode by over 10 years, and in turn contributed to the eventual development and refinement of the present day global Unicode set.^[22] Extending script capabilities in MARC was followed by the development of non-Latin capability in OCLC and several vendor systems.

INTRODUCTION OF THE INTERNET AND WEB

Since 1990 the technology has made enormous advances that both open new uses for the MARC record data and are pushing MARC into new directions. By 1990, the personal computer (rather than a “dumb” terminal) was well established, as was the development of the infrastructure for the Internet for the United States, supported by the National Science Foundation. Libraries had been using proprietary networks to build and exchange MARC records for two decades but now there was a much easier environment for sharing. Computer specialists rapidly explored the new possibilities by developing protocols that produced Web technology, which took aggressive advantage of the Internet. There were two immediate challenges at first for MARC, one was establishing new exchange patterns that enabled and enhanced the flow of records between systems. The other was the adaptation of the record to accommodate the new forms of materials such as electronic publications and Web sites.

New Interchange Options

One new interchange pattern was the widespread implementation of a search and retrieval protocol, called ISO 23950: “Information Retrieval (Z39.50): Application Service Definition and Protocol Specification.”^[23] This is a machine-to-machine protocol developed by the library community and originally standardized in the United States as ANSI/NISO Z39.50,^[24] then later becoming an ISO standard. It enabled local systems to retrieve records in the MARC communications format from remote sites in response to normal local system searches—records that could be formatted for the local system’s end-user displays or immediately used in a variety of ways including incorporation into a MARC-based online catalog. This was a significant improvement over day or longer delays for a download of a MARC record from a bibliographic network. While Z39.50 is still used extensively around the world because of its widespread implementation, the new technologies since 2000 have spawned a simpler, more streamlined version of that protocol, called SRU, *Search/Retrieve via URL*.^[25] The SRU has many of the same characteristics of Z39.50 but uses an XML syntax structure.

The new interchange options also meant that in the 1990s, batch distribution of MARC records via physical media such as tape almost completely disappeared. The replacement was the batch electronic transfer protocol FTP (File Transfer Protocol). This simple protocol continues to be heavily used in 2008 for transfer of MARC records. Another simple download protocol with slightly more flexibility became an option in the early 2000s, the Open Archive Initiative’s Protocol for Metadata Harvesting (OAI-PMH).^[26] This protocol again enables

easy exchange of full communications format records, and is used with MARC in its XML forms described below.

Electronic Resources

For the second challenge in the Internet era, the adaptation of the MARC record to accommodate the description of new forms of material such as electronic publications and Web sites, the format has had to address several major issues, the most prominent being the need to provide Internet linking to actual resources from the bibliographic record that described the resource. In 1993, even before the now-common Uniform Resource Locator (URL) addressing scheme was completely defined, a field in the MARC format was detailed to contain pathway components for accessing digital resources from a MARC record. That field eventually became the container for the resource's URL. For several years this linking field was adjusted at least annually as the Internet and Web environment matured and became more standards-based. Partly due to the distrust for the persistence of the URL, the community was cautious about adding the URL subfields to other fields. It was clearly important, however, to begin to link out for information that would expand on or supplement that in the MARC record. Thus a subfield for a URL was added to Bibliographic format fields such as the ones for contents notes, summary notes, citations to Archival Finding Aids, citations to additional forms of items, and bibliographical or historical data notes, among others, and the URL linking subfield continues to be added to other relevant fields as uses are identified. The modern MARC-based catalog is thus able to retrieve material comprehensively, integrating access to descriptions for both physical and electronic resources. For electronic material, it can bring to the end user the resources themselves and related resources from a variety of locations.

Other changes to the MARC format as more electronic material required bibliographic description have been addition and adjustment of coded data for the various electronic formats to assist retrieval, additional data for preservation aspects of digital and digitized material, and the addition of copyright status information to assist with issues when digitizing analog material. Partly to accommodate Web resources, the concept of the serial was redefined resulting in the addition of “integrating” resources as a basic form in the MARC record and date types for creation and modification.

Unicode

In the 1990s, the question of using Unicode (which became the ISO standard ISO 10646, *Universal Multi-Octet Coded Character Set (UCS)*^[27]) rather than the original MARC character sets (Latin characters and seven other scripts as described above and commonly referred to as “MARC-8”). The MARC-8 contained over 16,000 characters but the

Unicode set that emerged from the computer industry in the 1990s had a global goal to accommodate all scripts and today contains over 100,000 characters. The MARC community therefore elected to cease development of additional scripts for the MARC-8 set and start working toward the implementation of Unicode with MARC. The first step was to map all of the MARC-8 characters to Unicode so that institutions would eventually be able to convert their data. Then rules and conventions for using Unicode in a MARC exchange record were established, such as the use of Unicode's UTF-8 encoding, definition of character counts, and the marking of a record as Unicode encoded. Unicode specifies three encoding forms of which UTF-8 (UCS Transformation Format 8) is one. Unicode characters in UTF-8 can be represented in a single octet or a sequence of two, three, or four octets, depending on the character's code point. The UTF-8 encoding for Unicode was selected for use with MARC 21 records because the characters in the ASCII repertoire part have UTF-8 encoding identical to ASCII encoding. The UTF-8 is also used in many other applications outside the library community for the same compatibility with ASCII. Finally the community turned its attention to enabling use of all Unicode characters yet still preserving interchange with those using only MARC-8. Thus in 2007 two techniques for conversion of full Unicode records to MARC-8 records were established, one that drops unknown Unicode characters when moving data from Unicode to MARC-8, and another that preserves a reference to the characters that do not exist in MARC-8 so that reconversion or suitable substitutions can be made. The development of these techniques was assisted by modern Internet communications that allowed MARC users from around the globe to participate in the discussion. By 2008, systems were implementing Unicode rapidly and cataloging agencies were beginning to look past the scripts supported by MARC-8 to additional scripts such as those found in Southeast Asia and the Indian subcontinent.

INTERNATIONALIZATION

While ISO 2709 provided a fundamental standard for the structure of the MARC format, its flexibility with respect to tagging allowed its use with differently defined sets of data tags as needed according to other data models. For example, ISO 2709 only specifies tags as three character numeric, but does not designate the semantics of any tag number. Therefore a number of similar but different national MARC formats were designed and implemented around the world in the 1970s and 1980s, primarily on a national basis, such as CAN/MARC in Canada, UKMARC from the British National Bibliography, IberMARC from Spain, SWEMARC from Sweden, and FINMARC from Finland, to name a few. Some of these formats were very similar to MARC 21 but adapted data

fields to suit their national cataloging norms. All of these formats used ISO 2709 for their structure, choosing the same options within the standard that MARC 21 had used, but they often defined different tags for the data fields and different parsing of the data into subfields.

Some of the questions and issues that either united or divided developers of the emerging MARC formats and created this diversity were the following. Fields chosen and subfields defined might vary depending on the purpose of the tagging—for indexing, for special processing, for display or print, for sorting, even for ISBD punctuation. The *library* functions of the record also influenced content designation; functions such as acquisitions and circulation had special needs. The cataloging rules used by an institution could require different heading structures, for example, or special notes, and the subject heading and classification systems used could have specific parsing requirements. Different organizations used different data models for bibliographic data, preferring, for example, to chain together parts of a total description, creating linked dependent records, rather than putting the parts together in one record, creating independent records as with MARC 21. Attempts were made during this period to bring the different MARC formats together with umbrella formats like the IFLA UNIMARC Format^[28] and the UNESCO Common Communications Format^[29] that could be used as bridges for international exchange but that model was more suitable to batch environments which began to disappear rapidly in the 1990s with the Internet advances in communications.

Convergence

Several factors encouraged the harmonization of these various national formats.^[30] One was the movement to vendor rather than locally developed systems that came about in the 1980s and 1990s. As vendors began to saturate the home markets they started looking for external markets, becoming international companies. The different formats in each country hampered this internationalization, and vendors often responded by limiting format offerings, with MARC 21 being the most prevalent format supported, or charging institutions extra for retooling a system for a different format. This extensive use of MARC 21 occurred partially because a number of the system vendors originated in the United States that used MARC 21 as the national format, or, if the vendor came from another country, it wanted to introduce its system into a MARC 21 market, such as the United States market. The large numbers of libraries, strong standards orientation, common language, and the availability of Library of Congress cataloging in MARC 21 since 1969 made the United States an especially fertile vendor market and country for vendor development. The large networks such as OCLC were another major influence on MARC standardization. In the 1990s, there were several of these large

networks in the United States, all MARC 21-based, and they provided services to other countries. With the consolidation of several of these into OCLC, the impetus to use MARC 21 was strengthened.

In the 1990s, the decision by South Africa and Canada to move from national formats to using MARC 21, if appropriate harmonization changes could take place, was an important event. In the case of South Africa, which had used a UNIMARC-like format for almost two decades, a careful cost-benefit study recommended a shift to MARC 21 in order to be able to take advantage of MARC 21-based records and systems and to be able to join international cooperative cataloging programs. For Canada, the Canadian and the United States formats were so similar that it was hard to justify their differences. That harmonization led to the establishment of the name MARC 21 for what was before USMARC and CAN/MARC.

A number of countries have adopted MARC 21 or changed to it from national formats over the last decades; for example, Poland, Switzerland, and Brazil adopted MARC 21, and Australia changed to it from AUSMARC and Sweden from SWEMARC. Since 2000, harmonization processes have taken place between MARC 21 and the British UKMARC and German MAB formats bringing a significant body of users to a common format. International interest in MARC 21 has led to the development of a number of translations of the format, especially of the concise version. The Bibliographic format has been translated into a diverse number of languages, including Arabic, Catalan, Czech, Finnish, French, German, Hungarian, Italian, Korean, Norwegian, Persian, Portuguese, Russian, Serbian, Spanish, and Swedish.

Maintenance

Maintenance of the MARC 21 format was traditionally centered at the Library of Congress, as the agency that led its development. This is still the case but the format changes are in response to the input from the whole community of users. Today any user may submit a proposal for change that is then processed and posted on the MARC 21 Web site^[31] for review, and various groups hold discussions and forward their recommendations. The primary review body has become one established under the auspices of the American Library Association, Machine-Readable Bibliographic Information (MARBI), whose meetings also include representatives from multiple user constituencies, such as several national libraries that use MARC 21, the other United States national libraries, representatives from special material associations and committees, such as music and maps, and representatives from record and system vendor communities. The discussion and votes at these twice-yearly MARC advisory committee meetings and from the Internet provide guidance for the Library of Congress, Library and Archives Canada, and the British Library to make final decisions on changes.

OTHER RECENT DEVELOPMENTS

The MARC 21 format is still being adopted in various countries and by institutions around the world. However, explorations are taking place to leverage the data elements of MARC and the millions of MARC records in the bibliographic universe to new platforms. Current efforts revolve around syntax flexibility, data modeling, and element retagging.^[32]

Syntax

An additional development in the 1990s has been the attempt to separate the MARC data elements from the MARC structure (ISO 2709) to enable representations of the highly developed MARC data elements in other syntaxes. The development of the Internet and the Web technology in the early 1990's rapidly increased the real-time interaction of people, institutions, and applications in the computer environment. Computer specialists thus became much more interested in universal data markup standards that have the possibility to be read, understood, and displayed by any computer system. Initially this took the form of markup for display, epitomized by HTML (Hyper-Text Markup Language), which is an implementation of a more generalized structure standard, Standard Generalized Markup Language (SGML).^[33] The SGML is a structure with rules for tagging data, roughly comparable to ISO 2709. The SGML, while somewhat complex, seemed to have traction in the computer community by the mid-1990s. The Library of Congress thus convened a small group of MARC experts and SGML experts to investigate using the SGML markup structure as an alternative to ISO 2709 with the MARC data elements. At that time several attempts had already been made to define MARC in SGML so those experiences were a component of the discussion.

The ISO 2709 structure of the MARC record was innovative and forward looking—and carefully adapted to the characteristics of bibliographic data—but it was not adopted outside the library community and is not a

suitable markup for full text of documents, such as books. ISO 2709 was optimized for records composed of many shorter variable length data elements to which random access is desirable, whereas SGML initially targeted full text markup, focusing on sequential access to data.

Following guidelines specified by this experts group, the Library of Congress had two MARC in SGML formats written, one that combined the elements from the MARC Bibliographic, Holdings and Community Information formats and another the elements from the Authorities and Classification MARC formats. These SGML formats, called Document Type Definitions (DTD) in the SGML environment, took the approach of including context in the name of each element, which resulted in both long names and a large number of elements—thus very large DTDs. While the DTDs had some significant advantages over the ISO 2709 formats, such as the validation attributes that could be built into the DTD enabling machine-driven “self-validation” of records, by the time experimentation began to take place the computing environment had developed a simpler derivative of SGML, called eXtensible Markup Language (XML).^[34] The original MARC SGML DTDs were converted into XML DTDs later. Besides being simpler, XML could also be specified as an “XML schema” in addition to a DTD. While XML schemas do not have the validation attributes of the DTD, they are themselves written in XML which has other processing advantages. XML has achieved broad adoption by the Web and the computing environments, which means many generalized tools that manipulate XML data are available.

Based on the experience with MARC in SGML and several other models for MARC in XML that took a streamlined approach producing a very brief XML schema, the Library of Congress prepared an XML schema for MARC in 2003 that the community has found very useful and timely.^[35] This schema, called MARCXML, enables MARC data to be easily translated into an XML structure for manipulation or for exchange using interchange protocols that either require or prefer to carry XML structured data (Fig. 2). For example, the SRU search protocol prefers XML and the OAI-PMH record distribution protocol requires it.

</datafield>
```

Fig. 2 Bold segment of the MARC 21 record in Fig. 1 with MARCXML syntax (author, title, edition, and publisher part only).

A pathway into XML appears not to be single threaded, but the library community will be able to use the new structures for MARC where applicable along with the classic structure until there is a clear way forward. The prior convergence of MARC formats to MARC 21 in the classic structure will be highly useful as MARC evolves into new structures.

While these structures are still under development and adoption, another technique for markup, called RDF (Resource Description Framework) is also being explored. The RDF makes it possible to mix XML data elements from different schemas in one “package,” a flexibility that could prove useful to libraries as they interact with the broader cultural community.

Modeling

There has been a strong focus on more rigorous information modeling over the last decade. A conceptual model for bibliographic data was completed by the International Federation of Library Associations and Institutions in 1997 and published as the *Functional Requirements for Bibliographic Records* (FRBR).^[36] At a simplified level, FRBR defines a four tier hierarchy for elements of document description—*work* (the most general), *expression*, *manifestation*, and *item*—and identifies the entities and relationships that are appropriate for each. Over the decades, the bibliographic universe has devised various methods to bring together for the library patron different editions, performances, versions in different media, etc., anticipating that the patron is often seeking a work, not necessarily a particular version or manifestation of a work. The FRBR analysis thus supports new approaches for presenting bibliographic search results to users that bring materials of potential interest together, making them easier for the user to peruse. The Library of Congress commissioned a mapping of all the MARC 21 data elements onto the FRBR model, *Functional Analysis of the MARC 21 Bibliographic and Holdings Formats*^[37] in order to enable experimentation. This was followed by explorations by various organizations of presenting bibliographic search results in a FRBR form from MARC records.^[38]

While the MARC 21 record can accommodate data brought together following a number of models, the record content model that is used almost universally is the unit record that in FRBR terms describes a manifestation. In a unit record, a bibliographic resource is fully described in one record and, while there may be references and linkages to other resources or entities described in other records, a fully understandable presentation can be made from the unit record since the names and titles of related entities are also contained in it. Many internal files hold the MARC-based record data in unit form but others take a more relational approach internally. The focus on the unit record by MARC 21 users also relates to the multiple uses of the bibliographic record. Union databases attach holdings to specific manifestations of a work, and catalogers need to be able to carry out copy cataloging for specific manifestations. Given the advantages to the end user of some aspects of the FRBR model and the expectation that it may be fundamental to newer cataloging rules, investigations will continue to assure that systems are able to use and share FRBR-based entity-relationship analysis.

Related Developments

MARCXML brings some advantages of the XML environment to MARC 21 but leaves the MARC data elements somewhat bound by the same constraints that MARC data now have in the MARC 2709 environment after many years of constant adjustment and augmentation. The MARCXML simply changes the structure, not the fields, indicators, subfields, and coded values of MARC 21. Therefore a next logical step is to remodel and retag the MARC data and explorations have taken place in that area also. In 2003, the Library of Congress introduced for public review the Metadata Object Description Schema (MODS),^[39] an XML schema that is much simpler than MARC and repackages some of the MARC data that had become scattered in MARC 21 because of its development over time.^[40] MODS has a strong affinity to MARC 21, however, so that for most records little is lost in the transformation from MARCXML to MODS (Fig. 3). The MODS is more oriented toward XML data models so it is especially useful for the descriptive metadata component of “wrapper” formats that bundle together the descriptive

metadata, technical and administrative metadata, and the actual digital resources themselves, such as the Metadata Encoding and Transmission Standard (METS).^[41]

SUMMING UP

MARC has achieved worldwide use as a format for the exchange of bibliographic data, and thus served as a facilitator of global library cooperation. It was a key component in the library environment to standardize in order to stimulate, rather than stifle, innovations in the systems for end users and record sharing networks. Today its innovative structure, while still serving in most venues, is beginning to transform into new data structures that take better advantage of the newer Web technologies. Already MARC is available in XML forms and additional syntaxes will be offered for MARC data. However, the enormous body of MARC 21 records and MARC-21-based systems will assure that format interchangeability will remain an important component of new environments.

Makerspaces in Libraries

Patrick Tod Colegrove

DeLaMare Science & Engineering Library, University Libraries, University of Nevada, Reno, Reno, Nevada, U.S.A.

Abstract

From the advent of hackerspaces and Fab Labs to the rise of the maker movement, makerspaces, and their integration with library practice, an underlying societal shift toward embracing the active do-it-yourself culture of “making” seems fundamental to the increase of makerspaces in libraries. This entry explores the concepts of makerspaces generally, building from a historical background to examine theoretical and practical underpinnings of the movement. A timeline is presented tracing early implementations of makerspaces in both public and academic libraries, and rationales for their integration into library practice examined. A seemingly natural combination, makerspace in libraries offers a framework by which shared core library and community values such as equitable access to information, resources, and opportunity for lifelong learning can be reconciled and amplified. Alignment with a number of broader national educational initiatives is enhanced, including efforts focused on closing learning gaps in science, technology, engineering, math, and the arts; support for the active production of knowledge and information products is increased, yielding deep learning and engagement on the part of library users. Adoption and implementation of makerspaces in libraries is widespread and growing, enabling libraries worldwide to realize evermore central roles in their communities.

INTRODUCTION

As libraries around the world evolve to meet changing needs of the communities they serve, the adoption of makerspaces in libraries is increasingly seen as core to library practice. Broad overlap exists between the missions and core values of libraries and makerspaces. Both intrinsically enable and provide equitable access to a diverse set of resources in the service of education, learning, and by extension the greater public good. Libraries and makerspaces are fundamentally about knowledge creation, achieved through a combination of self-directed and peer-to-peer engagement and collaboration around shared resources in an open environment. Consider the long-held mission and core practice of libraries articulated in a way that just as easily describes makerspaces:

[t]he mission of a library is to improve society through facilitating knowledge creation in the community. . . . Good libraries build services (and the collection is one of many). Great libraries build communities.^[1]

The following sections explore what is meant by “makerspace” and the root word “maker,” examining whether makerspaces in libraries is a natural next step in the practice of librarianship or a radical new departure. Building from a brief historical and theoretical background of the undercurrents driving the adoption and integration of makerspaces in libraries today, the practice is framed against enduring values of librarianship and established with appropriate theoretical underpinnings.

Rationales for the potential incorporation of makerspaces in libraries are considered, including the potential for increased alignment and support for K-12 and lifelong learning objectives, innovation and entrepreneurship, and career development. Finally, a number of resources are provided to enable exploration and use in further development of the practice of makerspaces in libraries.

MAKERS, THE MAKER MOVEMENT, AND THE RISE OF MAKERSPACE

In the premiere issue of *Make* magazine, February 2005, founder Dale Dougherty coined the term “maker” as a deliberately generalized way to describe the new publication’s customers. Rather than “users” or “patrons,” the term “maker” would soon become associated with a sense of curiosity and intellectual adventure. The publication served as a touchstone for the rapidly growing maker subculture: a community of individuals with an interest in *making* things as opposed to merely *consuming*. An extension of do-it-yourself (DIY) culture, in the subsequent year over 22,000 makers converged on the San Francisco Bay Area for the first ever “Maker Faire”—clearly, the public’s interest was caught. The following year saw the number of attendees triple over two separate events, and by 2014 Maker Faires attracted a total of 781,000 attendees to 135 designated events worldwide in celebration of making.^[2]

The grassroots movement catalyzed around the words “make,” “maker,” and “making,” began to be referred to

as the “maker movement.” An “umbrella term for independent inventors, designers and tinkerers,”^[3] the phrase refers “broadly to the growing number of people who are engaged in the creative production of artifacts in their daily lives and who find physical and digital forums to share their processes and products with others.”^[4] The words “maker” and “making” derive from the underlying verb “make” and are themselves literal terms; Roslund and Rodgers explain

Makers are people who do things to improve the world around them. If something is broken, they try to fix it. They try to find solutions to problems. Someone who likes to build new things or use tools or materials in new ways can be considered a maker. Anyone who has ever had an idea for a new invention and then made that idea a reality is a maker. Makers love to create, tinker, and play with the world and the resources around them. They also love to share their experiences with others.^[5]

Makers are fundamentally experiential learners, actively engaged and solving problems, posing questions, and making decisions. In combination with more traditional library resources, such as supporting print and digital resources, the value of makerspaces in libraries becomes clear; whether K-12, higher education, or life-long, makerspaces directly enable learning. Halverson and Sheridan^[4] point out that “educators and researchers have been talking for decades about the role of making in learning,” suggesting that Papert’s learning theory of constructionism, which places production-based experiences at the core of how people learn, fundamentally undergirds learning and the maker movement generally. Blikstein^[6] agrees, adding experiential education and critical pedagogy to comprise three theoretical pillars on which the foundation of digital fabrication and “making” in education is based; going further to point out that “the ideas behind this movement are at least a century old,” tracing the root of the idea that education should be more connected to real world objects and experiences back to John Dewey and others.

Making is an overarching term that encompasses a wide range of activity. Prior to the popular use of the terms making and makerspace, broad categories of maker activity grew under the names of “hacking” and “fabbing.” The emergence of community “hackerspaces” and “Fab Labs” (Fabrication Laboratory), each a specialized type of makerspace, served growing communities, with one of the first independent hackerspaces, the German *c-base*, opening its doors in 1995.^[7] Although the terms hackerspace and Fab Lab are often treated as being synonymous, each refers to distinctly differing constructs despite appeal to often overlapping interests and communities of practice. Each is a type of makerspace, with hackerspaces defined in broad strokes as “community operated physical places where members can meet and work on projects.”^[8] In practice, membership and activities

at hackerspaces tend to be largely focused on repurposing hardware, working on electronics, and programming rather than broad-based fabrication.

The concept of the Fab Lab grew out of a popular class at the Massachusetts Institute of Technology (MIT) named “How To Make (Almost) Anything.”^[9] In 2001, the Fab Lab program, and eventual international network, began as an educational outreach program funded by the National Science Foundation for the newly established Center for Bits and Atoms at the MIT Media Lab.^[10] Rather than repurposing or programming with existing components, a Fab Lab is a space designed specifically around enabling individuals to personally manufacture physical items from source materials. Focused on enabling its users to bring their ideas to life by means of personal digital fabrication, resources are comprised of “off-the-shelf, industrial-grade fabrication and electronics [sic] tools, wrapped in open source software and programs.”^[11] Typical equipment in a Fab Lab might include laser cutters, computer numerical controlled milling machines and lathes, 3D printers, and other rapid prototyping equipment. With the ability to make almost anything, the perspective of a Fab Lab user quickly changes as recognition begins to dawn: literally *each and everything in the manufactured world around us has in some way been made*. Curiosity piqued, wonder as to exactly how starts to become unavoidable; household items become objects of close scrutiny, reverse engineering, redevelopment, and reuse. Recognizing the potential of the deep project-based learning and engagement enabled by access to such an environment, in 2008 Stanford University started building Fab Labs in cooperation with K-12 schools worldwide as part of the FabLab@School project.^[6]

With hackerspaces numbering today over 1200 worldwide,^[12] and Fab Labs in the hundreds,^[13] in 2011 Dale Dougherty and Dr. Saul Griffith^[14] proposed the audacious *MENTOR Makerspace* program to the Defense Advanced Research Projects Agency of the US federal government. With a goal of “reaching 1000 high schools over 4 years,” the program was part of an initiative “aimed at introducing new design tools and collaborative practices of making to high school students.” Intended to not only to bring a more diverse group of young people into careers such as scientist, engineer, or programmer, the goal of the proposed program was to address a recognition that “one of the biggest challenges we face as a nation is the decline in our ability to make things.”^[15] Awarded in 2012, the term “makerspace” quickly became mainstream as “countless museums, schools, community centers, and libraries announced plans to build digital fabrication and ‘making’ facilities.”^[6] Across the United States and Europe, technology-oriented makers began to come together to pursue interests including electronics, robotics, and 3D printing, supported by these makerspaces.

As the practice grew, the term “makerspace,” a deliberate blend of the word “maker” with “space,” quickly became accepted as the broad overarching term—a general

term, inclusive of the earlier, more specialized spaces such as Fab Labs and hackerspaces:

A makerspace is a physical location where people gather to share resources and knowledge, work on projects, network, and build. Makerspaces provide tools and space in a community environment—a library, community center, private organization, or campus. Expert advisors may be available some of the time, but often novices get help from other users (emphasis added).^[16]

MAKERSPACES IN LIBRARIES: A TIMELINE

In 2011, Lauren Smedley and colleagues, under the direction of Sue Considine, Executive Director at the Fayetteville Free Library (FFL) in New York State, were forging a new path for libraries and the maker movement. Recognizing the dual opportunity of outreach and support for lifelong learning and engagement, the FFL's "Fabulous Laboratory" was launched, making the FFL "Fab Lab" the first makerspace created by a public library.^[17] Other public libraries quickly followed suit; first movers and notable early adopters included

- Steve Teeri, in partnership with the local Mt Elliot Makerspace, launched the Detroit Public Library's HYPE (Helping Young People Excel) Makerspace in April 2012. With the goal of supporting the community by creating "interesting, inventive, and productive citizens who make a difference,"^[18] the space set out to inspire young adults "through the spirit of invention, creativity, learning, and do-it-yourself (DIY) culture."^[19]
- Bill Derry and director Maxine Bleiweis boldly carved out space in the midst of open bookstacks to create the Westport Public Library Makerspace, opening "a place for creation, collaboration, innovation and entrepreneurship"^[20] on July 2, 2012.
- Andrea Saenz, First Deputy Commissioner for the Chicago Public Library, was instrumental building on a successful 2009 launch of its YouMedia teen digital learning space,^[21] itself an early form of makerspace in libraries. Based largely on the HOMAGO framework of Muzuki Ito et al., and focused "on art, digital media, making and STEM (science, technology, engineering and math) projects," Chicago's first free and publicly accessible makerspace opened the doors of its Maker Lab July 2013.^[22]

At the same time, similar development was ongoing in academic libraries across the United States:

- Lisa Kurt, Emerging Technologies Librarian, and director Tod Colegrove, of the DeLaMare Science & Engineering Library at the University of Nevada, Reno, made news in July 2012 with the launch of 3D

printing and scanning as a service of the academic library.^[23] Notably, the library went on to be named one of the "Most Interesting Makerspaces in America" in 2014 by *Make* magazine.^[24]

- Also in 2012, the library at the University of Mary Washington, in collaboration with their College of Education and Division of Teaching and Learning Technologies,^[25] converted an unused classroom into its ThinkLab makerspace: "if you can DREAM it you can MAKE it."^[26]
- Adam Rogers, Emerging Technologies Librarian, planned and launched^[27] the Hunt Library Makerspace January 2013 on the fourth floor of the James B Hunt Library at North Carolina State University: supporting "students, faculty, and staff in learning about emerging technologies and bringing their creations to life."^[28]

A survey of libraries conducted near the end of 2013 indicated that makerspaces had already gained significant and increasing traction in libraries around the world. In response to the question, "Does your library provide a makerspace or similar space?" of 143 respondents across 30 states in the United States and librarians from seven other countries, 42% (58) of the respondents answered yes, with another 36% (51) answering they were planning to do so in the near future. Fully 78% of the respondents indicated they either already provided makerspace or were planning to do in the near future. The majority of individuals participating in the survey, 51% (73), indicated they were from public libraries, academic libraries as the next largest group at 36% (51). Overall, nearly half indicated their makerspace was less than a year old, with 11% (16) indicating that their space had existed for more than 2 years.^[29]

RATIONALE: CORE LIBRARY VALUES, STRATEGIC ALIGNMENT

The membership of a library, much like that of a makerspace, are typically users of a wide range of highly individualized information resources. In addition to directly enabling self-directed learning and innovation, makerspaces in libraries are proving to be hotbeds of collaboration, co-learning, and acquisition of twenty-first-century literacies. Librarians and libraries adopting and integrating makerspaces into practice worldwide need look no further than the Core Values of Librarianship as articulated by the American Library Association to be able to recognize and articulate an underlying rationale for their incorporation and use. Of the 11 values identified, over half appear to resonate in support of makerspaces (emphasis added):^[30]

- *Access:* equitable access to information resources regardless of technology

- *Democracy*: an informed citizenry through free and equal access to information [and by extension, information resources and appropriate technology needed for that access]
- *Diversity*: providing a full spectrum of resources and services
- *Education and lifelong learning*: promoting the creation, maintenance, and enhancement of a learning society
- *Intellectual freedom*: upholding and resisting efforts to censor library resources
- *The public good*: libraries, and the access we provide is a fundamental institution that should not be outsourced or privatized
- *Service*: professional development of co-workers as well as community members, maintaining and enhancing our own knowledge and skills
- *Social responsibility*: contributing to solving the critical problems of society, support for efforts to help inform and educate the people

As libraries continue to explore the possibilities and impact of incorporating makerspace in service of their core mission, the potential significance is becoming clear. Makerspace is first and foremost about active and participatory learning, whether self-directed or guided; its incorporation yields potentially immediate improvement in alignment with overarching learning, discovery, and engagement missions of libraries. That potential has been repeatedly identified by the New Media Consortium (NMC) in its annual environmental scan. The *NMC Horizon Report 2015 Library Edition* goes further, stating

The turn of the 21st century has signaled a *shift in the types of skillsets that have real, applicable value in a rapidly advancing world*. Creativity, design, and engineering, or in a word — invention — has become the hallmark of innovation on campuses across the globe... During a time when academic libraries are undergoing significant transformation, *the addition of makerspaces is solidifying the library's position as a hub where students and faculty can access, create, or engage in hands-on projects across departmental lines* (emphasis added).^[31]

The overall goals and concept of makerspace as described in the *Makerspace Playbook* further amplify the potential:

By helping schools and communities everywhere establish Makerspaces, we expect to *build your Makerspace users' literacy in design, science, technology, engineering, art, and math...* We see making as *a gateway to deeper engagement in science and engineering but also art and design*. Makerspaces share some aspects of the shop class, home economics class, the art studio and science lab. In effect, a Makerspace is a physical mashup of these different places that allows projects to integrate these different kinds of skills (emphasis added).^[32]

Table 1 Top 10 technology/activities most commonly reported in library makerspaces worldwide.

Technology or activity	% of All respondents
Computer workstations	67%
3D printing	46%
Photo editing	45%
Video editing	43%
Computer programming/software	39%
Arts and crafts	37%
Scanning photos to digital	36%
Creating a Website or Online Portfolio	34%
Digital music recording	33%
3D Modeling	31%

Source: From Burke.^[29]

Whether “building users’ literacies across multiple domains” or serving as “gateway to deeper engagement,” the outcomes speak to core library values. With resources and opportunities like those found in a makerspace, the environment is rich with possibility to build user literacies across a wide range of new media. A subset of the findings of a global survey, Table 1 details the top 10 most commonly reported technologies or activities in library makerspaces.^[29] Consider the diversity: from computer workstations, photo and video editing, 3D modeling and printing to arts and crafts or music recording. Where else could an individual reasonably expect to access such a breadth of access to technology—complete with opportunity and encouragement to acquire and practice such potentially emergent literacies?

Library support for educational and learning objectives may derive further benefit from an apparently remarkable alignment between makerspaces and a number of broader national educational initiatives. In 2015, a survey conducted by the Maker Education Initiative^[33] found at least half of makerspaces surveyed reporting alignment with the following:

- Science, Technology, Engineering, and Mathematics, STEM (as illustrated at ed.gov/stem), 94% of sites indicated alignment
- STEM + Art = STEAM (stemtosteam.org), 89%
- Technology education (ed.gov/connected), 79%
- Media education, 57% (no url provided to illustrate the initiative)
- Twenty-first-century Community Learning Centers (www2.ed.gov/programs/21stcclc), 51%

Given the breadth of access to resources, and alignment with national K-12 and lifelong learning initiatives, it is becoming plain that makerspaces in libraries can provide an environment rich with opportunity. Beyond cultivating interest and engagement across STEAM disciplines among individuals in the K-12 pipeline, the makerspace environment can at the same time enable parents and communities to actively develop life and career skills.

Information, media, and technology skills develop as a direct result of user engagement with makerspaces in libraries. Innovation and entrepreneurship are also proving to be natural outcomes; similarly, creativity, critical thinking, problem solving, communication, and collaboration seem to fall out naturally—top skills and values sought after by employers today. Clearly, the incorporation of makerspaces with libraries offers potential benefit in the strategic alignment of the library with goals and objectives of both the parent organization and the greater community. Further, alignment and affiliation with broader educational initiatives, perhaps in cooperation with community makerspaces external to the library, can benefit the entire community. Arguably, the traditional role of the library has been to encourage and enable the creation of knowledge; rather than conflicting, makerspace in libraries is in direct alignment with traditional roles.

Makerspaces and libraries are clearly distinct entities; their similarities are nevertheless striking.^[34] To begin with, makerspaces and libraries are fundamentally constructivist learning spaces; places where members of the community have equitable access to materials and resources that might not otherwise be available to them—indeed, that they may have never even considered to be within reach. A by-product of shared community access, libraries, and makerspaces both serve to reinforce and build community among their membership. One-on-one guidance and mentoring is more the norm than the exception in both libraries and makerspaces; when combined with their fundamentally interdisciplinary nature, an environment alive with creativity and knowledge creation results. Individuals from across a wide range of interests, social backgrounds, and expertise, share access to a limited set of resources in both makerspaces and libraries, including each other. The resulting creative abrasion and collaboration, with appropriate support and encouragement, virtually ensures an environment of continuous and ongoing innovation. Together, makerspaces in libraries can truly be more than the sum of their parts.

CONCLUSION

Throughout history, libraries have adapted and evolved to better meet the needs of their communities, adopting and incorporating technologies along the way. The turn of the twenty-first century finds many libraries embracing an underlying societal shift toward making as opposed to merely consuming, moving away from a largely exclusive focus on the collection of knowledge artifacts that have ranged from papyrus scrolls through the print codex to e-books and other digital resources. As the practice of librarianship continues to evolve, increasing support for the active creation of knowledge and knowledge artifacts—in a word, *making*—by members and communities of the library is becoming standard practice. Examples

might include print or electronic documents and databases being actively created and/or accessed by means of computer workstations, software, and printers; photo, video, and 3D scans or models similarly being created, edited, and remixed across a variety of media; or computer programming taking place next to arts and crafts projects. As information becomes increasingly fluid, across not only media but technologies, enabling knowledge creation among individuals and communities of practice becomes an ever more valued and central role of the library.

Implementation of makerspaces in libraries is widespread and increasing, with libraries worldwide realizing an ever more central role in the communities they serve. With the growing number of individuals identifying with DIY “maker” culture finding community in makerspaces around the world, libraries have recognized an opportunity to reconcile the shifts with core library values. Makerspaces in libraries were born and are flourishing, resonating with corresponding values of the organization and greater community. With knowledge creation a by-product of both the consumption and production of information and tangible products, the advent and integration of makerspaces into libraries promises a depth of opportunity—enabling deeply personal learning and engagement even as it transforms the library’s support for innovation and entrepreneurship. As libraries continue to explore and develop the practice, makerspaces in libraries is yielding benefits that go beyond strategic alignment: improved support for K-12 and lifelong learning initiatives, transformative opportunity to develop information, media, and technology skills, and enhanced community are all natural outcomes.

ACKNOWLEDGMENTS

The author is deeply grateful for the many and ongoing contributions of colleagues across libraries, museums, and learning facilities actively exploring the possibilities of makerspace and contributing to the conversation. In particular, the Institute of Museum and Library Services is explicitly acknowledged for the critical path role they have taken to convene the conversations and catalyze continued collective development.

Management of Very Large Distributed Shared Collections [ELIS Classic]

Reagan W. Moore

*San Diego Supercomputer Center, University of North Carolina at Chapel Hill, Chapel Hill,
North Carolina, U.S.A.*

Abstract

Large scientific collections may be managed as data grids for sharing data, digital libraries for publishing data, persistent archives for preserving data, or as real-time data repositories for sensor data. Despite the multiple types of data management objectives, it is possible to build each system from generic software infrastructure. This entry examines the requirements driving the management of large data collections, the concepts on which current data management systems are based, and the current research initiatives for managing distributed data collections.

INTRODUCTION

Scientific data collections are being assembled that contain the digital holdings on which future research is based. The collections are assembled by researchers from multiple institutions, and then accessed by all members of a scientific discipline. The data collections are massive in size, comprising hundreds of terabytes of data (a terabyte is a thousand gigabytes) and tens of millions of files. The software infrastructure that manages these collections must provide not only traditional digital library services, such as indexing, discovery, and presentation, but also preservation services to ensure authenticity and integrity. The types of material in the collections range from digital simulation output generated by scientific applications, to observational data taken by experiments, to real-time sensor data streams from thousands of sensors. Thus the management of scientific data collections requires the integration of capabilities from multiple disparate communities: data grids for sharing data, digital libraries for publishing data, persistent archives for preserving data, and real-time sensor systems for automating the creation of collections.

The challenge is made more difficult by the fact that large data collections are inherently distributed. The collections may reside on multiple storage systems with a copy on disk for interactive access and a backup copy on tape for long-term preservation. Their assembly may involve collaborators from multiple institutions, with both the sources of the collection coming from multiple sites and the users of the collection located at multiple sites. To effectively mitigate risk of data loss, data collections are distributed across multiple types of storage systems located at geographically separated locations. All of these reasons force scientific data collections to build upon software systems that are capable of managing distributed data.

In this entry, we give some examples of large scientific collections, examine the fundamental principles on which distributed shared collections are based, describe data management infrastructure that is in production use today, and close with a description of the next generation of data management software that is currently under development.

SCIENTIFIC DATA COLLECTIONS

Researchers that generate large scientific data collections include seismologists, high-energy physicists, astronomers, and educators. Seismologists manage observational data about the propagation of seismic waves through the earth crust, and generate very large simulation output data sets to predict the effect of earthquakes. An example is the Southern California Earthquake Center (SCEC),^[1] which has stored over 165 TB of simulation output, comprising more than 3.5 million files, with more than 70 researchers collaborating on the creation of the SCEC collection.^[2] The SCEC project is now proposing the generation of more than a petabyte of data (a petabyte is a thousand terabytes) from higher resolution simulations of seismic waves generated by an earthquake on the San Andreas Fault in Southern California.

The BaBar high-energy physics project^[3] replicates experimental data taken at the Stanford Linear Accelerator in Palo Alto, California to researchers in Lyon, France at the Institut National de Physique Nucleaire et de Physique des Particules. The project has replicated more than 700 TB of data, moving up to 5 TBs of data per day between the sites. When the CERN accelerator becomes functional, related high-energy physics projects will generate a petabyte of data per year.^[4]

The largest data sets in the future may come from the astronomy community. The Large Synoptic Survey

Telescope^[5] will take images of the sky every 3 days to detect near-earth objects such as asteroids, starting in 2013. More than 100 PB of images will be archived. Current astronomy sky surveys are measured in the tens of terabytes in size. The 2-Micron All Sky Survey comprises 12 TB of images aggregated across 6 million 2 MB files.^[6]

The National Science Digital Library^[7] organizes scientific educational material that is posted on Web sites. The URL of each item is registered into a central repository at Cornell University. An archive, comprising over 70 million Web pages, has been assembled by crawling the Web sites. The archived Web pages are aggregated into containers and stored on both tape and disk to provide an alternate retrieval location when the original Web site is not available.

The Real-time Observatories, Applications, and Data management Network (ROADNet)^[8] manages real-time sensor data streams from more than 4,000 sensors. Data is streamed from seismic sensors, environmental sensors, coastal lidar systems, remote cameras, and oceanographic sensors into object ring buffers, and then archived for later use. The sensor streams can be queried to identify relevant data, and then correlated with other data streams. The 4,000 sensor data streams come from multiple independent projects, but rely upon common software infrastructure to facilitate use by researchers.

Each of these collections is distributed across multiple storage systems, located at different institutions, with the local infrastructure managed by local administrators. The fundamental underlying principle that is used to manage the data is that of a shared collection. Software infrastructure is installed at each site that makes it possible to name, organize, and access the data as if it were stored on a local resource. The software infrastructure has to provide a uniform name space for identifying the files, manage access controls across multiple independent institutions, manage replication of the files onto multiple types of storage systems, manage checksums to ensure data integrity, manage descriptive information about each file, and provide uniform access mechanisms to data stored on multiple types of storage systems (disk, tape archives, binary large objects in databases, database tables, and object ring buffers for sensor data). The software technology that does this is called a data grid.^[9]

DISTRIBUTED DATA MANAGEMENT PRINCIPLES

The preservation community bases their data management on the principles of authenticity and integrity.^[10] Authenticity is an assertion that the provenance (attributes about the creation of the data) is preserved. This includes the concept of “chain of custody”; that operations on the data have only been performed by authorized archivists. Integrity is an assertion that the preservation environment has

not compromised the data; that the bits have not changed. It is not sufficient to show that the data are uncompromised, one must also show that the data correspond to the original deposition into the collection with an unbroken chain of control, and that the data can be interpreted and manipulated even after the original creating application is gone. The latter implies the need to manage technology evolution. A preservation environment insulates the records from changes occurring in the technology used to support the collection.

The same principles apply when assembling distributed shared collections. The origin of the scientific data must be tracked to assign academic credit, provenance information is needed to guide the use of the data, and the integrity of the data must be maintained. Shared collections use descriptive metadata organized in a central catalog to manage provenance information. However, management of integrity in a distributed environment is much harder. There are multiple risks that must be mitigated: media corruption such as a disk crash or broken tape; operator error such as data overwrites on both disk and tape; systemic vendor error such as bad microcode in a tape drive; natural disaster such as fire or flood; and malicious users. These are compounded by the unavailability of systems due to network outages and remote maintenance periods. Any problem that occurs in the distributed environment is treated as a problem of the data grid, instead of the remote resource.

The additional principle that is needed is the concept of infrastructure independence.^[11] The properties of the shared collection are managed independently of the capabilities of the storage systems where the data reside. The three main categories of properties that must be managed for shared collections are data virtualization, trust virtualization, and management virtualization. Data virtualization manages the naming, access, and manipulation of data independently of the type of storage system. Trust virtualization manages authentication and authorization independently of the remote administrative domains. Management virtualization characterizes and automates the application of management policies independently of the remote institutions. Through these three virtualization mechanisms, one can access distributed data, control who is allowed to use the data, and verify that the authenticity and integrity have been preserved even for data located on another continent on a storage system managed by a separate institution. Because the virtualization mechanisms are automated by software infrastructure, very large collections can be maintained with a minimal amount of labor support. The goal is software that can evaluate assessment criteria, track whether each file in the system has been correctly managed, and initiate recovery procedures while maintaining audit trails of all operations applied to each file. Such an environment can institute management policies that mitigate the risk of data loss through replication and synchronization within a data grid, and federation between independent data grids.

Note that infrastructure independence implies the ability to add new technology over time, and migrate a collection from obsolete technology onto new technology. The ability to manage data distributed across multiple types of storage systems is the same ability that is needed to manage technology evolution for preservation environments.

Data Virtualization

Data grids implement logical name spaces that are used to identify not only the files, but also the users of the system and the components of the system. Typically, three name spaces are controlled by data grids:

1. Distinguished name space for users. The identity of the archivists, or curators, or users is managed independently of the remote storage system or administrative domain. Users of the system authenticate their access based upon the authentication system implemented by the data grid.
2. Logical name space for files or digital entities. The digital entities that are registered into the shared collection may be files, binary large objects, database tables, URLs, SQL command strings, or remote directories. Any organization that is imposed on the distributed data is expressed as a structure on the logical file name space such as a collection hierarchy.
3. Logical name space for storage systems. Multiple physical storage systems may be identified through a single logical storage resource name. This makes it feasible to support collective operations across storage systems, such as automated data replication (writing to a logical resource name causes a copy to be made at each of the associated physical storage systems), load leveling (a copy is made at the storage system with the most space left), or caching (a copy is made on a disk cache associated with a tape archive).

Given these three logical name spaces, access controls can be asserted as constraints between the logical user name space, the logical storage name space, and the logical file name space. When data is migrated onto new resources within a data grid, neither the file name nor the access controls change. The data grid associates provenance information with the logical file name, ensuring that authenticity can be preserved. The data grid associates system-level metadata such as checksums, audit trails, replica location, access controls, file size, and creation time with the logical file name, ensuring that integrity can be tracked over time. Data grids use a central metadata catalog to hold both the provenance and system-level metadata.

Data grids are implemented as peer-to-peer software servers, with a software server installed at each storage system where the data reside. The software server

manages the mapping from the logical file name to the physical file residing on the storage system for access, and the mapping from the access protocol desired by the user to the access protocol used by the storage system. Part of infrastructure independence is the ability to use your preferred access protocol to retrieve data from legacy systems that are unable to process modern protocols. Data grids support access by C library calls, Unix shell commands, Perl/Python/Windows load libraries, workflow systems, grid portals, Web browsers, digital libraries such as DSpace^[12] and Fedora,^[13] and Web service description languages (WSDL) across all storage systems where the software servers reside.

Data grids act as middleware, enabling the execution of the file-based and metadata-based operations required by data management applications. It is not sufficient to provide just the POSIX I/O operations supported by disk file systems (open, close, read, write, seek, stat, sync, etc.). Operations required for authenticity and integrity assurance, and network latency management are also needed. Since data grids manage distributed data, multiple levels of aggregation are needed to minimize the impact of the network latency caused by the finite speed of light. This is done by aggregating files before movement over the wide area network, aggregating metadata before movement and loading into a metadata catalog, and aggregating I/O commands into remote procedures that are executed at the remote storage system. In each case, the number of messages that are sent over the wide area network is minimized. This not only improves response time, but also improves scalability, enabling the manipulation of 1000 files at a time.

Trust Virtualization

The management of access controls at remote sites is possible if the data grid owns the data that are stored at each remote site. This means that data are written onto the remote storage system under an account that corresponds to the data grid. Persons accessing the data grid authenticate their identity to the data grid system. The data grid then checks whether they are authorized to perform the desired operation. If so, the data grid accesses the remote storage system on behalf of the user and performs the operation. Thus the data grid software servers must also map from requests made by a user to allowed operations on data that are stored under a data grid account. The trust virtualization mechanisms provide an additional level of authentication beyond the security mechanisms employed at each site. A desired impact is the ability to create a single sign-on environment. Once the user has authenticated their identity to the data grid, they can perform authorized operations on data anywhere within the data grid. They do not need to authenticate their identity at each remote storage system.

The data grid technology used to support each of the above application examples is the Storage Resource Broker (SRB), developed at the San Diego Supercomputer Center (SDSC).^[14] Each of the capabilities listed above is supported by the SRB, and is in production use. SRB data grids are typically implemented as federations of multiple independent data grids. Each data grid manages a local metadata catalog and multiple storage systems. Federation is the controlled sharing of name spaces between two or more data grids. A trust relationship is established between two data grids and the data grid administrators decide which of the name spaces will be shared. Different types of federation are then possible:^[15]

- Peer-to-peer data grids. None of the name spaces are shared. Instead a person can only access public data within the remote data grid.
- Central archive. Each data grid replicates a copy of their data onto the central archive, including both the files and the provenance metadata.
- Master-slave data grids. All data that reside in a slave data grid are distributed from the master data grid.
- Chained data grids. A data grid administrator pulls data and metadata successively from one data grid in a chain to the next. This is typically used in international collaborations that are managing replicas on different continents.
- Deep archives. The goal is to build a preservation environment that cannot be seen or accessed from a publicly accessible data grid. The approach requires the creation of a staging data grid between the public data grid and the deep archive. The administrator of the staging data grid pulls data from the public data grid to the staging data grid. The administrator of the deep archive then pulls data from the staging data grid into the deep archive. The result is that the identity of the deep archive administrator, the location of the deep archive, and the content of the deep archive cannot be seen from the public data grid.

Management Virtualization

The ability to automate the application of management policies in a distributed environment is critical to the ability to manage very large collections. As the size of collections grow, the validation of integrity and authenticity becomes onerous. Since a data grid is composed of storage systems in which failures might occur at any point in time,

both authenticity and integrity must be periodically reassessed, and recovery operations implemented to correct identified problems. Examples include replacement of a replica if a remote storage system crashes, validation of audit trails to prove that only the authorized administrators performed selected operations, and verification of checksums. Each time a problem is identified, the data grid should initiate the required management policy for recovery.

The automation of management policies is an active area of research. The approach taken by the integrated Rule-Oriented Data System (iRODS) under development UNC and UCSD^[16] is to differentiate between institutional policies, the management infrastructure needed to implement the policies, and the underlying data grid infrastructure that interacts with the remote storage system.^[17] Table 1 shows the additional levels of virtualization that are required.

Each community specifies the assessment criteria they use to validate properties about their data collections. Assessment criteria might be driven by measures of trustworthiness such as those proposed by the Research Libraries Group and the National Archives and Records Administration.^[18] The assessment criteria are mapped onto sets of persistent state information that can be compared to desired values. An example is assessment of risk mitigation against data loss, by requiring at least two copies of each file be stored on two different storage systems. The persistent state information for each file would need to include the number of copies and the location of each copy.

Each assessment criterion is maintained by management policies that control what can be done with the files. The management policies are mapped onto sets of rules that control the execution of the remote operations at each storage system. An example is a rule that automatically creates a replica of any file written to a specified collection. The capabilities needed to implement the management policies are mapped onto a set of remote microservices. Each microservice corresponds to a set of operations performed at the remote storage system. The rules are executed by a rule engine, and the resulting persistent state information is stored in a database. Data grid technology provides the infrastructure independence needed to deal with multiple types of databases and storage systems.

The choice of rules to apply is driven by a combination of the identity of the person requesting an operation, the collection that is being manipulated, and the storage

Table 1 Characterization of management policies and corresponding infrastructure

Data management environment	Conserved properties	Control mechanisms	Remote operations
Management functions	Assessment criteria	Management policies	Capabilities
Data management infrastructure	Persistent state	Rules	Remote microservices
Software infrastructure	Database	Rule engine	Storage system

system where the data resides. The ability to apply different rules for each operation means that operations required by the data grid administrator can be controlled independently of the operations that might be performed by a public user. The rules can be applied at the time of the requested operation, or deferred for later execution, or executed periodically to validate an assessment criterion.

Management virtualization requires the definition of three more logical name spaces. Within the iRODS system, logical name spaces are also provided for

- Rules—new versions of rules can be added
- Microservices—new versions of microservices can be added
- Persistent state information—additional persistent state information attributes can be added

By adding simultaneously the triplet of {rule, microservice, persistent state}, it is possible to control the evolution of the rule management system itself. New capabilities can be added and executed in parallel with old capabilities, since each new capability can reference a different set of rules, microservices, and state information. A metarule can be written that controls the migration of a collection from an old set of management policies to a new set of management policies.

A second desired capability is improved control of federations of data grid. Under the SRB data grid, authentication was done by the home data grid, but authorization was done by the remote data grid. In a rule-based environment, when data is replicated onto a second data grid, the controlling rules and microservices can also be replicated, implying that it is possible to build a federation environment in which the home data grid remains in control of how their files may be used, even then they are shared with other data grids.

Rule-based systems are optimized by minimizing the number of rules that are applied. This in turn requires defining the correct level of aggregation of remote operations into microservices, and the correct set of microservices for aggregation into capabilities. Microservices that only implement the basic POSIX I/O operations are too low a level for use by a data grid administrator. The number of commands that would need to be executed for a file-level operation become excessive. Fortunately, the operations supported by data grids provide a strong template for deciding how to aggregate operations. Within the SRB data grid, multiple levels of aggregation are used within each of the logical name spaces:

The SRB data grids support identification of users as an individual entity, as a member of a group, or as a member of a data grid within a federation. Storage resources can be referenced as single storage systems, or as a compound resource such as a disk cache in front of a tape archive, or as a cluster across which load leveling is done. Files can be manipulated as individual files, or after aggregation

- | | |
|-----------------------|--|
| • Users | {Single user, group, federation} |
| • Users | {Single user, group, federation} |
| • Resources | {Single storage system, compound resource, cluster} |
| • Files | {Single file, container, directory} |
| • Metadata | {Single attribute, hierarchical table, collection} |
| • Management policies | {Single capability, set of capabilities, nested rules} |

into a physical container, or recursively in a logical directory hierarchy. Metadata attributes can be manipulated as single attributes defined by a user, or through a hierarchical table structure that implements a snowflake schema, or as a collection containing multiple files. Management policies also have multiple levels of aggregation as rules controlling a single microservice, or a set of microservices, or in a recursive-nested hierarchy of rules and microservices.

By building microservices that manipulate each level of granularity, it becomes easier to map operations within the data grid to management policies. Analyses have been made of the capabilities required for the NARA Electronic Records Archive,^[19] and their mapping onto rules that can be implemented in the iRODS environment.^[20] The mapping identified over 170 rules that would be used to control either operations on records, or the manipulation of structured information. More than 200 persistent state information attributes were identified that were needed to express the results of applying the rules. A similar mapping has been made of the RLG/NARA assessment criteria for trusted digital repositories to iRODS rules and microservices. The assessment criteria comprised about 105 rules for the tracking of trustworthiness. Together, these two assessments provide a definition of the minimal rule set needed to manage distributed shared collections.

A second approach toward quantifying the required management policies for distributed shared collections is to examine the policies requested by production users of the SRB data grid technology. A generic set of 15 rules were identified that would allow each data grid administrator to implement the specific control policies they desired. These rules are primarily for the management of shared collections and include

- Administration—controlling the creation and deletion of users and collections
- Storage selection—controlling how physical resources are selected within a given logical resource name
- Data access—controlling the additional steps performed when data is read from a collection
- Data write—controlling the additional steps performed when data is added to a collection
- Transport—controlling the number of parallel I/O threads to use when moving data

- Deletion—controlling the operations performed when data is deleted

Thus it is possible to build the simple rule environments that meet the needs of today's production shared collections.

DATA MANAGEMENT TECHNOLOGIES

Many of the multiple data management systems currently under development have made explicit choices for the integration of management policies into their software systems. It is worthwhile to examine how their management policies have been implemented, and whether it is possible to integrate each of the approaches into a common system. Three notable systems are the Logistical Distribution Network,^[21] LOCKSS—Lots of Copies Keep Stuff Safe,^[22] and the Semantic Grid.^[23]

The Logistical Distribution Network uses the Internet Backplane Protocol to manage data at the block level. A file is broken up into multiple blocks, with the blocks distributed to multiple remote storage systems. The blocks are migrated between storage systems based on demand to keep the data close to the user. The blocks can also be replicated to support load balancing. A Logistical Distribution Network is designed to make very efficient use of the network bandwidth, and move data at rates approaching the network bandwidth using a single data stream. An interesting integration effort is the porting of data grid technology on top of a Logistical Distribution Network, with the data grid providing interoperability with archives and databases.

The LOCKSS system replicates data at the file level, assuming an authoritative source for the original ingestion of data into the system. The system is used to support data downloaded from publishers. Access control policies are implemented as modules controlling access for data received from each publisher. Integrity is managed by federating with preferably at least six other sites that have also downloaded the same files. A voting protocol between sites that have downloaded the same material is used to verify that each site's copy is authentic. This minimizes risk that operations by a local administrator have compromised the integrity and authenticity of files in a collection. Again, a research topic is the integration of a LOCKSS system with rule-based systems for automating application of additional management policies.

The Semantic Grid uses logical relationships between semantic terms to reason on inferred attributes about independent data collections. The logical relationships are organized in ontologies for each scientific domain. Semantic Grids apply the reasoning to data stored in multiple data grids to improve discovery of the desired data. An example of this is the integration of inference engines with SRB data grids, in a product called S-SRB.^[24]

SUMMARY

Data management systems are rapidly evolving from single site collections into distributed environments in which the data are stored across multiple systems. The initial SRB data grid technology supported shared data collections and provided the essential virtualization mechanisms needed to manage and manipulate distributed data for digital libraries and persistent archives.^[25] The next generation of rule-based data management systems will automate the application of management policies, minimizing the amount of labor needed to build and maintain a shared collection. Rule-based systems have the attraction of being able to manage their own evolution, directly associate allowed operations (microservices) with individual files or collections, and apply access controls even in federated environments. Given the expected emergence of data format description languages that will characterize structures in data, rule-based systems will be able to apply access controls on structures within files, enabling the automated redaction of data files. The drive for the creation of rule-based systems is coming from the massive collections that will appear in the next 5–10 years. Without rule-based data management systems, the labor requirements for assessing integrity and authenticity will not be possible to sustain.

ACKNOWLEDGMENT

The principle developers of the SRB and iRODS technology are Michael Wan (UCSD), Arcot Rajasekar (UNC), and Wayne Schroeder (UCSD), of the San Diego Supercomputer Center. This work was supported in part by the NSF ITR grant on Constraint-based Knowledge Systems for Grids, Digital Libraries, and Persistent Archives, the NSF SCI0438741 (National Archives and Records Administration research prototype persistent archive supplement), and the Lawrence Livermore National Laboratory project with UCSD on Scientific Data. Managing an Information Business

Gloria Dinerman

The Library Co-Op, Inc., Edison, New Jersey, U.S.A.

Abstract

This entry provides an outline that may be used to assist an information specialist who is contemplating going into business. It focuses on the management process, as well as emphasizing strategic details that are often overlooked by librarians as they expand their sites into a new dimension.

INTRODUCTION

The skill set required to be a successful entrepreneur is different from the ability to explore the intricacies of scholarly research or the detailed skills of indexing, cataloging, and other technological proficiencies. The librarian in a corporate or academic setting has only to think about the work at hand and the attendant concerns that challenge day-to-day duties, but a librarian in the competition of the business world has to perform many additional tasks that are far removed from the searching and disseminating of information. The realization that mundane duties are an integral part of being self-employed takes on important significance and may require some introspection before changing direction from employee to employer.

The following competencies are vital for success:

1. The ability to schedule time to include office details as well as professional production.
2. The character to develop the mental toughness to withstand adversity.
3. The aptitude to set priorities without getting buried in mundane details.
4. The stamina and the drive to survive the first year in business.
5. The resources to call for assistance, if needed, and the independence to stand alone.

MANAGING TIME

The organization of time should include completion of work on hand, business development, follow-up, technical reading, meetings, networking, social engagements, personal downtime, and the flexibility to ride the tide of the unexpected.

You may want to construct your work week on a calendar, first notating all activities that are preplanned such as meetings, appointments, classes, and research. Allow part of each day for production, preferably allocating the same

hours to regulate a schedule. Then fill in the rest of the week with other duties such as clerical, e-mail, telephone responses, etc. Each specific task is then accounted for even though the time spent may change.

Another method of managing time is to set up the week like a budget, but instead of using numbers, use hours as the unit of calculation.

Example—Working a 50-hour week

25 hours—work in progress
5 hours—marketing/business development
5 hours—e-mail, telephone, correspondence etc.
5 hours—meetings
3 hours—professional reading
2 hours—networking
5 hours—clerical (accounts payable, ordering supplies, reviewing mail, billing your accounts, etc.)

Try to keep phone calls short, covering the salient points of the conversation with direct questions or responses, and personal calls should be kept to a minimum. When working with a new client, request the best time to return calls or whether they would prefer to be contacted through e-mail. Many people prefer calls early in the day, others in late afternoon. Keep a profile sheet online with client preferences and, until it is committed to memory, have it open whenever you are on the phone. A good program to use is ACT; it is simple and inexpensive, with all the features built in for ready reference. Becoming overwhelmed with minor details is a common error of the single business owner. As soon as it is economically possible after the business has been opened, consider hiring a part-time person to do the routine clerical work and save your time for the professional duties.

The economic reality of employing a clerical assistant is that it maximizes the value of your production. Professional income may range between \$50 and \$100 per hour. Clerical wages usually fall between \$15 and \$25 per hour. The more work an office assistant can accomplish, the more time the professional is free to earn the income commensurate with their skill level.

Local centers of education are the best sources for recruiting office personnel because guidance teachers and career instructors are available for references and suggestions. Writing a job description is essential, clearly stating responsibilities, skill level, salary, and hours.

Try to avoid spending time worrying about a business situation over which you have no control. Excessive concern is counterproductive because energy is sapped by negativity. If a contract has been lost to a competitor, get as much information as possible as to the reason for the decision, so that errors become a learning experience.

Vigilantly scrutinize for burnout and loss of creativity. If time gets out of control, step back and reassess the productivity level, paying particular concern to deadlines and job satisfaction.

The business of information is dynamic in its structure, and there will always be changes in the process of building a foundation for success.

UNDERSTANDING PRIORITIES

Setting priorities can be exclusive and personal. At the outset, it would seem that work is scheduled in the order in which it was received, but this logic is not necessarily best for business. If a large and loyal account wants special treatment, that request should be honored. Rush jobs might take priority, particularly if there is extra compensation attached to the task. When a new account that has the potential for continued business asks for a quick turnaround, that request can be honored. Trying to please everyone is impossible, but the ability to please most people comes with experience. Do not be afraid to ask questions that will make your job easier.

Every job requires a reference interview, basic in our profession. When developing a business, is it more profitable to seek one or two large accounts, or should priority be given to the expansion of a large and possibly diverse client base? The decision depends on the comfort level of the owner. Some professionals leave a job only to become a consultant for their former employers and the fact that they have a ready-made client fosters a false sense of security. That company can relocate, hire another associate, restructure their management responsibilities, merge with a competitor, go out of business, or institute a combination of changes that unfortunately do not include their independent consultants. It is a safer business practice to vend your services to a number of different users and cultivate a list of references that can be cited whenever there is a call for services. Rarely should priority status be given to a job as a favor to a friend. You have no friends in business, only professional acquaintances.

The following suggestions summarize considerations for establishing production priorities:

- Which account is most loyal?
- What work is for a new account?
- Which account has consistently come forth with repeat business?
- What requests were on the books first?
- What job is the largest in terms of gross dollars?
- What work will bring in the greatest margin of profit?
- What work will take the longest or shortest time to complete?
- Can any of the work be delegated?

There are other types of priorities that come under consideration when starting a business. The appearance of your workplace demands attention, particularly if you plan to entertain clients. A home office should have the look and feel of an office outside your residence. Surroundings make a difference in how you perceive yourself, and you want to feel like a successful owner. Even if the area is small, or if you have to share space, segregate your furnishings so that the room or part thereof is designated exclusively for business use. If your office is private, adequate file space, seating, and lighting should be in place before the door is open for business.

Setting priorities requires logical thinking, personal preferences, evaluation, and organizational understanding.

WHEN THE CASH FLOW GETS CLOGGED

The definition of cash flow is the money that actually is received in the office. Billing, accounts payable, and contract assignments are all promises of money earned, but until it is in the bank, it cannot pay bills, salaries, utilities, or any of the other expenses that are inherent to running a business.

If \$5000 per month is billed, if ordinary expenses run \$4000 per month, and if \$3500 per month is paid in, there is a negative cash flow of \$500 per month. Simply stated, this is why a reserve is essential.

A small business may often be on the verge of bankruptcy because the owner is not alert to financial planning. Suggestions to help you to maintain solvency are as follows:

- When starting your business, have enough ready cash on hand to sustain your lifestyle for at least 1 year.
- Have enough ready cash to pay basic office expenses for at least 1 year.
- Be aware that most accounts do not pay on time—that is, within 30 days.
- Be aware that even though you might want to add interest to your billing after 30 days, you probably will not be able to collect it.
- Good work and prompt delivery are not always followed by rapid payment. Corporations earn millions of dollars by not paying their bills on time.
- It might be necessary to engage a collection agency. Agencies work on a contingency basis and usually

charge between one-third and one-half of the money collected.

- Never work without a purchase order or an authorization in writing signed by someone in authority. You have no friends in business. The number on the purchase order may be needed to track payments to your company.
- As a nonessential service provider, payment to a library consultant is not a priority for the corporate account. The longer a company keeps its money and invests what it keeps at even a nominal rate of interest, the more money it earns at the expense of the small contractor.

Eventually, however, the payment comes through. To expedite cash flow:

- Bill immediately upon the completion of a job. Make this clerical work a priority.
- Ascertain the recipient of the invoices—phone number and e-mail.
- If payment is a day past 30 days, send a second notice.
- Two weeks later, send a third notice (return receipt requested).
- When you build up a reserve in your corporate account, put any excess that is not needed for monthly expenses into an interest-bearing instrument or a money market account. Do not let it sit without drawing some interest.
- Establish a line of credit with your bank, in case of emergency.
- Pay bills on the last day of the month.
- If possible, save purchases for the end of December or the beginning of January. Most companies clear their payables by the end of the year, and the best buys on equipment and supplies are during the start of the new year.

To expedite the flow of cash into a business account, there are a few strategies that produce results:

- Establish a FedEx account and have clients use your number to send payment.
- Request direct deposits from the client's bank directly into yours.
- If a check has to be mailed, request second-day air delivery.
- Request a wire transfer of funds.
- Pick up the check personally if the location is within easy driving distance.

INVESTMENTS

The disposition of money must be included as a major part of any business plan. However, investing is not to be confused with speculation. Whatever amount is put to

work in a safe haven, the principal should be risk-free. Whether interest rates are low or high, the extra earnings can compound into a considerable sum at the end of the year. To maximize earnings, checks should be deposited into a savings account as soon as they come in.

Arrange to transfer funds into a checking account on an "as-needed" basis. The most efficient way to accomplish this transfer is to have both the savings account and checking account in the same bank, making sure to ascertain the length of time needed to be able to use the proceeds.

When there is enough available money in the account to sustain the business for 2 or more months, it is time to purchase other types of investments. Bank Certificates of Deposit yield more interest than a savings account, but if you redeem before maturity there will be a penalty. These short-term instruments have a fixed maturity date and the interest is fixed at the time of purchase.

If you have accumulated \$10,000 or more, U.S. treasury bills are safe, readily available, and generally provide a higher yield than Certificates of Deposit. These bills are issued by the U.S. government and can be bought through a commercial bank or brokerage house. The percent of interest given to investors is controlled by the Federal Reserve Open Market Committee, which meets at least once every 3 months. Interest rates are pegged downward, usually by one-quarter of a percentage point at a time, to stimulate the economy and conversely, the rates are increased when there is a danger of inflation.

The manipulation of the prime rate is an economic control that is perceived to work. When interest rates go down, the cost of borrowing becomes cheaper, more projects are expanded, new equipment is purchased, more people are put to work, and as purchases are made, the economy flourishes. When interest rates rise, goods and services become more expensive, buying may be curtailed, and the economy slows.

People have a tendency to think that investing is only for those with high incomes, but even a modest investment is a beginning. Translate earnings into practical purchasing. If you received only \$20 the first year, that could buy \$20 worth of copy paper, part of a lunch tab with a client, money toward your phone bill, or other purchases of importance. Money earned is working for your benefit.

Federal government securities, such as Federal National Mortgage Association or Government National Mortgage Association, yield more than certificates and bills, and the rate is fixed for a longer period of time. These instruments are safe and pay interest monthly or quarterly, depending on your particular investment and can be readily sold if the invested principal is needed. There is a plethora of advice that is given in the name of "reliable information," and much of it will benefit the sales representative more than it will the investor. Banks or large brokerage houses employ their own researchers to help both customers and representatives, and even though

a commission is charged on each transaction the advice that is received is well worth the payment.

MARKETING

Marketing is the strategy and the resultant action of promoting a business. The difference between advertising, selling, and marketing is:

- Advertising is when there is a purchase of airtime, print space, billboards, or other types of promotion to display a product or service.
- Selling involves person-to-person contact. If someone calls about your service, if a casual meeting leads to a work assignment, or if persuasion will increase the scope of a contract, these are the circumstances that create a selling experience.
- Marketing is spreading the word that you are in business and that you are the best at it. Marketing demands confidence. To convince others that the service you provide is essential, you have to truly believe in yourself. Put very simply, when you go to the store and are given a sample of a product, that is marketing. When the person who gave you the product starts a sales talk, that is selling. When you get a coupon for the product, that is advertising.

Asking for a recommendation from a satisfied client is a simple marketing tool, as is giving a lecture or demonstration, or hosting a booth at a conference. Somewhat more difficult is cold calling or using mailing lists. The average positive response is from 2% to 5%, and it takes a tremendous number of contacts to produce a worthwhile return. With electronic communication becoming ever more important to business promotion, developing a website and keeping it current is excellent for marketing a new venture. Business cannot succeed unless your potential clients know about your work.

Professionals often make the mistake of thinking that, because they are lucky enough to start a business with one or two promised accounts, their services will always be needed. In the brokerage business, an often-quoted maxim is “you are only as good as your last trade.” To paraphrase the adage, “a good reputation must be constantly renewed.”

Marketing takes a lot of time and careful planning. In a niche business, services rendered do not appeal to a huge market. When you plan your campaign, the first workable solution might be the methodology of contacting the obvious customers and most likely users. Then stretch your imagination to explore and identify other markets where competitors have not yet saturated the field.

Networking is essential. There will always be colleagues promoting allied endeavors where you may be able to dovetail your expertise. Talk to people—anyone.

Let them know you are in business. Even if they can never become an account, they might have a friend or relative who is waiting to be shown your talent. Talking to seat-mates on planes and trains is ideal for this type of conversation.

Try to market every day, even if only one new contact is developed. This effort keeps the name of the company in front of the potential audience so that you will be recognized. Think about brochures and business cards, and how to coordinate the color scheme and legend with your website. Keep it simple, attractive, and uncluttered.

The world of commerce is constantly changing, sometimes for the better and sometimes into stagnation or recession. When you plan for difficult times, the good times take care of themselves. The core of planning is keeping alert to opportunities to spread the word about your services and to follow up on all leads that might be fruitful. Keep a record of names, places, e-mail, and results of every conversation. Rejection will come followed by discouragement, but let discouragement build determination and let that determination become the driving force toward your goal.

Train yourself to be alert to new developments and innovative technologies, not only in the profession of librarianship, but more so in the broader outlook of the global economy. Imagine how you can service new clients by employing the most modern methodology and technical acumen to your work. The more you expand your depth of knowledge, the more prestige you bring to your talent.

HIRING AND FIRING—THE PEOPLE PROBLEM

Unless you expect to be a self-employed solo librarian, the time will come when help will have to be hired, either to take care of some of the routine work, to assist you on special projects, or to add another dimension to the company. When you retain more people, there is always the possibility that you will be forced to fire an employee who has proved to be unsatisfactory. Hiring and firing are both difficult and even traumatic because there are no guarantees that the right decision was made.

Hiring

Have a clear idea of where help is most needed, and write a job description that is detailed and simple to read. Put the duties in priority order according to importance to the company and according to the skill level at which you expect the person to operate. State number of hours per week, hourly or weekly wage, whether the job is temporary or permanent, holidays, vacation time, benefits, and whether you are willing to support working on a flexible schedule. Include training, if any.

Hours of interviewing will not produce the perfect candidate, and a resume is descriptive only of education and experience. Working with someone is the only way to ascertain if each personality blends with the other.

It is recommended that a telephone interview be conducted first to find if your candidate speaks clearly, responds literally, and understands your requirements. Write out questions that are relevant to the job and record the answers for later evaluation. Also grade your overall impression of the applicant. When the phone interview agrees with the personal interview, that person should be strongly considered.

When hiring someone for office detail, the writing of a clear and concise e-mail message takes on new importance. If you are out of the office on an assignment or at a conference, it is essential for client relations to have someone who can be responsive to the needs of your accounts and be able to convey any messages necessary to continue business in your absence.

Training someone with potential may be preferable to hiring someone with experience. As long as the candidate is intelligent, flexible, willing, and has no personality problems that will interfere with performance, honing the skills and teaching priorities will create an adaptive and eager employee. The argument against training is that it takes too long to bring someone up to speed. This is fallacious thinking because the most loyal and dedicated employees are those that come up from the ranks, regardless of the nature of the company.

If possible, hire on a 3-month trial basis. At the end of that time, meet with the candidate and discuss problems or revisions in the job description; then both of you can make a determination if the job and job performance has been satisfactory and whether the relationship should continue.

Many people, especially those who are well educated, become disenchanted with their work because they are not given enough responsibility. If you have hired correctly, there should be a gradual assigning of more difficult duties so that your own workload can be relieved of some managerial obligations. Be secure enough in your own ability to disengage the minor details of running an office.

When you are in a small office, it may be tempting and almost natural to become friends with your co-workers. DON'T. You have only one role—that of boss or supervisor. You are not a buddy, confessor, family counselor, banker, or broker. If you mix up your own job description, the boundaries get blurred and you lose control, discipline, and importance.

Firing

If you find that a mistake has been made in hiring, cut your losses quickly. Letting someone go for cause is most difficult because you have to be cautious not to infringe on the human rights that dominate today's personnel regulations.

Years ago, a person was generally given a week or two to finalize the work at hand before leaving the company, but giving a long notice time builds up more resentment as the days pass. Now, it is preferable to speak in a private conference, explain the reason for the decision, and then say good-bye. Keep it simple. Keep it professional. Above all, do not argue and do not change your mind.

Expect a challenge to your decision and be prepared. Rehearse in your mind what you are going to say and keep to the scenario. Even though you may not have an answer for every possible question, you are still the boss and the buck stops at your desk. Do not be persuaded to award a second chance because in the long run it will not work, the same difficulties will surface and you will be faced with firing the same person twice.

Surprisingly enough, even though a person has been let go, they may give you as a reference when applying for another job. This is a real dilemma. You do not want to compromise your integrity by glossing over inadequacies; yet, you cannot leave yourself open to any legal action. The law only requires you to say that the person worked for you during the time that is stated on the application. After that you do not have to commit to any other information. The standard questions are "Was the work satisfactory?," "Would you hire this person again?," "What was the reason for the separation?," and "Were there any glaring problems?" Be evasive on all the above.

CONTRACTS

Of all the bits of knowledge associated with starting a business, the least familiar to librarians is arguably working with the details of contracts. Many jobs will be sealed with a handshake or even an okay over the phone. Many others will require a contract, defining the scope of work in explicit detail, and some will only need a letter of confirmation.

Whatever the parameters of the job, regardless of the person or corporation who requested the services, each deliverable should be stated in clear language. It should be a policy decision never to work without a purchase order or something in writing authorizing you to proceed. A formal contract may not be necessary, but the authorization should contain at minimum the scope of work, total payment amount, start date, terms of payment, and who will sign off on the work. If the contract is large, it should also state what is not covered (i.e., indexing but not abstracting, research but not a synopsis, editing but not proofreading, copy cataloging but not original cataloging). The services of an attorney might be worthwhile to ensure that you are properly protected.

In spite of careful scrutiny of the terms of the contract, you might be asked to do work that is beyond that to which you originally agreed. At that time, you will have to decide whether to ask for an additional fee. The request

could involve nothing more than a small item that will make the deliverable better. Four questions to be answered: “Will the additional work earn more business?,” “Is it worth doing for public relations?,” “Will there be a sterling recommendation at the completion of the job?,” and “Is the account taking advantage of my lack of business experience?”

If there is any doubt about how to proceed, imagine what IBM would do. When you are in business, it is incumbent upon you to conduct your business like a chief financial officer. When figuring the cost of a job, there are several components to be considered before arriving at a total. Estimate the time it will take to complete; add any staff or clerical time; and estimate cost of travel, FedEx, subsistence if going out of your commuting range, overhead, margin of profit and 5% to 10% of the entire cost for contingencies. Whether the charge is 5% or 10% can depend on whether the work is for a new account or one with a prior business history; whether the work is difficult or detailed, where there could be a substantial margin for error; whether there is a strong possibility of hidden expenses; or whether the account have made prior requests for additional work at no cost.

If a contract requires an addendum, you can:

- Prepare the revisions yourself and submit the changes for approval.
- Request that the account write the revisions and submit them to you for approval.
- Submit the change order to your attorney and have the attorney review it for approval.

If you believe that working with contracts will be a large part of your business and if the nature of your business does not vary substantially from job to job, it might be preferable for an attorney to prepare a boilerplate contract for you to use and modify as needed. Then you can be relatively sure that most of the essential points will always be covered.

Government contracts can be the most difficult to understand, and bidding on government jobs is extremely competitive, regardless of the protestations that they want to cater to women and minority vendors. It can take months to get an award and payments are slow. However, government contracts are large, and there is money to be made if you are careful when drawing your estimates. Sometimes an on-site visit is required, and sometimes a bond has to be posted. Proof of insurance is always required. Before you take the time to develop a proposal for any contract, weigh the risk against the rewards. There is no greater personal satisfaction than in growing a successful business. No detailed and difficult assignment that has ever been completed for an employer compares with the gratification you get when that first check is deposited into your own business account. There is no greater thrill than in seeing one of your ideas transform from a thought

into a reality—without committees, without meetings, without administrative delays. By working your own business, you may be giving up security and gaining independence. You change from a worker into an entrepreneur, from an “extra” into a star, from one of the crowd to one of a kind.

There will be jealousies and joys, loneliness and laughter, and the worst and the best of the commercial world. It takes courage to be a success.

Abstract

After introductory remarks on the definition of marketing, the evolution of library and information services (LIS) marketing is explained. The authors then describe how marketing was applied to LIS over the years. Marketing is also related to other concepts used in the management of LIS. Finally the role of professional associations in diffusing marketing theory is portrayed and the importance of education addressed. The entry ends with a reflection on the future of marketing for LIS.

INTRODUCTION

It is widely admitted that libraries and archives have for a very long time suffered from their image and visibility problems. This is probably why many librarians and archivists now see marketing as a very important topic; for example, in a survey conducted in Canada in 1997,^[1] 84.4% of the respondents answered that marketing is important or very important for library and information services (LIS). Similar results were observed earlier in the United Kingdom.^[2]

Many also think that marketing is a new issue for LIS, something that only emerged during the last three decades. Although marketing was more formally introduced in the profession after the 1970s it is interesting to know that in North America at least, librarians adopted marketing techniques as early as 1876, as Kleindl (a marketing professor, illustrated how libraries at this stage were innovative in many marketing strategies: segmenting and targeting clientele, using publicity, direct mail, streetcar signs, telephone solicitation, banners, etc. The twentieth-century library, the progressive library, would throw its doors open to all and encourage them to come in and join in the building of a community cultural center)^[3] and Renberg (who traces history of marketing since 1876 and goes till formal marketing starts taking place in 1970, confirms the occurrences of terms such as, advertising in 1896, management in 1897, outreach in 1903, and extension work in 1909, in library literature, mainly in public libraries)^[4] demonstrated in their articles.

However, what is true about marketing in general is the confusion concerning the concept itself. Most people seem to see marketing only as the equivalent to advertising or promotion: they do not see “what’s below ‘the tip of the iceberg.’” To use this analogy, what is below the surface in marketing theory includes important strategic components

such as evaluating the needs of the customer; planning the various elements of the mix in order to answer those needs; and periodically evaluating the results. While this is the most commonly accepted framework of marketing, over the years, marketing activities have expanded from being assigned to one designated “marketing department” to becoming an overall organizational function. This, in turn, requires the involvement of everyone in the organization, and thus it becomes integral to the philosophy of the whole organization.

MARKETING REDEFINED

Marketing has been defined and explained in many ways by different marketing authors. Though the definitions given by the American Marketing Association (AMA) and The Chartered Institute of Marketing (CIM) have been widely accepted over the years, but are redefined time and again. The National Association of Marketing Teachers, a predecessor of the AMA, adopted what seems to be the first official definition of marketing in 1935:^[5] “Marketing is the performance of business activities that direct the flow of goods and services from producer to consumers.” The AMA adopted the 1935 definition in 1948, and in 1960 when the AMA revisited the definition it was decided not to change it. This original definition stood for 50 years, until it was revised in 1985, as: “Marketing consists of individual and organizational activities that facilitate and expedite exchange relationships in a dynamic environment through the creation, servicing, distribution, promotion and pricing of goods, services, and ideas.” Again in 2004, the AMA the definition was revised to read: “Marketing is an organizational function and a set of processes for creating, communicating and delivering value to customers and for managing customer

relationships in ways that benefit the organization and its stakeholders.”

Examination of these three definitions reveals a change of focus over the time. The first definition of marketing embraced all the business activities involved in getting commodities of all kinds, including services, from the hands of producers and manufacturers into the hands of the final consumers. It focused significant attention on the distribution functions. The 1985 modification of the definition was a significant one, turning attention squarely toward the managerial tasks. The emphasis was put on how the individual organizational processes, marketing and developing the strategic dimensions of marketing activities.

In 2004, while there is still an emphasis on process—that is fundamental to marketing—one can see the transition in the focus areas: the use of the words “value,” “managing customer relationships,” and “stakeholders” being brought to the center stage in this definition. Gupta^[6] contends that this definition sets many new dimensions to marketing concept—the emphasis is on that:

- Marketing serves as the overriding philosophy in conducting marketing task in the organization as a whole.
- It is a set of processes; process involves interactions among people, technology, methods, procedure, environment, and material (information or information sources in case of libraries), by which any offer comes to the customer.
- Value is the basket of benefits or utilities which a user or customer gets while using a product or service. Value is clearly communicated to customers so that it can be understood easily.
- A long-term relationship is developed among customers and marketers through deep understanding, reciprocal dependency, and mutual trust.
- Relationship is substantially beneficial to both the parties. From the organization’s point of view, relationship is a tactical issue, but for customers, it is just a communication process.

Thus, the 2004 definition not only extends managerial dynamics but also goes on to delimit marketing to a singular focus on the individual customers, stakeholders, and the organization.

Similarly, CIM defined marketing in 1976, as, “Marketing is the management process which identifies, anticipate and supplies customer requirements efficiently and profitably.” CIM proposes to redefine marketing in 2007,^[7] as

The strategic business function that creates value by stimulating, facilitating, and fulfilling customer demand. It does this by building brands, nurturing innovation, developing relationships, creating good customer service and

communicating benefits. By operating customer-centrally, marketing brings positive return on investment, satisfies shareholders and stake-holders from business and the community, and contributes to positive behavioural change and a sustainable business future.

While there are differences between the definitions given above it is important to state that definitions of marketing change as a result of environmental changes, or because our knowledge of the subject improves, or indeed through a combination of these two reasons. Marketing as a subject or discipline is therefore evolving as explained by Cooke et al.^[8] What is important to remember is the notion of managing the exchange process between an organization and its publics with a view to developing relationships between both the parties is at the heart of marketing. It involves philosophical thinking, strategic outlook, and operational tactics for LIS, thus clearly putting marketing above simple advertising, promotion, or public relations part of marketing.

ORIGIN AND HISTORY OF LIS MARKETING

Early Marketing Efforts in Libraries (Prior to 1920)

Historically, one can easily find the roots of library marketing in the attempts to extend opening hours of libraries in the United States during last quarter of the twentieth century and in efforts to make books available in locations outside the library building. Samuel Swett Green advocated marketing the library through reference services in his article, “Personal Relations between Librarians and Readers,”^[9] which appeared in 1876 in the *American Library Journal* (later known simply as *Library Journal*). Green also spread his message through the American Library Association (ALA) conferences and meetings. Somewhat later, portable libraries were introduced in the Light-House Establishment and these were provided to all light vessels and inaccessible offshore light stations in an attempt to meet out the reading needs of the community residing in distant locations. The books were carefully selected from a list of books of a good quality appropriate to the families who would use them.^[10] Melvil Dewey and others advocated for traveling libraries which were small rotating collections that provided a means for extending library service to rural areas. These small libraries (usually from 30 to a 100 books) were located in a post office or store with a volunteer acting as the caretaker of the collection.^[11] Such initiatives that also took place in other countries (India, Canada, France, etc.) can be considered as concrete marketing efforts.

John Cotton Dana

was a pioneer in what we now call public relations, marketing, and other promotional activities. He was an early practitioner of needs assessment, defining target

audiences, goal setting, planning, and evaluation that could be quantified. He saw performance in numbers and in customer satisfaction. If readers liked a service he made sure others knew about it. If he added a new service—like creating separate children's libraries or business libraries—he made sure everyone had an opportunity to learn of it. He used newsletters, pamphlets, posters, flyers, exhibits, newspaper announcements and speeches to groups, and special events to publicize library events and encourage library use. He urged librarians to better understand their institutions from the patron's perspective—to put themselves in the worlds of actual and potential users.^[12]

(Reference^[12] has bibliography of publications about Dana, important ones include works by John Cotton Dana^[13] and Mattson and Eldredge.^[14]) He emphasized for specialized libraries for special kind of users and the concept of special libraries came in the beginning of the twentieth century that led to formation of Special Libraries Association (SLA) in 1909. Dana became the founder President of the SLA and later he became President of ALA. ALA started a Public Relations Award in his name in 1946. It is also important to note that to further the idea of outreach, the SLA in cooperation with other library associations organized numerous activities to celebrate "Library Week" during June 26–July 01, 1916.

Thus, during this period, the books themselves were considered the product, and place was emphasized for utilizing library services through space utilities, extended opening hours, and mobile library services. The open access system started which allowed users the freedom to move around the collection and make their own selection of material to consult on the premises or to borrow. Similarly, librarians started using terminologies related to communication, viz., advertising, publicity, and exhibit. Such development was limited to public libraries. Work related to compilation of bibliographies, documentation, and user-based services started taking place in libraries in early twentieth century, as librarians became more proactive and shifted their focus to individuals and their specific information needs.

From Publicity to Promotion (1920–1969)

By the 1920s the library movement had started in many countries. Many national and international professional associations (including IFLA, 1927) came into existence during this period and their work improved the overall situation of libraries and librarianship world over. There is evidence that special libraries, school libraries, and other libraries started taking keen interest in marketing-related activities.

During this period, a series of articles appeared in the SLA's magazine *Special Libraries*. Special library and information professionals themselves started taking interest in marketing their services by highlighting the

importance of promotion through exhibitions. In addition to the widespread use of displays, special librarians used public relations to attract help from the authorities and institutions; they also engaged in extension activities and in many other aspects of marketing that served to strengthen library–user relations. Some other themes addressed in *Special Libraries* include Selling the Special Library Idea; how can we sell ourselves to our organization; budgeting; in inside publicity and exhibit and exhibits.

Several books on specific aspects of marketing were also published during this period, including a 1921 manual by W. A. Briscoe entitled "*Library Advertising: 'Publicity' Methods for Public Libraries, Library-Work with Children, Rural Library Schemes*"; this book also had a chapter on the cinema and library in 1921.^[15] This work foreshadows some of the strategies advocated even today, such as targeting library newsletters at different groups, and having tie-ins with films.

Ranganathan's famous *Five Laws of Library Science*^[16] was published in 1931. The Five laws have been discussed in the light of marketing by many authors. Interestingly, these laws can be said to be relatively well aligned to marketing theory. From these laws logical corollaries are derived that can be directly related to marketing. (See Table 1 below.) The reader (sometimes called the customer) is king, and is the focal point of the library; thus the whole organization (resources, services, facilities, rules and regulations, procedures) becomes customer focused. As the table below demonstrates, each of these laws has important implications in regard to basic marketing strategies.^[17]

T. D. Wilson finds that although user studies started around 1948 they did not become a hot topic in LIS until the 1960s (Wilson considers that the "starting point of user studies to be the individual information user who, in response to some perceived 'need' engages in information-seeking behaviour."^[18] Although linked to marketing because of the interest in a better customer knowledge, in many cases user studies merely describe information habits and do not explain the decision-making process behind information strategies. In order to evaluate service vis-à-vis outcome performance, new measurement techniques began to be developed in the 1950s. The bibliography by Atkin^[19] and the survey by Nobel and Layzellward^[20] cover much of the literature published on performance measurement during 1950–1970. However the concept of customer satisfaction broadened and changed by the 1970s.^[21] (Nahl mentions that library managers started acquiring an understanding of how the user-centeredness can be embedded in the culture of services via strategic and operational management and summarizes eleven user-centered principles). Prior to this time, it would be fair to say that service provision was professionally determined and system centered rather than customer driven. As a result, the measurement of

Table 1 Five laws and marketing implications.

The law	Actions to be taken	Marketing implications
Books are for use	Optimum use of resources, facilities, and services.	Acquiring appropriate information material and ensuring sufficient resources and services are available for the use of users. Convenient location, effective signage, and longer opening hours; helping hands for using resources and services.
Every reader his/her book	Meeting users need satisfactorily	Collecting and interpreting information, understanding the needs of users, and matching with the organizational resources.
Every book its reader	Reaching out to users	Publicizing value and benefits, promotional campaign, advocacy, public relations, personal communication, etc.
Save the time of user	User benefits and preferences	Repackaging information into appropriate form, availability of information when they need. Ensuring quality of services and offerings.
Library is a growing organism	Adapting to future user needs	Mobilizing resources, dealing with uncertainty about future user needs, new services, new customer groups, new environment, etc.

performance has shifted from input to output: books borrowed, articles photocopied, items consulted, demands met, market penetration, and more subjectively perceived satisfaction.

In conclusion, between the 1920s until the early 1970s, aside from special libraries most libraries, archives, and information services did not see much, if any, need to market their products and services. Most marketing-related documentation in the field of librarianship had been presented under such labels, as user needs, user training, performance measurement, and economics of information, and efforts toward promotion, public relations, selling, and related concepts.

Library Marketing: The Formal Beginning

At the end of the 1960s, the world famous marketing author Philip Kotler and his colleague, Sidney Levy, published a landmark paper entitled: "Broadening the Concept of Marketing"^[22] In this 1969 paper Kotler and Levy suggested new avenues for marketing in nonprofit organizations. This marked a change among the marketing specialists who had previously considered marketing mainly as the field of commercial organizations. In the 1970s, marketing in nonprofit organizations and the associated areas of public sector and social marketing received a lot of attention. At the same time, LIS managers witnessed a kind of formalization process concerning the marketing of LIS. Indeed a number of important trends occurred in marketing of LIS during the last three decades.

First, the concept of "marketing mix" emerged and became the most popular concept in LIS marketing. The marketing mix is commonly referred to the four Ps of marketing—product, price, place, and promotion. This is a simple, yet effective means of considering the key elements necessary and the emphasis to be placed on each, in order to effectively implement any marketing strategy. The mix still provides a useful framework for thinking about ways in which an organization's marketing strategy is implemented. Writings related to pricing or charging fees for library services also started to appear, thus the

pricing aspect of marketing started getting attention in library and information centers.

Within the last 5 years the library community demonstrated a growing interest in marketing information products and services. Nevertheless, the approach to marketing in the LIS field continues to be characterized by a high degree of fragmentation. Surveys of information needs, wants, use, and satisfaction are important kinds of knowledge for a library and represent an element of marketing. However, the LIS approach has often been limited to disseminating information about library services and programs; this represents only a single aspect of marketing, and ignores product, pricing, and distribution activities. The majority of marketing-related work done in libraries has concentrated on one (or at best a couple), of these elements of marketing, and need to be melded into a coherent marketing program that is integrated into the organizational structure of the library. In 1977, the Library Association of the United Kingdom published the first simplified text which was entitled *Marketing the Library*.^[23] In this work, by A. Yorke, he affirms that libraries and marketing are compatible and explains similarities which do exist between a library and most other organizations irrespective of the field of activity in which they are operating; Yorke also attempts to show how the library should try to organize itself and its activities from a marketing point of view and looks into future.

In 1981, Blaise Cronin^[24] compiled a famous set of marketing papers for the Association of Special Libraries and Information Bureaux (ASLIB). This book covered topics such as marketing myopia; broadening the concept of marketing; marketing for nonprofit organizations; and strategies for introducing marketing into nonprofit organizations. It also reprinted quality papers published over library marketing during last two decades. It was only in the 1980s that marketing of services started to attract the attention of information professionals. The difference between products and services were repeatedly highlighted and finally the features of the service category (intangibility, inseparability, heterogeneity, and perishability) were established. The new three Ps—people, process, and physical evidence—became equally important;

writers who discuss these new three mix consider a range of aspects concerning marketing of services and also reflect on how they interact with each other. However, there is a continual debate whether the marketing mix is relevant in the present. Sueli Ferreira in her paper “4Ps Concept in LIS Literature”^[25] addressed the extension of the marketing mix in library literature during 1975–1995: she concluded that although “the four Ps can be an important tool to help librarians to understand information agencies as a ‘business’, librarians need to overcome the concept and go out of the four walls of the information agencies to guarantee the future of these organizations.”

Another significant trend noted during 1980s is the combining of strategic planning and marketing. In 1983, Wood wrote an article “Strategic Planning and the Marketing Process: Library Applications,”^[26] in which she stressed providing programs which support the library’s mission. She considered that libraries must consider adopting business concepts, such as marketing and strategic planning, if they were to survive the challenges of the 1980s. In the following years Wood expanded her article into a full-length book *Strategic Marketing for Libraries: A Handbook*.^[27] In her introduction, she noted that the combination of marketing and strategic planning “promotes not only strength in the short run, but also the kind of long-term viability needed to work towards each organization’s vision of the future.” Darlene Weingand also published a monograph entitled *Marketing/Planning Library and Information Services*^[28] in which she integrated the ideas of planning and marketing. She emphasized that marketing and planning must be integrated if either is to be effective. Marketing and planning should be integral functions within a library and marketing and planning must be combined in to a “unified whole.” Throughout the book, Weingand stressed that “to be effective, the marketer must understand his environment, must design the products and services the environment needs, must monitor and evaluate their use, and then must build on this process for future planning.” According to her, marketing is a managerial process that must be carefully formulated and thought out. There are many other works which deal with marketing–planning combination in libraries.

In the 1990s the question of quality services in libraries became an important issue in library literature, a problem intimately linked to marketing. SERVQUAL,^[29] a tool to measure quality based on survey methods, became the model for the profit sector but the instrument was not fully applicable in the nonprofit sectors such as LIS. Starting from this model, the American Association of Research Libraries (ARL) developed an adapted instrument called LibQUAL+, and later WebQUAL. The tool was used widely in North American libraries as well as in other contexts, and it has become a useful marketing tool for library managers.

Later librarians began to consider relationship marketing, that is, integrating marketing with customer services

and quality into one stream. Relationship marketing is based on a motion of establishing trust and cooperation with known customers. As a library operates routinely with a known set of customers, this concept is seen as very important for the marketing of LIS. A library also operates on trust. Essentially, it is based on the idea that when a client walks into the library, he trusts that the service provider will find the material or information that he needs. The library in turn, trusts that the client will return the items he borrows within the specified borrowing period.

Table 2 gives a cluster of marketing and related themes that have been covered in literature in the last three-and-half decades. The table is not a complete list of terminologies that were first used during a given decade, but is indicative of trends that have occurred and can thus help to understand the scope of marketing and the way it has changed over the years.

With the impact of technologies and other environmental changes, the role and concept of library services is changing very fast. The range of services that take place outside the physical library is expanding due to the new technology, and it is likely to expand further. Additionally, the scope of some services has become nearly unlimited. Some forms of service can be offered almost as easily around the globe as around the town. Libraries serve and will serve far beyond their walls. All business activities may be seen through marketing lenses. Marketing in case of libraries is necessary to offer benefits to users want, reduce barriers to use and access, persuade and inform the users, and carefully plan to satisfy users’ needs effectively. “Marketing is so basic that it cannot be considered a separate function within the library. Marketing is a central dimension of the entire library. It is the entirety of the library’s operations and services seen from a point of view of its final result, that is, from the customer’s point of view.”^[30]

ROLE OF ASSOCIATIONS

Library associations, both at national and international level have played a vital role in popularizing, promoting role of libraries, their present and potential services, resources, and facilities for the benefit of the community at large. And also in developing their member’s marketing skills, and providing them with support.^[31] (Reference [31] is an extensive review sponsored by IFLA covering areas such as conceptual framework, LIS marketing practices around the world, role of library associations, education, research and training for library marketing, excellence in marketing, literature review, databases, etc., 47 contributors from more than 40 countries have contributed for the volume.) Rigorous efforts have been made by international, national, and regional associations for popularizing marketing through establishing separate sections,

Table 2 Changes in marketing themes.

• Product development • User free • Information brokers • User charges • Market analysis • Information economy • Information utilities • Economic modeling • Pricing • User education	• Marketing products and services • Mega trend marketing • New technology and marketing • Segmentation • Marketing communication • Strategic marketing • Marketing planning • Marketing strategy • Online services • Fee-based services • Fund raising • Fee or free • Information • Marketing through physical environment • Global marketing • Environmental scanning • Library identity • Marketing through your story • Mission statement • Marketing audit	• Costing and pricing • Service quality • Market value • Electronic information service marketing • Positioning • Advocacy • Marketing campaign • Marketing library online • Meaning use and value • Information marketplace • Marketing public relations • Marketing services and products • Part-time public relations • Future-driven marketing • Relationship marketing • Marketing 101 • Savvy marketing • Publicity through Web design • Marketing: A total solution • Product designed and testing	• Performance measurement within marketing frame • Marketing your expertise • Marketing yourself • Think like a business act like a library • Visible librarian: Asserting your value with marketing and powerful public relation and advocacy • Designing brochures • Shy librarian: Marketing and PR • Develop and market a winning collection • Develop and market a winning collection • Card campaign • Focus group • @ your library campaign • Virtual reference • Realistic Marketing • Marketing through blogs

e.g., Management and Marketing Section at IFLA, Advertising and Marketing Section at SLA, Public Relations and Marketing Section at ALA, Publicity and Public Relations Section at Chartered Institute of Library and Information Professionals (CILIP). These associations organize various programs and activities, they issue publications, and they recognize the best practices through awards, etc.

In its programs and activities, the Special Library Association (<http://www.sla.org>) has been giving increased attention to marketing. The SLA Management Division gives training and publishes bibliographies on marketing from time to time, and the SLA Advertising and Marketing Division has a discussion list on the subject (sla-dam@lists.sla.org). Similarly, at the IFLA 2001 Annual Congress in Boston, the ALA launched “@your library”—a new advocacy Campaign for the World’s Libraries. Through this bold initiative IFLA and over 25 national library associations who have embraced the campaign are able to make ALA’s collective and individual accomplishments better known across the world. ALA has also published many useful texts on marketing area.

In Britain, CILIP’s Publicity and Public Relations Group, which was established in 1983, works to make

library and information professionals aware of the value of marketing and PR and also offers a platform for sharing ideas and experiences. CILIP has produced various publications and organizes an annual conference with training workshops and other events; it also produces publicity and promotional material, and rewards excellence in libraries through “*Public Relations and Publicity Award*” (recently renamed as the “PPRG Marketing Excellence Awards”).

Launched in 1997, the IFLA Marketing and Management Section (<http://www.ifla.org/vii/s34/somm>) is made up of library professionals who either work actively in marketing and management in their libraries or teach these techniques to future librarians. Members of this section, who come from countries throughout the world, are working to develop a conceptual basis for marketing in libraries; they also formulate guidelines to teach management and marketing, and they aid LIS professionals throughout the world in their efforts to promote the broader acceptance of marketing. The section also organizes annual conferences and training programs, and it issues publications, including a newsletter. In order to recognize best practices in marketing of library and information sector worldwide, the section created the IFLA International Award in 2001. The work of IFLA’s Marketing and

Management Section illustrates the internationalization of the concept of marketing LIS.

EDUCATION FOR LIS MARKETING

A large part of being an effective librarian involves being an effective marketer. Many successful librarians concede that, as one climbs the organizational ladder, the relative importance of technical skills declines while that of marketing skills increases. Therefore, library schools have realized the need to add a focus on acquiring marketing skills along with the regular quantitative and technical skills in their course curricula. UNESCO confirmed the importance of education when it published in 1988 the "Guidelines for the teaching of marketing in the training of librarians, documentalists and archivists."^[32]

Marketing has been identified as one of the areas of competency that is important for professionals in library and information science in the United States and Canada. However, marketing is not a major area of focus in graduate LIS education. It is certainly the case that library and information science programs must fulfill the role of graduate programs in general, with regard to presenting the theoretical and practical in a range of content areas. In Canada, marketing/advocacy/public relations courses are offered in all seven information science schools. The content of these five LIS marketing courses is comparable to a great extent. However, in regard to objectives, readings, and assignments, there are some distinctive priorities. One course includes an advocacy component affirming the idea that, "advocacy is essentially the marketing of an issue." Finally, an assessment of the state of development of a "public relations and advocacy" course in the seventh LIS school is underway.

In the United Kingdom, management is still strongly represented in the curriculum, with marketing sometimes mentioned as one of the topics covered in a management module. A few specific marketing modules exist. There have been some changes during recent years within the marketing curriculum, reflecting developments in the field. For example, customer relationship management, relationship marketing, and aspects of Internet marketing are now more likely to be taught. CILIP conducts short-term training programs on different aspects of library marketing.

In India, the need for education in marketing LIS was felt in early 1980s. Although marketing was widely discussed in literature, conferences, and many training programs started during 1980s, the inclusion of marketing in the curricula was slow as the University Grants Commission (UGC) Model Curriculum did not lay much emphasis on marketing. Nonetheless some universities and institutions have recognized the need for inclusion of the topic in their syllabi. For example, the University of Bangalore has a full paper on Marketing LIS whereas

University of Delhi has half paper on marketing LIS and in the National Institute of Science Communication and Information Resources (NISCAIR), the topic of marketing of information products and services is covered under the paper on Information Products and Services. However, the role of Indian Institute of Management (IIM), Lucknow in training for LIS is significant. It offers short-term courses for top- and middle-level librarians of all kind of libraries.

In Pakistan, only a few large public, special, and university libraries make use of certain public relations tactics. A course on marketing was first introduced in 1995 by the Course revision Committee of the UGC, but prior to 2002 books on LIS marketing were not included in the list of recommended books. In the year 1999, Islamia University implemented the curriculum recommendations. The University of Punjab introduced the elective course in Marketing of LIS and was made a core course in 2002. In 2001, Sindh University of Hyderabad also started Marketing of LIS course as core course in 2001. Another university, Bahaudin Zikriya University in Multan, has adopted the curriculum of University of Pakistan in 2004.

In France, although marketing is present as a topic in the syllabi of most of the universities, little time is devoted to the study of marketing, and lectures are often given by faculty in fields other than library science. However the topic of marketing is not often offered in continuing education programs given to library or documentation professionals. However, at the national school of library and information science in Lyon (ENSSIB: École nationale supérieure des sciences de l'information et des bibliothèques), there is an online course on marketing strategy available for heads of libraries and documentation services.

In Estonia, among the institutions that prepare information professionals, library marketing is currently being taught both in the curricula of Department of Information Science in Tallinn Pedagogical University and the curricula of Department of Librarianship and Information Studies in Viljandi Culture Academy. In Norway, marketing component in library syllabi is different from university to university. There is very less part of "marketing" or "public relations" or "communication" in curriculum.

These examples from several countries demonstrate that education for marketing among library and information professionals is more and more part of the curricula. However, most of the time it remains an option and is not a core, required topic.

CONCLUSION

Although the idea of marketing LIS is not new, and some progress has been made in the past, more efforts have to be made if we want to see better marketing of a wide range of LIS. In recent years there has been a kind of overconfidence in information technologies, and many

LIS professionals believe that these new technologies will provide a way to make LIS more visible. It is true those technologies are important and librarians, archivists, and other information professionals need to make effective use of technology in order to improve the services to users. Library and information managers need to realize that these technologies are broadening the market and therefore provide immense opportunities to them to offer services and products at the global level. To effectively reach this broadened group of potential users, it becomes imperative that positive attitudes toward marketing be part of the organizational culture of libraries. LIS managers must be aware of and sensitive to marketing in every aspect of acquisition, digitization, sharing of resources, access and delivery, and services to the users. Without a marketing orientation, a high-tech library or information service would not necessarily be successful.

Mathematics Literature: History *[ELIS Classic]*

Barbara Schaefer

Geneseo, New York, U.S.A.

Abstract

One of the objectives of the information disciplines is to study the universe of recorded information—that is, to study the documentary products of domains of human activity—and to come to understand such bodies of literature as social and historical phenomena in and of themselves. Schaefer reviews the history of mathematics from ancient times, and discusses the forms of mathematics literature, and their transformations, through time.

—ELIS Classic, from 1976

INTRODUCTION

The investigation of the literature of mathematics may be placed in perspective by relating the development of the literature to the development of mathematics itself. Throughout the long history of mathematics, the records and communications of mathematicians have taken a variety of forms, depending not only upon the state of the art, but also upon the information needs and the technology at a given time. For these reasons, this description of mathematics literature will begin with a brief survey of mathematics history.

For convenience in discussing the subject, mathematics history will be divided into eight chronological periods, from the prehistoric period to about 1940. The period of contemporary mathematics, which began about the time of World War II, and the literature dating from that time will be discussed in detail in the second half of this article. These historical divisions are only approximations, of course, since ideas tend to overlap and intermingle with the passage of time. They are intended simply as an aid in analyzing the characteristics and accomplishments of mathematics at various stages in history.

THE LITERATURE TO 1940

Prehistory

Knowledge about mathematics in prehistoric times is based largely on conjecture. However, it is generally believed that during that time two general concepts began to emerge from the phenomena of the physical world: quantity and form. The concept of quantity is thought to have started from attempts to compare collections of objects by counting and slowly evolved into a variety of primitive number systems. These number systems became more extensive as exchange and barter

became important. The concept of form probably began as primitive art, with woven patterns in cloth and ornamentation on pottery and buildings. The mathematical aspects of form did not emerge until later; what we would now call geometric figures were simply decorative designs at the time.

5000 B.C. to 600 B.C.

There are sufficient records extant to provide a picture of the mathematics of the early civilizations of the Near East, since the Babylonians wrote on almost indestructible clay tablets and the Egyptian papyrus stayed well-preserved in the dry climate of northern Africa. The quantitative needs of early societies had increased to the point where it was necessary to develop general methods for calculation and to record these methods for future use. The earliest evidence of organized mathematical knowledge seems to indicate the existence of an Egyptian calendar in 4241 B.C. and possibly a Babylonian one before that. By 3000 B.C. the Sumerians had a workable mercantile arithmetic, and texts from the Third Dynasty of Ur (2100 B.C.) indicate a well-developed number system. Texts from the First Babylonian Dynasty show that by 1950 B.C. an elementary algebra had been established. The Babylonians also had a geometry, consisting of formulas for simple areas and volumes, and including recognition of the rule for triangles that is now called the Pythagorean theorem.

The earliest Egyptian source still in existence is the Ahmes Papyrus, written in 1650 B.C. (This is commonly referred to as the Rhind Papyrus, named after A. Henry Rhind, the nineteenth-century English archaeologist who brought the manuscript to England.) This is a practical handbook containing methods of solving types of linear equations, material on unit fractions, mensuration techniques, and problems in elementary series. It may be considered a compilation of the established mathematical

knowledge of that time, since the scribe Ahmes stated that he was copying an earlier work that had been written about 1800 B.C.

Knowledge of early Chinese and Indian mathematics of this period is comparatively poor, since these peoples wrote on bark or bamboo, which was susceptible to decay. The burning of all existing books and the burying alive of all protesting scholars by order of the Emperor Shi Huang-ti of the Ch'in Dynasty in 213 B.C. is another reason why there are so few records from this period in Chinese history. Nevertheless, transcriptions of several ancient treatises have been preserved, among them the "Chou-pei," a dialog concerning astronomy and mathematics. This work, which was written shortly before 110 B.C., contains material on mensurational geometry, the computational principles of the Pythagorean theorem, some elementary trigonometry, and a discussion of instruments for astronomical measurements. Even less is known of Indian mathematics of this period. All that can be said is that there is evidence of a workable number system and an elementary geometry.^[1]

The outstanding feature of all pre-Hellenic mathematics is the complete absence of deductive reasoning. Knowledge was derived from trial-and-error methods, and successful results were recorded and passed on to succeeding generations as formulas. Mathematics before 600 B.C. was merely a tool in the form of disconnected, simple rules derived from experience and immediately applicable to daily life. Mathematics as an organized, independent, and reasoned discipline did not exist until the blossoming of Greek civilization.^[2]

600 B.C. TO A.D. 400

Thales of Miletus (ca. 640 to ca. 546 B.C.), the founder of the Ionian School, is credited with being the first person to speculate about the rules of mathematics. By demonstrating that certain statements of geometry followed logically from previous ones, he contributed to the third phase in the development of mathematics: a science studied for its own sake.

One of the members of the Ionian School was Pythagoras (ca. 570 to ca. 500 B.C.). He later founded his own school at Crotona, a town of Magna Graecia, that contributed greatly to number theory, the theory of music, astronomy, and geometry. Pythagoras was the first to insist on assumptions (axioms or postulates) as the basis for proof, and he offered the first proof of the theorem about right angles that bears his name.

Another interesting figure of this time was Zeno of Elea, a philosopher of the early fifth century B.C., who taught that motion or change of any kind is only apparent. He posed four paradoxes that could not be solved by using the mathematical tools available in his time. His

contribution to mathematics was that he planted an idea that 2000 years later resulted in the development of calculus.^[1]

The study of mathematics, through the influence of Plato and Aristotle, achieved the status of a philosophical science second to none. Their development of logical principles and axiomatic methods put mathematics on a foundation that was considered unshakable until the twentieth century. Attempts to solve some of the famous geometric construction problems that arose during this period, and that remained unsolved until modern times, gave rise to a host of new discoveries.

Probably the most famous figure of this period was Euclid (ca. 300 B.C.), whose greatest contribution was the 13-book treatise, the *Elements*. The *Elements* incorporated all the essential accumulated mathematical knowledge of the time, organized into a system logically deduced from a single axiomatic foundation. The works of Euclid were so comprehensive that they superseded all previous writings, and it is probably for this reason that very few pre-Euclidean Greek manuscripts were preserved.^[3]

During the Alexandrian period, from about 300 B.C. to A.D. 400, Western civilization underwent a change. Greek culture mingled with that of the Orient, and the mathematical center of the Western world shifted to Alexandria. Greek mathematics reached its peak with the flourishing of the School of Alexandria. Two important figures connected with the school were Archimedes of Syracuse (287 to 212 B.C.) and Apollonius of Perga (ca. 260 to ca. 210 B.C.). Archimedes, an astronomer, physicist, and applied and speculative mathematician, made major contributions to number theory, algebra, and geometry. Apollonius, called "the great geometer" because of his important contributions to synthetic geometry, wrote eight books on conic sections, of which seven have survived intact.

After Apollonius, Greek mathematics began its decline, along with the rest of Greek civilization. For the next 600 years, only two important writers stand out among the minor ones. Ptolemy (Claudius Ptolemaeus, ca. A.D. 85 to ca. 165) wrote a comprehensive treatise on astronomy, the *Almagest*, which extended computational mathematics to plane trigonometry and the beginnings of spherical trigonometry. About a century later, Diophantus of Alexandria (ca. A.D. 275) wrote the *Arithmetica*, a milestone in the development of number theory. This work was a blend of Greek and Oriental mathematics, and six of the books have survived.

A.D. 400 to 1400

With the end of Greek civilization, the center of mathematical activity shifted to India, Central Asia, and the Arabic countries.

The Hindus achieved significant results in algebra and arithmetic, but by far their most important contribution

was the development of the numeration system we use today: a place system based on 10 and including a symbol for zero.

Perhaps the greatest contribution of the Moslems was preserving the continuity of mathematical thought. They translated most of the important Greek and Hindu manuscripts into Arabic and spread them in their travels throughout the Arab world. However, two Moslem scholars of this period deserve mention. The first is Mohammed ibn Musa al-Khowârizmî (ca. 825), who wrote two significant books, one on arithmetic and the other on algebra. Only the second still exists in the original Arabic, but both were translated into Latin in the twelfth century. The title of the first in translation is *Algorithmi de numero Indorum* (literally “Al-Khowârizmî on Indian numbers”), which is the source of the term “algorithm.” The second book is entitled *Al-jebr al-muqabala* (literally “Restoration and Opposition”), and by latinization the key word in the title became “algebra.”

There was no mathematical progress in Europe during this time. Throughout the period of the Roman Empire and until the fifteenth century, the language of instruction in Europe was Latin. Despite their contributions in many other areas, the Romans did not produce any significant mathematics and they had carried to Europe only that of Greek mathematics that had practical applications. The only noteworthy Roman mathematician was Boethius (ca. 475 to 524), whose works included an arithmetic, *Institutis arithmetica*, a geometry, *Geometry*, and a treatise on music (considered to be a part of mathematics at that time). His texts were considered authoritative by the European monastic schools and were widely used until the twelfth century.^[1]

It was not until the latter part of the eleventh century that the Greek mathematical classics started to filter into Europe. As trade and travel expanded, the Europeans came into contact with the Arabs of the Mediterranean area and the Near East and with the Byzantines of the eastern Roman Empire, from whom they learned about the Greek works. During the twelfth century the mathematical works that had been translated into Arabic a few centuries before were translated into Latin.

The next few hundred years were a time of absorption of the Greek and Arabic mathematics; mathematical creativity did not resume until the fifteenth century. The emerging European civilization, which had seemed so promising with the founding of the first universities in the thirteenth century, was postponed by the Hundred Years’ War (1337 to 1453) and the Black Death (1347 to 1351).^[2]

The Fifteenth and Sixteenth Centuries

In response to the increasing demands of astronomy, navigation, trade, and surveying, mathematics of this period was concerned principally with computation. The leading

mathematician of the fifteenth century, Johannes Müller (1436–1476), was also an astronomer and he wrote *De triangulis omnimodis*, the first treatise to be devoted solely to trigonometry. The foremost scientist of this age, Leonardo da Vinci (1452–1519), was concerned with the application of geometry to the physical sciences and also to art. His writings on perspective are contained in his *Trattato della pittura* (1651), compiled by some unknown author.

There also occurred during this period two events that laid the groundwork for future mathematical developments: the invention of movable-type printing and the beginning of writing in the vernacular.
